BELBARB

AN *Excellent* SEDATIVE *and* HYPNOTIC

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch f exp P & P CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions In contrast to galenical preparations of belladonna, such as the tincture, Belbarb *has always the same proportion of the alkaloids*

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc

Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 6 minims of tincture of belladonna

Belbarb No 2 has the same alkaloidal content but ½ grain phenobarbital per tablet

CAMEL CIGARETTES

Medical Relations Division

ONE PERSHING SQUARE
NEW YORK 17, N.Y.

Dear Doctor:

You may recall having been asked the question: "What cigarette do you yourself smoke, Doctor?"

In the past few months every physician in private practice in the United States has been asked that same question...asked solely and clearly on the basis of personal preference as a smoker.

Three nationally known independent research groups did the asking in what we believe is one of the most impartial and most comprehensive surveys of physician preference ever conducted.

You may or may not be a cigarette smoker, but we believe you will be interested not only in the results of these surveys, but in the methods by which these results were obtained.

Yours very truly,

A. G. Clarke.

A. G. Clarke
Director
Medical Relations Division

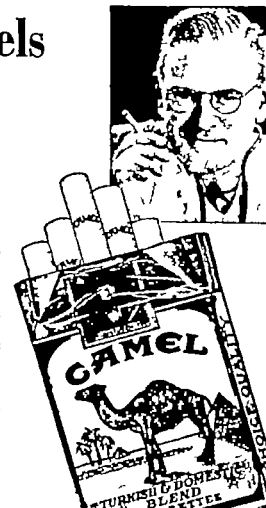
CALEDONIA 5-1910

A physician asked us the question first—

A smoker himself, he asked "What cigarette do most doctors smoke?"

We know that many physicians smoke, that many of them prefer Camels, but we couldn't answer the doctor's query

We turned the question over to three nationally known independent survey groups For months these three groups worked separately each one employing the latest scientific fact-finding methods



This was no mere "feeling the pulse" poll No mere study of "trends" This was a nationwide survey to discover the actual fact and from the statements of physicians themselves

> *To the best of our knowledge and belief, every physician in private practice in the United States was asked "What cigarette do you smoke?"*

The findings, based on the statements of thousands and thousands of physicians, were checked and re-checked

ACCORDING TO THIS RECENT NATIONWIDE SURVEY:

More doctors smoke Camels than any other cigarette

And by a very convincing margin!

Naturally, as the makers of Camels, we are gratified to learn of this preference We know that no one is more deserving of a few moments to himself than the busy physician of a few moments of relaxation with a cigarette if he likes And we are glad to know that so many more physicians find in Camels the same added smoking pleasure that has made Camels such an outstanding favorite among *all* smokers

FOOTWEAR

In Postural Cases

Impressing the layman with the importance of proper clothing in promoting good posture cannot be over-emphasized. Doctors know that proper shoes have a definite effect on posture in both adults and children, but the mere suggestion of an "orthopedic" shoe is enough to make the patient cringe.

"PEDIFORMES", however, because they have a natural appearance, will not make your patient feel "let down" by your prescription for a helpful shoe. Nor will you feel "let down" with the service, courtesy and experience of our shoe-fitters.

INTRODUCING

Combisul - TD

(equal parts of sulfa*thiazole* and sulfa*diazine*)

In one tablet

TO REDUCE RENAL TOXICITY INCIDENT TO SULFONAMIDE THERAPY

Recent experimental and clinical studies[1,2] prove that administration of sulfathiazole and sulfadiazine in combination in equal parts reduces renal complications such as crystalluria, hematuria and urinary tract blockage, and is much safer than either drug used alone in whole dosage. Simultaneously, antibacterial activity and therapeutic efficacy are maintained.

COMBISUL TD presents 0.25 gram sulfathiazole and 0.25 gram sulfadiazine — a total of 0.5 gram per tablet. No signs of renal toxicity have been encountered by use of this mixture and even crystalluria is infrequent. The indications for and dosage of COMBISUL TD are the same as for either drug administered alone. Meningitis is an exception, for which COMBISUL-DM, a combination of 0.25 gram sulfadiazine and 0.25 gram sulfamerazine is available.

COMBISUL-TD available in 0.5 gram tablets. Bottles of 100 and 1000
COMBISUL-DM available in 0.5 gram tablets. Bottles of 100 and 1000

an *exposé* of a basic defect in average milk diets

The *degree* and *extent* in which the milk diets of early infancy are *deficient* in certain vitamin B factors is not always fully appreciated.

" the average breast fed baby does not receive his requirement of thiamine [1]

"Both human and cow's milk are poor sources of nicotinic acid "[2]

"The daily intake (of riboflavin) of the young infant fed only human milk is considerably lower than this estimate of requirement (0.5 mg), even when the riboflavin content of milk is at its maximum."[1]

White's MULTI-BETA LIQUID

is formulated specifically to compensate for these inadequacies, supplying thiamine, riboflavin and nicotinic acid in amounts directly proportionate to their inadequacies, and, in addition pyridoxine hydrochloride and calcium pantothenate

FORMULA:

Each cc. (approximately 20 drops) contains

THIAMINE HYDROCHLORIDE, U.S.P	2.5 mg.
RIBOFLAVIN	500 micrograms
PYRIDOXINE HYDROCHLORIDE	150 micrograms
CALCIUM PANTOTHENATE	200 micrograms
NICOTINAMIDE	10 mg.

Non-alcoholic. Imparts no odor or taste. May be added to feeding formula or orange juice. Supplied in bottles (with droppers) of 10 cc., 25 cc. and 50 cc., and in 8-oz. dispensing bottles.

IN RESTRICTED ADULT DIETS—such as the Sippy treatment, Karell regime and others based upon milk, White's Multi Beta Liquid is a sound economical supplement. Also of value in tube feeding and when difficulty in swallowing tablets or capsules is encountered.

Few Other Foods Can Better This Nutritional Composition

During the recent past much has been learned about nutritional needs The importance of an adequate morning meal has gained wide recognition. That breakfast should be adequate not only calorically, but also in its content of essential nutrients, is advocated by medical as well as nutritional authorities

In the breakfasts recommended, cereals, ready to eat or to be cooked, occupy an important place. For there are few foods that can better the nutritional composition of the dish composed of cereal, milk, and sugar

Besides quickly available food energy, this dish provides notable amounts of biologically adequate protein, the essential B vitamins thiamine, riboflavin, and niacin, and important minerals

The nutritional contribution made by 1 oz of cereal (whole-grain, enriched, or restored to whole-grain values of thiamine, niacin, and iron), 4 oz of milk, and 1 teaspoonful of sugar, is shown in this table of composite averages

Calories	202
Protein	7 1 Gm
Fat	5.0 Gm
Carbohydrate	33 Gm.
Calcium	156 mg
Phosphorus	206 mg
Iron	1.6 mg
Thiamine	0 17 mg
Riboflavin	0.24 mg
Niacin	1 4 mg

The presence of this seal indicates that all nutritional statements in this advertisement have been found acceptable by the Council on Foods and Nutrition of the American Medical Association.

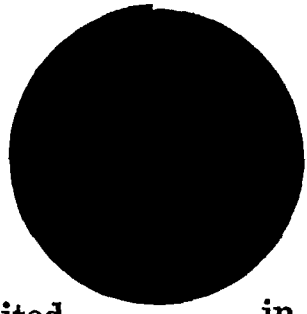
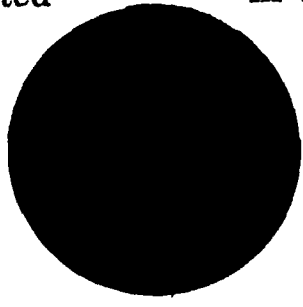
PART-TIME COURSES



Beginning the week of February 4, 1946 for varying lengths of time, in the following subjects:
Advanced Course in Clinical Hematology;
Advanced Course in Ophthalmoscopy (specialists only);
Bedside Clinics in Diseases of Liver and Gall Bladder;
Geriatrics;
Normal and Pathological Physiology of Water and Electrolyte Balance; Surgical Pathology; Venereal Diseases

Full time, five-day courses, Monday through Friday:
February 4–9, 1946: Recent Advances in Diabetes Mellitus;
February 25–March 1, 1946: Recent Advances in Radiology (Specialists only);
March 4–8, 1946: Recent Advances in Neurology and Psychiatry;
March 11–15, 1946: Recent ADVANCES IN Allergy



PART-TIME COURSES

April 1–June 19, 1946: Comprehensive Course in the Elements of Cardiovascular Diseases;
April 1–June 19, 1946: Comprehensive Course in Gastroenterology

Applications should be submitted two weeks prior to opening dates of courses For further information, address the Secretary for Medical Instruction The Mount Sinai Hospital Fifth Avenue at 100th Street, New York 29, New York

united in strength

Concentrated for potency from approximately 7 Gm. fresh liver 7 Gm. rice polishings and brewers' yeast equivalent to 13 Gm. fresh yeast *per teaspoonful*, Elixir OMNI BETA • contains all the known as well as the unidentified factors of the vitamin B-complex. A single teaspoonful daily supplies thiamine 1.5 mg., riboflavin 2.0 mg., niacinamide 10.0 mg., pantothentic acid 1.40 mg and pyridoxine hydrochloride 0.40 mg., plus generous amounts of choline, biotin, para-aminobenzoic acid, inositol and folic acid. Achievement of this well-balanced formula is made possible by utilizing all three of the richest natural sources of the complex to which pure crystalline factors are added. Uniting these primary sources permits ideally simple administration with full scale protection in a single teaspoonful daily

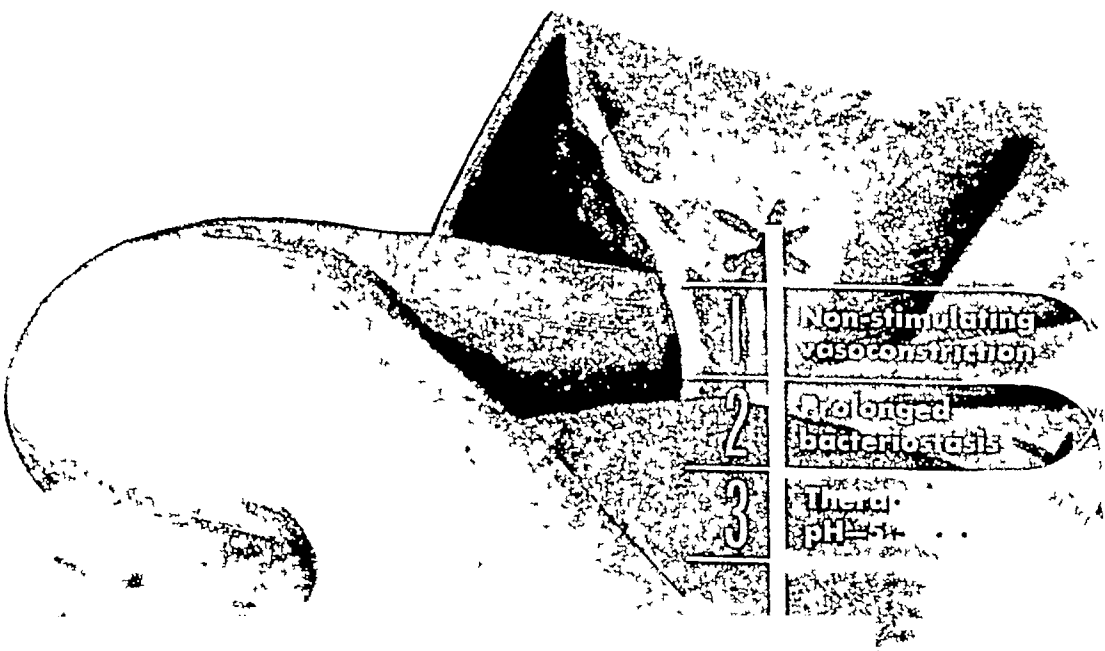
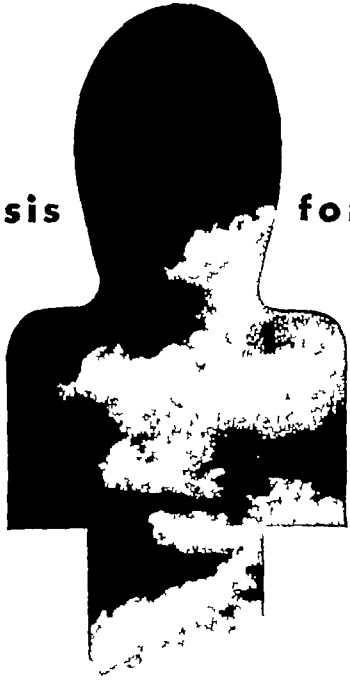
RESEARCH IN THE SERVICE OF MEDICINE

vasoconstriction in minutes



In the treatment of nasal and sinus infections, Paredrine-Sulfathiazole Suspension . . .

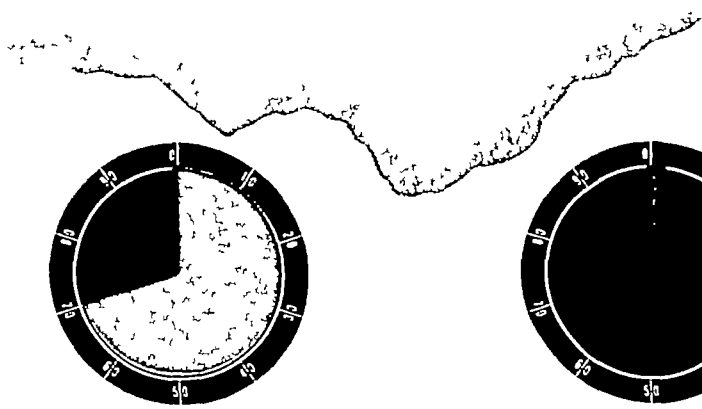
1 Affords more rapid, complete and prolonged shrinkage than that produced by ephedrine in equal concentration Ventilation and drainage are promptly promoted and infected areas are quickly rendered accessible to the sulfathiazole.



2 Provides prolonged bacteriostasis Paredrine-Sulfathiazole Suspension covers the nasal mucosa with a fine, even frosting of free sulfathiazole, which does not quickly wash away, *but keeps producing bacteriostatic action hour after hour* (An objection to solutions of sodium sulfathiazole is the improbability of their remaining in contact with the mucosa long enough to be effective)

Smith, Kline & French Laboratories—Philadelphia, Pa

PAREDRINE—SULFATHIAZOLE



bacteriostasis for hours

SUSPENSION

If in the process of chewing and swallowing, they (the sulfa drugs) come into intimate contact with the gums, pharynx and oesophagus, the possibilities for more effective treatment of gingivitis, stomatitis, pharyngitis and oesophagitis by this means may be opened"

— ARNETT, J H ,
Am J of the Medical Sciences
205 6-8, Jan. 1943

HIGH LOCAL CONCENTRATION One pleasantly flavored Sulfathiazole Gum tablet chewed for *one-half to one hour* promptly provides a high concentration of locally active sulfathiazole (average 70 mg per cent) *that is maintained throughout the chewing period*

LOW (NEGLIGIBLE) SYSTEMIC ABSORPTION Blood levels of the drug, even when maximal dosage is employed, are almost negligible —rarely reaching 0 5 to 1 mg per cent.

product of WHITE LABORATORIES

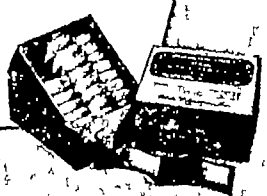
SULFATHIAZOLE GUM*

In Oral and Pharyngeal Infections...

One tablet of White's Sulfathiazole Gum chewed for one-half to one hour—

1 promptly provides a high salivary concentration of *locally active* (dissolved) sulfathiazole

2 that is *sustained throughout the chewing period* in immediate contact with infected oropharyngeal mucosal surfaces,



3 yet even with maximal dosage, resulting *blood levels* remain so low as to be virtually negligible.

Indications Local treatment of sulfonamide-susceptible infections of oropharyngeal areas, acute tonsillitis and pharyngitis, septic sore throat; infectious gingivitis and stomatitis, acute Vincent's disease.

Dosage One tablet chewed for *one-half to one hour* at intervals of one to four hours depending upon the severity of the condition If preferred, several tablets — rather than a single tablet — may be chewed *successively* during each dosage period without significantly increasing the amount of sulfathiazole systemically absorbed

Available in packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes

IMPORTANT Please note that your patient requires your prescription to obtain this product from the pharmacist.

Pharmaceutical Manufacturers, NEWARK 7, N. J.

Dietary Protein after Surgery and Other Trauma

apparently must be maintained at a level above normal in order to assure proper wound healing* and at least average resistance to infection ** The feeding of meat, therefore, in adequate amounts, as soon as it can be instituted, appears doubly advantageous The protein content of meat is high and of highest biologic value, the human digestive tract appears well adapted for handling meat protein **

*" in a variety of medical and surgical conditions there may occur a considerable depletion of body protein owing to a combination of factors, of which the two most important are a generally diminished protein intake and an enhanced protein catabolism This situation inhibits wound healing, renders the liver more liable to toxic damage, impedes the regeneration of hemoglobin, prevents the resumption of normal gastrointestinal activity and delays the full return of muscular strength It is obvious that to meet the situation an adequate supply of proteins and calories must be made available to the body This implies at least 150 Gm. of protein and 3,500 calories, with as much as 500 Gm of protein daily when trauma has been severe, as in serious burns" (Hoff, H E Physiology, New England J of Med 231 492 [Oct. 5] 1944)

**"Cannon cites the evidence which indicates that diminished protein intake lowers resistance to infectious disease, and corroborates it by his own experiments it seems probable that the small intestine is better adapted for handling protein (especially meat protein) than for other types of food It is especially well supplied with enzymes which attack protein, and the digestion of meat has been shown to be more complete than that of foods of vegetable origins" (Crandall, L A, Jr The Clinical Significance of the Plasma Proteins, Memphis Med J XIX 147 [Oct] 1944)

(B) The group treated with ferrous sulfate showed an average daily gain of hemoglobin of 0.83 per cent (0.12 Gm. per cent)—a response about one-third as effective.

(A) The Mol-Iron treated group received an average total of 3.528 Gms. of bivalent iron to produce the sought for result (return to normal blood values).

(B) While an average ingestion of 7 871 Gms. of bivalent iron failed to achieve an optimal response in the ferrous sulfate treated group.

The charts summarize the results of a controlled study of comparative therapeutic response in post-hemorrhagic and nutritional hypochromic anemias.

The series includes 49 cases treated with Mol Iron and 21 with exsiccated ferrous sulfate; the results are typical of those observed in treatment of iron-deficiency anemias with White's Mol-Iron.

A specially processed, co-precipitated complex of molybdenum oxide (3 mg) and ferrous sulfate (195 mg.)

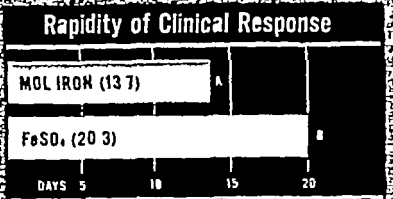
White's MOL-IRON TABLETS

Available clinical evidence indicates that, in hypochromic anemia, the therapeutic response to this highly effective synergistic combination—as compared with equivalent dosage of ferrous sulfate alone—has unusual advantages

1. NORMAL HEMOGLOBIN VALUES ARE RESTORED MORE RAPIDLY, INCREASES IN THE RATE OF HEMOGLOBIN FORMATION BEING AS GREAT AS 100% OR MORE IN PATIENTS STUDIED
2. IRON UTILIZATION IS SIMILARLY MORE COMPLETE.
3. GASTRO-INTESTINAL TOLERANCE IS NOTABLY SATISFACTORY—even among patients who have previously shown marked gastro-intestinal reactions following oral administration of other iron preparations.

INDICATED IN:

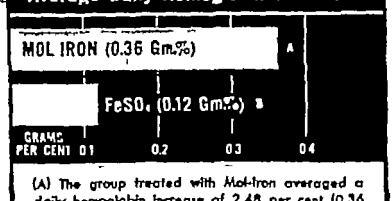
Hypochromic (iron-deficiency) anemias caused by inadequate dietary intake or impaired intestinal absorption of iron, excessive utilization of iron, as in pregnancy and lactation, chronic hemorrhage.



DOSAGE: One or two tablets three times daily after meals.

Available in bottles of 100 and 1000 tablets.

Ethically promoted—not advertised to the laity



WHITE LABORATORIES, INC

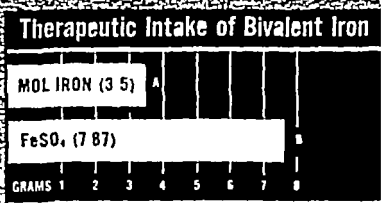
NEWARK 7, NEW JERSEY

A NEW AND DEFINITE ADVANCE IN TREATING IRON DEFICIENCY ANEMIAS



(A) Completely effective therapeutic response (return to normal blood values) was obtained in an average of 13.7 days of Mol-Iron therapy

(B) Ferrous sulfate therapy *failed* to produce normal hemoglobin values after an average of 20.3 days.

(A) The group treated with Mol-Iron averaged a daily hemoglobin increase of 2.48 per cent (0.36 Gm. per cent).

(B) The group treated with ferrous sulfate showed an average daily gain of hemoglobin of 0.83 per cent (0.12 Gm. per cent)—a response about one-third as effective.

(A) The Mol-Iron treated group received an average total of 3.528 Gms of bivalent iron to produce the sought for result (return to normal blood values)

(B) While an average ingestion of 7.871 Gms. of bivalent iron failed to achieve an optimal response in the ferrous sulfate treated group.

New!—a nontoxic, biogenic healing agent—with decongestive action—for Sinusitis—Rhinitis—Coryza

CHLOROPHYLL THERAPY

as provided in **Chloresium** REG. U.S. PAT. OFF **Nasal Solution**

For the first time in the treatment of inflammatory conditions of the upper respiratory tract, it is possible to provide the proven effectiveness of a natural, nontoxic *healing* agent *and* to obtain prompt decongestive relief without actual vasoconstrictor action!

This unique advance in E.N.T therapy is made possible by the use of Chloresium, the chlorophyll nasal preparation which:

1 *Accelerates healing by stimulating cell metabolism*

2 *Affords symptomatic relief* without *vasoconstrictor action*

3 *Promotes normal ciliary function, proper nasal physiology*

4 *Deodorizes by inhibiting the activity of anaerobic, proteolytic bacteria*

Induces Ciliary Activity

Independent investigators have demonstrated that Chloresium Nasal Solution has no detrimental effect on ciliary activity—indeed, it produces partial restoration of the normal ciliary function and aids in establishing proper nasal physiology

Decongestion without Vasoconstriction

Chloresium Nasal Solution has a rather striking decongestive activity which has been reported as an ephedrine like quality *without* any actual vasoconstrictor action Pharmacologic experiments show no evidence of any vasoconstrictor properties. The solution may be used freely, making it particularly useful in the field of pediatrics.

Eliminates Fetid Odors

Chloresium Nasal Solution is extraordinarily effective in eliminating fetid odors—often within 24 to 48 hours—as in Ozena and Atrophic Rhinitis.

Is ethically promoted available at all leading druggists.

NASAL SOLUTION
Iropper bottles and 2-oz. and 8-oz. bottles

M SOLUTION (PLAIN)*
2-oz. and 8-oz. bottles

OINTMENT
1-oz. tubes and 4-oz. jars

ual Solution contains the purified, therapeutic water-soluble derivatives of chlorophyll "a" in an isotonic saline solution suitable for instillation.

Solution (Plain) and Chloresium Ointment contain chlorophyll derivatives. They are used in healing and deodorize wounds, burns, lesions, especially the chronic, recalcitrant

ERTRON

is different

• *Therapeutically and chemically*, Ertron differs from any other drug used today in the treatment of chronic arthritis.

• *10 years* of intensive clinical research has established the efficacy of Ertron in the management of arthritis

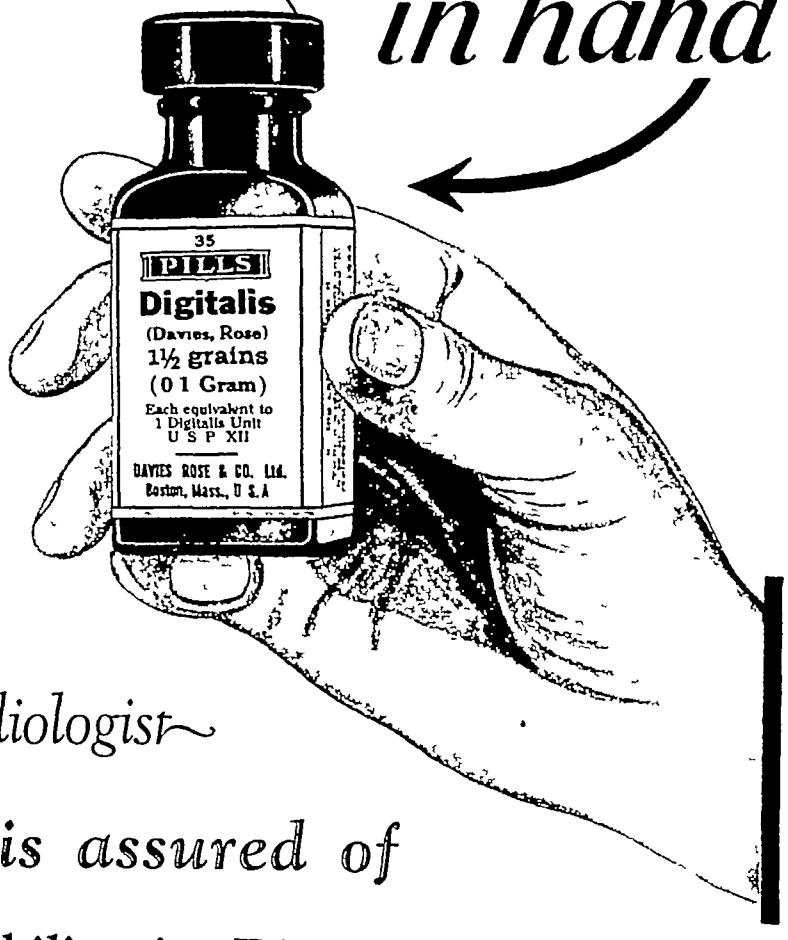
• *5 years* of laboratory research has produced definite evidence that Ertron is chemically different.

Simply stated, Ertron is electrically activated vaporized ergosterol prepared by the Whittier Process

Ertron contains a number of hitherto unrecognized factors which are members of the steroid group The isolation and identification of these substances in pure chemical form further establishes the chemical as well as the therapeutically unique nature of Ertron in antiarthritic management.

Each capsule of Ertron contains 5 mg. of activation-products having a potency of not less than 50,000 U S.P Units of vitamin D

To Ertronize the arthritic patient, employ Ertron in adequate daily dosage over a sufficiently long period to produce beneficial results



The usual procedure is to start with 2 or 3 capsules daily, increasing the dosage by 1 capsule a day every three days until 6 capsules a day are given Maintain medication until maximum improvement occurs A glass of milk, three times daily following medication, is advised.

Supplied in bottles of 50, 100 and 500 capsules
Parenteral for supplementary intramuscular injection

Ertron is the registered trade-mark of Nutrition Research Laboratories

Formulac

for adequate infant nutrition

FORMULAC, newly introduced on the market, is the trade name for a fortified infant food which makes supplementary vitamin administration unnecessary

FORMULAC (a reduced milk in liquid form) was developed by E V McCollum. It is sufficiently supplemented with vitamins and minerals to render it an adequate food for babies. Incorporation of the vitamins *into the milk itself* eliminates the risk of maternal error or carelessness.

FORMULAC presents a flexible basis for formula preparation Supplemented by carbohydrates at your discretion, it may readily be adjusted to fit each individual child's needs.

FORMULAC has been tested clinically, and found satisfactory in promoting infant growth and development

FORMULAC is inexpensive—within price range of even low income groups It is on sale at most grocery and drug stores

FORMULAC IS PROMOTED ETHICALLY

For professional samples and further information about this new infant food, mail a card to National Dairy Products Company, Inc., 230 Park Avenue, New York 17, N Y

3 TREATMENTS IN ONE . . . ARGYROL

in mucous membrane infection

In treating mucous membrane infection today the physician can achieve by use of this one medication ARGYROL *three important results*

For in addition to being contra infective and contra congestive ARGYROL is stimulating to the membrane's own inherent and natural defense function.

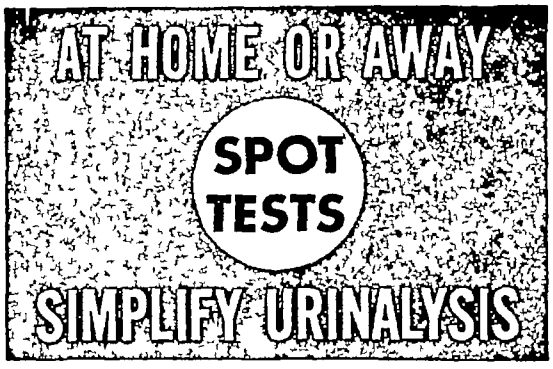
DECONGESTIVE—ARGYROL's decongestive effect in the membrane is the result of its demulcent, osmotic action. The withdrawal of ARGYROL tampons from the post nasal cavities frequently brings forth a long ropy mucous discharge measuring as much as two feet or more.

BACTERIOSTATIC—Although proved to be definitely bacteriostatic, ARGYROL is non toxic to tissue. In nearly a half century of wide medical use of ARGYROL, no case of toxicity irritation, injury to cilia or pulmonary complication in human beings has ever been reported.

STIMULATING—Soothing to nerve ends in the membrane and stimulating to glands, ARGYROL's action is more than surface action. For it acts synergetically with the membrane's own deep-seated, defense mechanism.

NEVER DUPLICATED CHEMICALLY OR IN CLINICAL ACCEPTANCE

Solutions of mild silver protein similar in appearance to ARGYROL are chemically different. Different in degree of colloidal dispersion in size of particles and in Brownian movement viewed under the ultra-microscope In ARGYROL unlike other mild silver proteins and regardless of the concentration of the solution employed the pH remains constant and the pAg is properly correlated Unlike most mild silver proteins ARGYROL remains equally bland and non irritating *in all concentrations from 1 per cent to 50 per cent.* To insure the results which you expect from genuine ARGYROL, it is important that you insist on ORIGINAL PACKAGE ARGYROL.



ARGYROL

THE PHYSIOLOGIC ANTISEPTIC WITH SYNERGETIC ACTION . . .

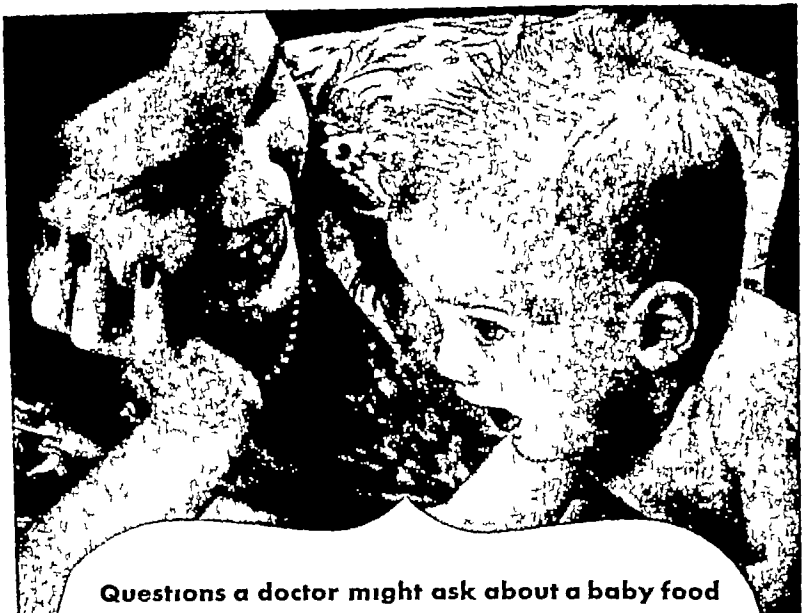
Announcing...

PENICILLIN OINTMENT SCHENLEY



It is possible by topical application to reach local levels of penicillin activity far in excess of the highest ranges maintained by intravenous and intramuscular administration

Penicillin Ointment Schenley is indicated in the treatment of superficial infections of the skin caused by penicillin-sensitive organisms. In deep-seated pyogenic infections with penicillin-sensitive organisms, the ointment may be used as an adjunct to systemic penicillin therapy and other measures.

When you specify Penicillin Ointment Schenley, you are assured of the highest standard of excellence, because Schenley Laboratories maintains the same rigid program of control for this ointment as it has always maintained for Penicillin Schenley.

SCHENLEY LABORATORIES, INC.
Executive Offices: 350 Fifth Avenue, New York City

Questions a doctor might ask about a baby food

Where do your raw materials come from? — Vegetables are grown from seed supplied by Beech Nut. Only that part of the crop which conforms to highest standards is used. Fruits are selected with equal care.

How are these foods processed? — To retain flavor and food values in high degree, all foods are cooked in the absence of air, vacuumed and then pressure cooked in stainless steel cookers. The filled jars are finally processed in pressure retorts.

Can you be sure quality is constant? — Tests for vacuum retention and pH are run on sample jars from each retort after incubation for two weeks at 98°F and 131°F. Flavor, color, consistency are checked continuously in the test kitchen. Cleanliness of plant equipment is controlled by bacteriologists.

"my doctor's nose drops don't sting!"

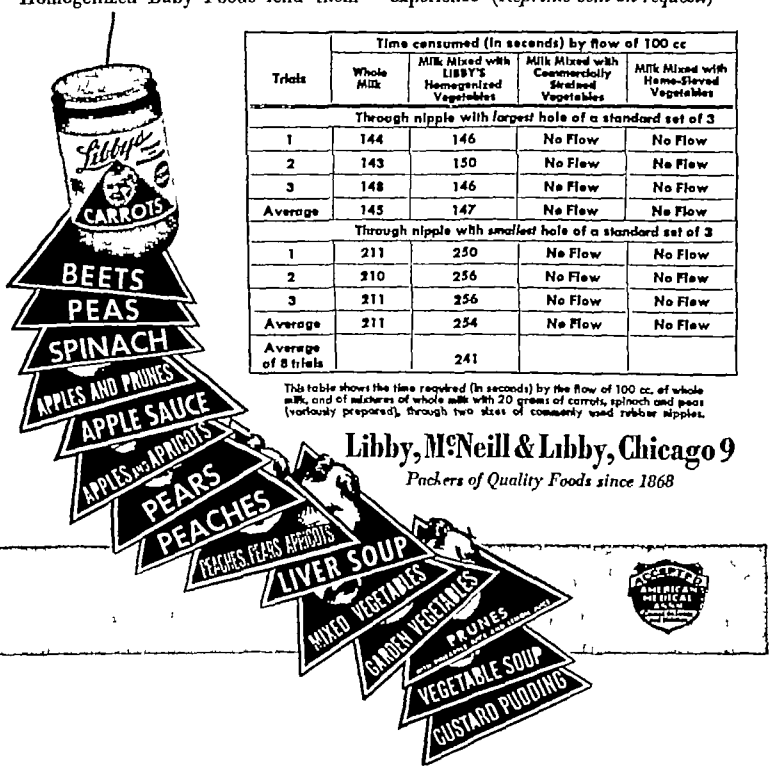
Fussy children with stuffy noses from coryza, sinusitis, or allergic rhinitis are more apt to cooperate when the pediatrician prescribes 'Vaporole' brand Ephedrine Isotonic Solution (Aqueous) to relieve nasal congestion. In its non-oily vehicle of modified Locke's solution, 'Vaporole' Ephedrine Isotonic Solution affords prompt, long-lasting shrinkage of nasal mucosa without inhibiting ciliary action. Because it does not sting little noses it promotes confidence between the physician and his most critical group of young patients.

'VAPOROLE' Reg. Trademark

'VAPOROLE' EPHEDRINE ISOTONIC SOLUTION (Aqueous) containing 1 percent ephedrine in an isotonic solution of sodium, potassium and calcium chlorides and dextrose (modified Locke's solution). Bottles of 1 fluidounce and 1 pint.

BURROUGHS WELLCOME & CO. (U.S.A.) INC., 9 & 11 EAST 41ST STREET, NEW YORK 17, N.Y.

FOR EASILY ADMINISTERED *Early* SUPPLEMENTATION



THE modern trend in infant feeding favors supplementation of the milk diet other than with orange juice and cod liver oil at an early date. Yet this addition has rarely been considered before the infant was able to accept solid foods from the spoon.

It is not necessary to wait until the infant is trained to spoon feeding, since the valuable minerals and vitamins contained in vegetables may be given as part of the milk "formula" Libby's Homogenized Baby Foods lend themselves well to this entirely feasible technic of bottle fed supplementation, they flow freely through a nipple opening of normal size, no other baby food is known to possess this property (See table)

The "smooth" texture of Libby's Baby Foods makes for easier digestion, for greater availability of food iron, and for blandness of cellulose content through fine comminution Thus, supplementation with Libby's is practical as early as the 5th week of life, as shown by clinical experience (*Reprints sent on request.*)

Trials	Time consumed (in seconds) by flow of 100 cc			
	Whole Milk	Milk Mixed with LIBBY'S Homogenized Vegetables	Milk Mixed with Commercially Strained Vegetables	Milk Mixed with Home-Sieved Vegetables
Through nipple with *largest* hole of a standard set of 3				
1	144	146	No Flow	No Flow
2	143	150	No Flow	No Flow
3	148	146	No Flow	No Flow
Average	145	147	No Flow	No Flow

DRYCO
THE "CUSTOM FORMULA"
INFANT FOOD

FROM A CLINICAL POINT OF VIEW

"It must be assumed that every patient with chronic infection is anemic."

For treating hypochromic anemias, Hemo-genin combines the advantages of Fergon (Ferrous Gluconate Stearns) with the nutritional values of vitamin B complex plus liver concentrate. Because Fergon is rarely associated with gastro-intestinal distress, Hemo-genin may be administered before meals to enhance iron absorption.

Hemo-genin

Fergon Plus B Complex

FOR HYPOCHROMIC ANEMIAS REQUIRING IRON AND B COMPLEX

Frederick Stearns & Company
Division

DETROIT 31 MICHIGAN

NEW YORK KANSAS CITY SAN FRANCISCO WINDSOR, ONTARIO SYDNEY AUSTRALIA AUCKLAND, NEW ZEALAND

FACTS ABOUT HEMO-GENIN

COMPOSITION Fergon (Ferrous Gluconate Stearns) synthetic vitamin B complex factors, and liver concentrates. Six capsules daily supply 12 gr. ferrous gluconate and the daily requirements of B vitamins.

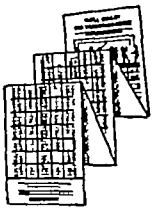
NON-IRRITATING to gastro-intestinal mucosa because low degree of ionization makes it virtually non-astringent. May be administered before meals to facilitate maximum absorption.

GREATER iron utilization shown by clinical comparisons of ferrous gluconate with other iron salts.†

†J. Clin. Investigation 16:43-47 1937.

INDICATED in hypochromic anemias requiring iron and vitamin B complex. Especially valuable when patients do not tolerate other forms of iron.

DOSAGE: Two capsules three times daily before or after meals.



SUPPLIED in bottles of 100 and 500 capsules.

TRADE-MARKS REG. U. S. PAT. OFF.

MALTEX is a hot cereal most every child loves, because it tastes so good—is so rich with tempting, nut-like flavor so deliciously, delicately sweet! What an appetizing way to get nourishment! For Maltex is a wholesome, *two-grain* cereal, naturally rich in Vitamin B_1 —a combination of ripe, golden Wheat, toasted to tasty perfection, and Barley, malted to bring out its delicious flavor The combining process produces "natural" sugars, that are so easy to digest, and give the delightful sweetness that is typical of Maltex's goodness Yes—Maltex is a *good* cereal to recommend to growing children

DUTY CONSCIOUS

Equally Effective in Constipation Colitis Diarrhea

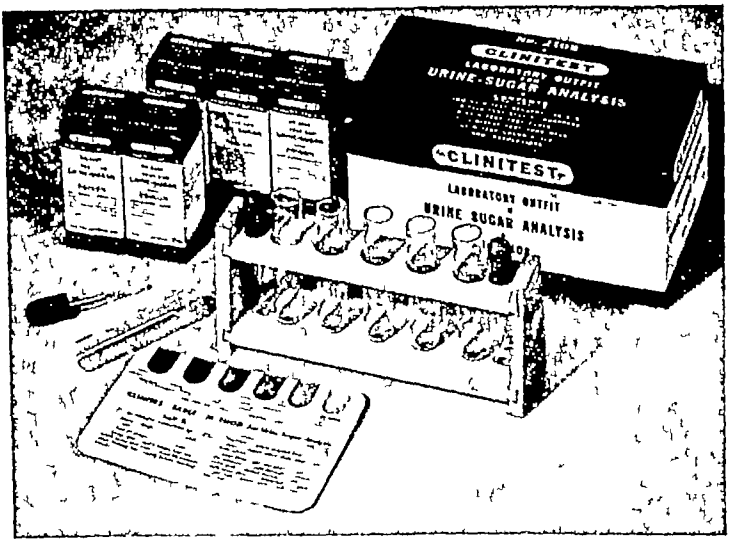
Zymenol Contains Pure Agarose Brewers Yeast (Saccharomyces cerevisiae)

Zymenol makes the bowel duty conscious by maintaining normal intestinal content through Brewers Yeast Enzymatic Action* and aiding restoration of normal intestinal motility with Complete Natural Vitamin B Complex.*

Natural urge to defecate is re-established without cathartics, artificial bulkage or large doses of mineral oil

Economical teaspoon dosage avoids oil leakage and does not affect vitamin absorption

Write for FREE Clinical Size



OTIS E. GLIDDEN & CO., INC. EVANSTON, ILLINOIS

HISTAMINE THERAPY The therapeutic efficacy of histamine in rheumatoid, arthritic and neuralgic affections has been repeatedly confirmed by clinical studies Imadyl Unction 'Roche' combines the potent vasodilating effect of histamine with the dependable analgesic action of salicylates Its application — by simple massage — stimulates sluggish local circulation, brings a pleasant sensation of warmth to the affected area, and markedly relieves pain and discomfort This singular effectiveness of Imadyl Unction makes it a particularly valuable remedy for the relief of rheumatoid, arthritic and neuralgic aches and pains Supplied in 1½-oz. tubes and 1-lb jars

HOFFMANN-LA ROCHE, INC • ROCHE PARK • NUTLEY 10, NEW JERSEY

FOR RELIEF OF RHEUMATOID PAIN **IMADYL UNCTION 'ROCHE'**

Save TIME—LABOR—EXPENSE

—for Yourself and Your Patients

For making office or home urine-sugar determinations, use the simple, no heating, easy tablet method provided by

CLINITEST

Urine Sugar Test

For Your Office—Clinitest Laboratory Outfit (No 2108) Includes tablets for 108 tests, additional tablets can be purchased as required

For Your Patients—Clinitest Plastic Pocket-Size Set (No 2106) Includes all essentials for testing in a small, durable, pocket-size case of Tenite plastic.

what causes sleep?

The easy drone of an electric fan the steady pat-pat of gentle rain on the roof the distant sound of a locomotive whistle dying away in the night . . . any of these may induce sleep for your patients

But there may be occasions—resulting from the effects of various clinical conditions—when ordinary sleep inducements fail to provide satisfactory conditions for rest and it becomes necessary to prescribe a sedative

When confronted with such cases in your practice, prescribe 'DELVINAL' *sodium vinbarbital*—a sedative that will afford your patients a night's refreshing sleep, in the majority of instances, with relative freedom from unpleasant side-effects of excitation or "hangover"

'DELVINAL' *sodium vinbarbital* provides a relatively brief induction period and a moderate duration of action It is Council-accepted

You may prescribe it for the relief of functional insomnia, for general sedation, production of preanesthetic hypnosis, psychiatric sedation, obstetric amnesia, and in pediatrics Supplied in ½ gr , 1½ gr and 3 gr capsules Sharp & Dohme, Philadelphia 1, Pa

SHARP & DOHME

'DELVINAL' *Sodium Vinbarbital*

ON REQUEST: A sample of Menacyl for clinical trial together with a review of over 100 references to the recent literature on salicylate therapy and rheumatic fever

Combating "rheumatic heart"

without PROTHROMBINOPENIA

Menacyl Tablets answer a new pharmaceutical requirement arising from our realization that adequate blood levels of salicylate may prevent the rheumatic heart Medications designed as headache tablets are not suitable for this critical task

Rheumatic fever frequently associates a bleeding tendency and chronically depressed levels of ascorbic acid At the same time, unless protection is afforded as in Menacyl therapeutic blood concentrations of salicylate induce hypoprothrombinemia and excretory depression of plasma ascorbic acid

Menacyl Tablets, a critical drug for a critical indication, obtain prompt therapeutic blood levels of salicylate but protect the prothrombin level and ascorbic acid functions Each Menacyl Tablet provides 0.33 Gm of aspirin 0 33 mg of menadione and 33 0 mg of ascorbic acid In bottles of 100 and 1000 tablets at your prescription pharmacy

Editorial

President Truman's Message

On November 19, 1945, President Truman delivered to the Congress his message on a National Health Program It contained five points Briefly, they are

1 Increased funds for hospitals
2 Increased maternal and child health services
3 Increased funds for medical education
4 A nation-wide system of compulsory sickness insurance
5 Compensation of workers for disability due to illness

The message opens with the figures for rejections for military service of the nearly 5,000,000 male registrants, and adds that among the young women who applied for the Women's Army Corps there was similar disability, and that over one third of the women were rejected for physical and mental reasons

"These men and women who were rejected for military service are not necessarily incapable of civilian work It is plain, however, that they have illnesses and defects that handicap them, reduce their working capacity, or shorten their lives.

"It is not so important to search the past in order to fix the blame for these conditions It is more important to resolve now that no American child shall come to adult life with diseases or defects which can be prevented or corrected at an early age"

With the spirit of this resolution there can be no disagreement It has been the aim of the medical profession for many years It is one thing to resolve, however, and another to accomplish the fact, as humanitarians have learned through the centuries Mr Truman's five points represent the political and economic approach to the ideal, and carry the child well beyond his adolescence

Already legislation is in the Congress to implement the ideal, not, of course, "socialized medicine," just politically controlled medicine, the Pepper bill, the Wagner-Murray-Dingell bill, 1945 edition, the Hill-Burton bill, with others doubtless pending

Of the President's message a correspondent writes

"The results of military draft rejections are among the arguments advanced for a compulsory health insurance measure. To physicians this must appear a futile claim, for how many of

these men would have had the initiative to have had their ailments corrected even under such a plan? No such wholesale determination of diseases which are not self-evident or crippling would stimulate individuals to consult physicians People are very careless and hesitant in such matters—no government edict would change the picture And, as for mental cases, about the number of which there is such a furor, the situation must be approached in a very different fashion

"Mental stigmata and abberations unfortunately are all too frequent, their causes are uncertain and deep, the differentiation between acquired and inherited manifestations may be difficult of solution, moral factors may be forgotten in the effort to attribute them to a medical cause But now a national health insurance scheme will improve and hopefully eliminate these distressing findings among our draftees It is almost too much to expect, yet the President is optimistic All of these distressing factors in our daily lives will be wiped out by the passage of the Bill introduced by Mr Wagner and his associates

"The economic 'bill of rights' so entertainingly featured in the President's message to Congress as a basis for attaining health objectives must be carefully analyzed to determine whether cause and effect are fundamental in the endeavor to achieve adequate medical care for all the people Some of these statements are reasonable—we do need a better distribution of doctors, we do need more housing, sanitation, improved and greater hospital facilities and provisions for scientific research, the high cost of modern medical care is an accepted fact, but can we attain all or any part of these desirable advances by means such as those proposed?"

The Hill-Burton bill has been approved by the A M A subject to certain safeguards The Pepper bill to extend the E M I C program is not, apparently, approved by the majority of physicians, and the Wagner bill seems to be as much "socialized medicine" as its predecessor It is, of course, possible that the doctors could be wrong in their opinions of these measures But be it noted that their adverse opinion is based largely upon the methods by which the objective is to be obtained, not necessarily with the objective itself

Here is a matter which, it seems, has been too little stressed There is a validity in the doctors' objections to these measures which is derived from practical experience They have been at the practice of medicine for a long time They have had their enthusiasms, and have them still They have watched for many years the continent of Europe experiment with socialized medical practice, they are now watching England and New Zealand, and Canada They are not convinced that schemes which do not give sufficient weight to the results of practical medical experience and opinion will succeed Perhaps more attention given to really representative medical opinion would further the President's program faster

A Word to Veteran Medical Officers

Many of you are anxious for separation from the services That is understandable And to all of you, wherever you are, to whom this editorial may come, greetings We know that you feel isolated from your home communities, that the mails are, in many instances, slow in reaching you We can appreciate also the letdown that has occurred since the cessation of hostilities, the overstaffing of certain areas, the time you have on your hands to "gripe", the feeling that what does my county or state medical society care about me in this hole

Yes, you get the JOURNAL, but that is impersonally informative It cannot, as a rule, answer the questions you would like to have answered It may discuss for you the problems that confront organized medicine and some of the proposed solutions But, important as these things are to the profession, they are understandably less important viewed from the vantage point of a small Pacific island, let us say, or from the interior of Germany What you would probably like to know is whether your county society or your state society has forgotten you, personally Will your colleagues be glad to have you back when you come? Will there be enough work to go around?

To attempt to answer the first question, as to whether your county and state society

have forgotten you, it is necessary to know whether or not they have ever really known you It is probably true that you have paid your dues regularly, but how often at meetings have you discussed matters from the floor? On how many committees and for how long have you served? Have you really given your societies the opportunity to know you, not only as a dues-paying member but also as an individual with ideas, a voice, and a personality? If you have done these things it is safe to say that you are remembered wherever you are, because you have given of yourself

Will your colleagues be glad to have you back when you come? Here, again, it depends on the colleagues and on yourself Were they glad to have you in the community before you went away? What did you bring to your community that made it a better place to live in for yourself and your fellow citizens? Not your practice of medicine, for that you were paid, you got something What did you give? How did you think of your colleagues—as competitors only, or as friends? Would you expect them to welcome you at home as a competitor or as a friend? How do you feel about it? How would you act in their place? What would your attitude be had they gone and you remained?

Will there be work enough to go around? More than enough It is true that in many parts of the country there has been more than the 1 1,500 ratio between doctors and civil population, the standard of Procurement and Assignment, which includes all physicians, it is also true that in other parts there has been less than the standard The *adequacy* of medical service is not by any means shown by the mere numerical ratio Says the *Westchester Medical Bulletin* [1]

"The character of the medical service is nowhere indicated by these figures They nowhere show the amount of elective operative work postponed, for example, the quantity of necessary preventive medicine neglected, the curtailment of necessary public health work which should have been expanded, the industrial medical work and education which could have been furthered and vigorously pushed forward, the exploration of new fields in physiotherapy, radiology, tropical medicine The figures of adequacy do not show the efficiency of each medical man, the nonexistent time he has had for study, research, or the proper maintenance of his hospital or private case records, or for that matter, for carrying on the very necessary committee work of his county, state, and national associations The figures do not show the number of scientific meetings he has not attended, the journals he has not read, the number of autopsies he has not attended, the time he has not had available for proper study of developing insurance and hospitalization plans Yet these things all are very important to the adequacy of good medical service, or so it appears to us

"It is fortunate, indeed, that we have been favored between 1940 and 1945 with no severe catastrophies or epidemics, no severe breakdowns of our public utilities or systems of public sanitation Under the circumstances, medical service has been adequate, but it has not been notably progressive or developmental

"From the foregoing it may be surmised that the need of the communities for returning medical officers is acute At the moment of this writing, reconversion is commencing Many of the things pertaining to the production of good medical service which have been sacrificed to the necessities of war will shortly become available new drugs, new hospitals, expanded old hospitals, means of producing and studying new radioactive materials, new diseases, transplanted tropical diseases, expanded industrial health and education services, especially to smaller plants in a decentralized industrial setup

"Your medical societies have imperative need for your presence again among us, we need to be taught what you can teach us, and if, as many of you say, you have time on your hands, how better employ it than in informing us of what you want, what you think the future of medicine ought to be? Many of you are potentially some actually, good writers Are your medical publications as good as they can be, or can you help to improve them?

"The war is over, peace is not yet fully with us Yes, war is wasteful, you have seen it, wasteful of time, of material, of abilities Can you make peace less so? If so, the place to do it is in your home communities where we need you, and the quicker the better Places are no better than the people who inhabit them Of good medical men there can never be enough Come home, when you can, take your coats off, and get to work.

"There are more places than you can fill. Forget your rank or the lack of it, there's work to be done There is better medical service to be made available to more people. You can show us how it can be done, we can help you do it."

[1] September 1945.

Medicine In A Socialist Government

From a correspondent of the A M A in England[1] we learn that

"The socialist government has been sobered by experiencing the responsibilities of office The speeches of its members are full of the difficulties which confront them on the path to the promised utopia of their election addresses and differ little from the addresses made by members of the late government"

The French used to say—it is anybody's guess whether they do so now—"Plus ça change, plus c'est la même chose"—the more change, the more it's the same old baloney, to translate loosely But is it, in the case of the labor government of England? Let us see The A M A 's correspondent writes

"This is illustrated in a speech made by Mr Bevan, the new minister of health, as the guest of the Royal Medico-Chirurgical Association at its annual dinner Mr Bevan said that the framing of a national health service was a task of great perplexity and delicacy in which he invited the cooperation of the medical profession He knew that he had to break down some suspicions, but he was distinctly optimistic and believed that before the end of another year we would have a medical service which would make Britain the envy of other nations A nation which had achieved so much during the last six years would not fail to surmount the difficulties. The war had destroyed many hospitals, and there was a shortage of nursing staff It was the function of the Ministry of Health to provide physicians with the best and the most modern apparatus of medicine and to enable them to use it freely in accordance with their training The individual citizen must be free to choose his doctor, the doctor must be able to treat his patient in conditions of privacy He regarded the general practitioner as the most important man in the medical profession He knew that there were doctors who felt that a state medical service was likely to be too much under the control of a bureaucracy But, though he was a socialist, he believed in industrial democracy and therefore felt that doctors as a profession must have a greater and greater voice in the management of their own services, exactly as he wanted similar power for miners, railway men, and engineers But he was going to do many unorthodox things, to try a number of experiments, in which he hoped to have the cooperation of the medical profession It will be obvious that this declaration of policy is very different from that reported in a previous letter, in which Bevan denounced his predecessor, the conservative minister of health, for surrendering to the medical profession, although he entered into negotiation, the very thing now foreshadowed"

Speeches are one thing and performance is quite another We observe the phenomenon of a labor government in Britain suddenly catapulted into power by an overwhelming popular vote It is sobered by responsibility It is also lacking an adequately experienced machinery to implement its objectives Hence its initial conservatism As it continues in power, develops its forces, will its conservatism endure?

These are things to watch closely We may be faced at any time with such an abrupt change here The world forces which are on the loose are powerful and pervasive The last twelve years have not been noticeable for their conservative nature in American politics, yet we have been able to get along very well, on the whole, with a government not too violently socialistic

The experiment going on in England and the experience of the profession in New Zealand should be studied carefully along with our domestic legislative program It should be remembered that it is incumbent upon the doctors to carry on no matter what kind of an administration the people happen to vote into power We can do so intelligently only if we in the medical profession study contemporary history for what lessons it may hold

If we are to become part of a new (?) world in which the masses of the people, through their socialist representatives, will determine some of the conditions under which the medical profession must work, it seems only sensible to study those representatives and their ideas

The A M A correspondent concludes his report,

"Dr Charles Hill, secretary of the British Medical Association, said in reply that Mr Bevan's human and reassuring speech encouraged confident expectations When Mr Bevan

met the doctors he would find men no less earnest than himself for the health of the people It had become fashionable to regard individual doctors with love and respect and doctors collectively as reactionary and opposed to the public interest

"They would soon, he hoped, be able to convince yet another minister that the profession had the fullest intention and desire to cooperate in obtaining the best possible health service But Dr Hill did not believe that the best public interest would be served by converting an independent profession into a branch of central or local government"

What serves best the public interest is always a debatable question The "public interest" can be invoked as well on one side as the other in speeches Actually, the public may have abrupt and unorthodox ideas as to what constitutes its best interest To the public the profession of medicine can act only in an advisory capacity, it has no power to compel action The government on the other hand has that power within the framework of existing law It therefore behooves the medical profession to develop highly its powers and art of persuasion and to exercise that power and art through the medium of its individual practitioners Their contact with the public is far more intimate than that of any government official

Medicine in this country has only recently been conscious of the necessity for good public relations It is only just learning the art of persuasion If the exercise of this art is necessary under present conditions it will be even more so in the future Mr Bevan said his government was going to do many unorthodox things and to try a number of experiments, just what, he did not say We, here in America, can probably expect a similar tendency We must meet the unexpected and the unorthodox by the development on the part of the medical profession of the best and most cordial public relations with the final arbiter—the people

[1] J.A.M.A. 129: 10 704 (Nov 3) 1945

Part-time Versus Full-time Service

Organized medicine suffers in many respects, as do the armed forces of the several states, from the part-time character of the service Committee chairmen and members, in fact, serve much as field officers and enlisted men in the militia do, after regular business hours one or more nights a week At the top of each organization are a few full-time staff officers, sometimes on the antique side

They are conservative

The high turnover in officers and men has many disadvantages, but it does offer opportunity, at least in the militia, for promotion and advancement In organized medicine, in recent years, at the state and county levels personnel has been so depleted, as in the militia, by drafts of the qualified young men for Federal service that normal replacements of personnel have been lacking and retirements of men over age in grade have been retarded. In neither part-time service does this seem to produce the most highly effective striking force, tactically considered

And yet, notwithstanding the serious disadvantages of part-time service it seems to work and to be suited temperamentally to the American way of life Organized medicine, however, is at a tactical disadvantage, due to part-time service when it has to commit its forces to positive action It cannot convert to a full-time basis Because of this, it must usually think defensively It must use its effectives behind strong points, keep its casualties low, husband reserves Attack requires much good equipment, good communications, good service of supply, and yields a high casualty rate.

Perhaps with the objective in view of better training for a possible offensive action against socialized medicine and "Faced with problems increasing daily, almost hourly in number and importance, the Council on Medical Service and Public Relations of the A.M.A. appeals to each and every county medical society to do everything possible to *hold regular meetings* and maintain an *active organization during* the coming year

"It is hoped that those county societies which have discontinued regular meetings during the war will return now to their regular prewar schedule

"This will be *doubly difficult* in many cases, due to the fact that individual physicians are so busy and so pressed for time Despite the working hours faced by every physician in his private practice *each must sacrifice* a substantial part of his time and effort for medical organization work if the medical profession is to continue to lead in giving the American public the high standard of medical care in the future as in the past "[1]

Many of the supporters of socialized medicine, both within and without the profession, are full-time either with the government, with various foundations, or in university or college teaching Their advocacy of socialized medicine is apt to be full-time also Their personnel is not so subject to change, and not being for the most part in active practice, if in practice at all, they can assail the status quo of the practice of medicine with little to lose and with diluted responsibility for the results as far as the public is concerned Their motivation is all for attack

We think the part-time system is quite apt to prevail for some time yet Revitalized county societies with the young men returned from front-line service, bellies full of government-controlled medicine, to replace the over age in grade conservatives, are likely to change the tactics of organized medicine from the bottom up, to everybody's benefit

[1] *News Letter*, Sept 20, 1945

The Rh Factor in Pregnancy

Much thought and much resultant writing has developed as the result of unfortunate sequelae observed in the transfusions given to women with postpartum hemorrhages When the fact was determined that these were due to the administration of blood from a donor with the opposite reaction to that of the recipient, provisions were developed by blood banks to supply the desired Rh-negative blood for cases in which it was needed It has been estimated that 15 per cent of the white population of this country comes into the Rh-negative group As prevention is one of the keystones of adequate medical practice, would it not be more than desirable if the determination be made in all women married or about to be married? Serologic tests for the detection of syphilis are quite generally accepted as a factor in securing marriage licenses However, the incidence of syphilis among antenatal patients has averaged only about 4 per cent as compared with approximately 15 per cent presenting the Rh-negative factor Marriages among what may be designated as mixed blood groups may end disastrously insofar as child-bearing is concerned The first baby may be normal, but succeeding pregnancies may terminate in repeated abortions or in the birth of a monstrosity (fetal hydrops) Again, the pregnancy may reach term, an apparently normal baby is born, only to become afflicted within a week with that often fatal erythroblastosis.

Available knowledge in these matters is not fully crystallized It is believed that inherent blood types cannot be changed In time adequate means may be devised to overcome some of the effects of these unfortunate matings, including the treatment of the erythroblastotic infant and postpartum hemorrhages in Rh-negative women with the proper blood But whether marriage should be denied to those whose blood types do not match is a question not so easily decided But there should be an awareness of the possible results and means established to detect the condition where it exists

The proposal has been made that when the premarital serologic test is made, it include a reading of the Rh factor in each applicant That may not be feasible at the present time, but at least that would afford some information of value What should be possible is the making of such a test in every pregnant woman at the time of the prenatal examination The necessary procedure is not difficult or expensive, it can readily be mastered Laboratories should arrange to provide it and practitioners undertaking obstetric deliveries should be urged to have it done Hospital services in particular should make it a part of their routine The knowledge thus obtained should prove of great value for its effects in lowering the possible occurrence of this unfortunate outcome of a pregnancy.

TREATMENT OF BLOOD DYSCRASIAS

STUART L VAUGHAN, M D , Buffalo, New York

(From the Buffalo General Hospital and the University of Buffalo)

THE discussion to be given in this paper is intended to summarize the treatment methods being used currently by the author in the care of patients suffering from the common blood disorders In it there is little that is new or original, and full credit is given to the many persons who have contributed to the measures that have been adopted Some of the methods being used are widely accepted as of proved value Others that may prove of value have been neglected purposely, either because they have not been tried, or because trials have not been successful as yet

Before discussing treatment of the various conditions, a general statement must be made Only a very few of the blood dyscrasias are primary in any sense The vast majority of them are secondary to a wide variety of diseases The first step in effective treatment of any so-called blood disease must be accurate diagnosis, not only of the blood condition itself, but also of the entire medical background of the patient Very often the blood condition becomes much less important than the disease producing it.

Anemia

In the treatment of anemia five remedies will be considered, namely, iron, liver extract, transfusion, splenectomy, and treatment of the cause

1 Iron Used as the Sole Therapeutic Measure —This is highly specific and effective in those cases in which it is indicated Obviously, this is used for the individuals suffering from depletion of the iron storehouse. It is a recognized fact that the normal body contains iron in excess of its ordinary needs Practically all tissues contain iron although some of them, such as the liver, spleen, and bone marrow, contribute more to blood formation than others Of great importance in the use of iron is the recognition of the facts that very little iron is lost from the normal body, and that a reasonably normal diet supplies all necessary replacements Iron deficiency develops under those circumstances in which the utilization of ingested iron falls behind the body requirements The commonly encountered circumstances of this type are outlined below, and constitute the varieties of anemia benefited specifically by administration of iron.

(*a*) Hypochromic nutritional anemia of infancy and childhood The iron deficit in this group of patients results from three factors acting singly or in various combinations The first of these is congenital deficiency resulting from the failure of the growing fetus to acquire an adequate supply from a depleted or anemic mother The second is body growth, which rapidly increases the need for iron The third is faulty diet

(*b*) Chronic hemorrhagic anemia The depletion of iron in this condition is easily understood and need for replacement by the use of medicinal iron is apparent However, in this form of anemia, treatment of the bleeding site must receive attention, as will be discussed later Anemia caused by a single hemorrhage usually does not require iron unless complicating factors exist

(*c*) Achlorhydric and related anemias of women Such anemias usually result from blood loss However, this blood loss may be small and physiologic, as in normal menstruation Additional factors, such as achlorhydria or deficient diet, are to be sought to explain the failure to absorb the necessary replacement iron

(*d*) Hypochromic anemia of pregnancy The growing fetus obtains its iron at the mother's expense In this situation other factors, such as inadequate reserves, achlorhydria, and poor diet, play their roles

Administration of iron should be by the oral route Almost any form supplied by reputable pharmaceutic houses is effective The prescription usually written by this author is as follows

℞ Ferrous sulfate—0.3
Such tablets—number 50
One tablet twice daily immediately after meals

For small children elixir of ferrous sulfate in teaspoonful doses twice daily may be substituted

In the treatment of anemia, especially in patients with peptic ulcer, it should be recalled that the use of alkalis prevents the absorption of iron, both dietary and medicinal

2 Liver Extract —This substance, as applied to the treatment of anemia, is the medium for the administration of the antianemic principle This principle is the activated combination of the extrinsic factor from the food and the intrinsic factor from stomach secretions From a theoretic standpoint, at least, a deficiency of the anti-

Read at the Thirty-ninth Annual Meeting of the Eighth District Branch of the Medical Society of the State of New York Buffalo, October 4 1945.

anemic principle may result from several causes, namely

(*a*) Deficiency of the extrinsic factor (nutritional)
(*b*) Deficiency of the intrinsic factor (true pernicious anemia and occasionally carcinomatosis of the stomach)
(*c*) Interference with intestinal absorption (gastrocolic fistula, intestinal stricture, sprue)
(*d*) Interference with storage and activation (liver disease)
(*e*) Interference with utilization (achrestic anemia)

Only three of these are common enough to warrant discussion in this paper

(*1*) Pernicious anemia The diagnosis of this condition cannot be final, even after a satisfactory therapeutic response, until gastric analysis reveals achylia gastrica and other studies exclude gastric malignancy

(*2*) Pernicious-like anemia due to intestinal short-circuiting, stricture, or sprue These conditions are to be considered in cases showing the blood picture of pernicious anemia and normal stomach secretions

(*3*) Macrocytic anemia associated with liver disease In the author's experience this condition is common, but the results of treatment with liver extract are not at all spectacular

Liver extract is most effective when administered parenterally The therapeutic dosage used is ten units weekly until there is complete remission For maintenance the same dose is employed but the interval is increased to meet the needs of each patient The majority of patients require an injection about once a month Patients with pernicious anemia with spinal-cord disease as a complication are treated intensively for at least a year and until all possible improvement is secured This author prefers to use concentrated liver extract As a result of his experience he believes that any hypothetic advantage of large dosage of so-called "crude" extract is outweighed by the increased expense and discomfort He is even more prejudiced against the use of oral preparations containing both liver and iron, as well as other ingredients

3 *Splenectomy* —This operation is to be considered seriously in the types of anemia listed below

(*a*) Congenital hemolytic jaundice It has been curative in all cases in which the diagnosis was definite
(*b*) Acquired hemolytic jaundice In many cases there is no other procedure that offers any chance of saving the patemt While the writer cannot boast of a high percentage of successful results, favorable responses are not uncommon

Transfusion of blood is a dangerous procedure in many types of hemolytic jaundice, and because of frequent sad experiences in the past, this writer has come to avoid the use of transfusion whenever it is possible to do so This is especially true in preparation for splenectomy, and it seems to be far safer to operate upon a patient with severe anemia than to attempt to build up the blood first

(*c*) Splenic anemia Although splenectomy may offer the only hope of relieving the condition, a very high proportion of disappointing results must be confessed
(*d*) Anemia due to essential purpura will be discussed later

4 *Transfusion* —In general it may be stated that this procedure is never specific for any type of anemia Long experience with anemic patients leads to the conclusion that it is used far too frequently On the other hand, it is an indispensable method in certain groups of cases where the indications for it are fairly precise

(*a*) To save life in acute and profound anemia
(*b*) To build up body resistance in some chronic anemias, particularly those resulting from infections that are not controlled readily by other means
(*c*) To prolong life and comfort in some otherwise hopeless anemias

Transfusion is not an entirely safe procedure in the treatment of anemia, and knowledge of its dangers would be helpful in preventing many unfortunate accidents Fatal reactions in profound anemia are not uncommon and this method of treatment is to be avoided if another is available Hemolytic crises in hemolytic jaundice have been mentioned previously Perhaps the most serious consequences result from delaying and masking diagnoses in otherwise curable anemias

5 *Treatment of the Cause* —In the introduction to this paper it was stated that the majority of the blood dyscrasias are secondary The logical inference from this would be that effective and especially lasting results can be obtained only when the primary condition is brought under control It is surprising how often this self-evident fact is neglected in the treatment of anemia Too often the patient is treated for a long time by measures that cannot possibly produce lasting benefit Even more serious is the fact that some patients are actually harmed by injudicious treatment either directly by the treatment itself or indirectly by delaying or mask-

ing the diagnosis of the underlying disease Some examples of anemias in which it seems to be better and safer to postpone treatment until the underlying disease is thoroughly evaluated are given below

Types of anemias in which consideration of the underlying disease should precede the use of iron, liver, and transfusion are hemolytic jaundice, splenic anemia, anemia due to blood loss from hidden sites, anemia due to mechanical abnormality of the intestine, anemia due to operable malignancy, anemia due to intestinal parasites, anemia due to poisons, anemia due to infection, and anemia due to renal insufficiency

Many cases of anemia will not be benefited specifically by any type of treatment. Some of these are listed below Judicious treatment may prolong the life and add to the comfort of the patient, and occasionally a surprisingly good remission may be effected In this group probably one is justified in using all available methods of treatment.

Types of anemia not specifically benefited by any treatment are anemia due to inoperable malignancy, achrestic anemia, sickle-cell anemia, hemolytic jaundice not responding to splenectomy, irradiation anemia, aplastic anemia (of adults), anemia due to incurable infections, anemia due to incurable renal insufficiency, myelophthisic anemia, mediterranean anemia

Polycythemia

It is important to distinguish between polycythemia vera (erythremia) and so-called compensatory polycythemia (erythrocytosis) In the latter the erythrocyte increase is an indispensable part of the mechanism by which the lack of oxygen is compensated Such a condition is seen most frequently in congenital heart disease and in emphysema, and less frequently in mountain sickness, Ayerza's syndrome, and certain intoxications Treatment of the blood condition in these instances is usually contraindicated, although on rare occasions the viscosity of the blood becomes so marked that moderate reduction seems to relieve heart strain Thus may be brought about by the cautious removal of blood

Remedies commonly used for erythremia are phlebotomy, Fowler's solution, phenylhydrazine, and irradiation While the author has found all of them to be effective in restoring the blood to an approximately normal state, he has gradually forsaken all except phlebotomy All of the other methods of treatment have the disadvantages of delayed effect and toxic manifestations Phlebotomy has the advantage of immediate benefit both to the blood condition and to the patient's well-being as well as that of safety In addition, the remissions seem to be fully as prolonged as by any other method, and when relapse occurs the procedure is repeated with equal safety The method used is to remove about 500 cc of blood two or three times each week until the hematocrit reading is approximately normal

Leukemia

In this condition, also, the use of chemical reagents, such as Fowler's solution and benzol has been discarded to a large extent, and the chief reliance is placed upon irradiation and blood transfusion

Irradiation has proved to be most effective in chronic myelocytic leukemia Remissions tend to be rather complete, with both the blood picture and the clinical status returning to reasonably normal levels Such remissions may be of several months' duration, and additional courses of treatment may produce similar remissions While patients differ markedly in the number and duration of remissions, some of them are able to retain fair health and efficiency for many years

The method of treatment has been to irradiate the splenic region with the smallest dosage that produces the remission and then to withhold treatment until a relapse occurs

Chronic lymphatic leukemia usually responds somewhat differently from the myelocytic type While careful treatment may be equally effective in the long run, the same type of complete remission is not as frequently obtained The tendency is to direct irradiation over the involved lymph nodes as well as the spleen Ordinarily it is necessary to carry out treatment more continuously than in the other disease

Other types of leukemia are benefited by irradiation at times Even in acute leukemia small dosage over bones that are painful often gives symptomatic relief However, most cases of acute, subacute, and "aleukemic" leukemia and childhood leukemia not only fail to receive beneficial results, but may be harmed by this measure

Transfusion of blood is the most effective measure used in this latter group In the more prolonged cases of subleukemic leukemia the effects may be excellent while in the others it often fails to give more than transient symptomatic relief Very often one wonders whether the expense is justified in cases in which the prognosis is so hopeless The answer is to be found not only in the frequent direct effect upon the disease, temporary though it may be, but also in the psychologic relief of the frightened patient and his family

Agranulocytosis

Fortunately, the form of agranulocytosis usually thought of as agranulocytic angina seems

to be less frequently encountered than it was a few years ago In the treatment the first consideration must be the elimination of exposure to offending drugs, such as amidopyrines There is doubt as to the effectiveness of pentnucleotide However, in acutely ill patients it should be used in full dosage of 10 cc , intramuscularly four times daily Penicillin or even sulfonamides should also be used in full dosage Of primary importance is oral hygiene Strong reagents and caustics should be avoided at any cost The old-fashioned Seiler's alkaline aromatic solution is a safe substance for thorough cleansing of the mouth and throat Sometimes a weak solution of an oxidizing agent such as hydrogen peroxide diluted with equal parts of Seiler's solution is helpful The author has seen one patient with chronic agranulocytosis fitting the description of primary splenic neutropenia This patient has had a remission of several months' duration following splenectomy

Acute Infectious Mononucleosis

No treatment of the blood is required and the management is similar to that for any other acute febrile disease except that special attention must be paid to the oral cavity in the ulcerative type The therapeutic and prophylactic indications in this connection are identical with those described in the discussion of agranulocytosis

Purpura

Remedial procedures found to be effective under certain circumstances are removal of the cause, local control of hemorrhage, vitamins, transfusion, and splenectomy

1 Removal of the offending cause is to be given first consideration A large proportion of patients suffering from purpura will be found to have some disease or intoxication as the underlying cause Exposure to injurious chemical and physical agents should be discontinued promptly and the possibility of infectious disease must be investigated Some of the conditions causing purpura are not amenable to curative treatment, and when this is the case one can hope for symptomatic improvement only

2 Local control of hemorrhage is extremely important and should be undertaken with vigor, since even comparatively mild bleeding may be so persistent that indirect methods of sustaining life become ineffective Naturally, trauma must be avoided Even such innocent procedures as incising the ear lobe for blood counts and bleeding-time estimations may result in the loss of an excessive amount of blood When a bleeding abnormality is suspected one should discontinue this method of obtaining samples Usually venesection is not hazardous

In epistaxis the patient must be warned against blowing or "picking" the nose Cauterizing treatment is to be avoided Carefully applied packs with drawstrings so that there is firm pressure in both anterior and posterior positions are effective This author prefers not to use epinephrine, but believes that saturation of the packing with rabbit thrombin is somewhat helpful in securing a firm, retractile clot

Bleeding from the gums presents a difficult problem In a few cases in which bleeding from this source was a major consideration successful results have been obtained by the use of pressure dressings beneath plaster-of-paris casts of the jaws made with the cooperation of the dentist

Uterine bleeding may be controlled with uterine packs Here also the rabbit thrombin is recommended Other measures, such as sterilization with x-ray and the implantation of radium into the cavity of the uterus, are to be thought of early Hysterectomy is extremely hazardous, but on a few occasions where this has been done before the seriousness of the hemorrhagic disease was recognized successful results have been observed, although many blood transfusions during the postoperative period were required

Bleeding from the broken skin can be controlled by the use of a sealed pressure dressing, as a rule A small piece of gauze is held tightly against the bleeding surface by an assistant Then the adhesive surface of a piece of adhesive plaster larger than the gauze is covered with a rapidly drying cement* and applied Successively larger layers of similarly treated adhesive plaster may be added to increase the strength of the final dressing

3 Vitamins (*a*) Vitamin C is probably effective only in those cases in which there is a deficiency In the general run of purpura cases no beneficial results are observed after its use However, it is this author's practice to give it more or less routinely with the thought that some degree of subclinical scurvy may be present On rare occasions he has been gratified by the results A very large dosage, 1,000 mg , intravenously, is used

(*b*) Vitamin P (citrin) has received favorable attention in the literature This author is not sufficiently experienced with it to justify his making recommendations

4 Transfusion, as was the case in the anemias, is never specific However, it has several obvious uses in purpura, such as maintaining a satisfactory blood level to carry the patient through an acute crisis, and in preparation for splenectomy Long experience has not shown that uncitrated blood is better than the citrated form

* Vulnofix, manufactured by the Standard Pharmaceutical Co , New York City

5 Splenectomy should be reserved for the cases of truly essential purpura Our best results are in the recurring variety, in which a therapeutic response has been practically universal

The problem of what to do with patients during the *first attack is far more difficult* Even when this attack is prolonged over several weeks or even months there is a good chance that splenectomy will fail to bring about the desired effect This author has become increasingly conservative in recommending splenectomy in these cases, and he does so only when prolonged observation leads to the conclusion that other measures have nothing to offer Under these circumstances some patients respond specifically to splenectomy, some have clinical improvement with no elevation of the platelet level, and others have failed to show any change Fortunately, the mortality rate has been low even in this group Until we have some methods that are more helpful in prognosticating splenectomy response than we have at present one is not justified in expecting more than about 75 per cent success

In acute fulminating cases the problem is even more difficult Only a comparatively few patients are improved, while there is a definite impression that some of these have been saved by splenectomy, there is a similar feeling that some of the others might have survived had it not been attempted

Before leaving the subject of purpura it is well to mention that this author has come to feel that purpura even in its mildest form is potentially very dangerous Every patient showing this symptom deserves exceedingly careful study and management

Hemophilia

Transfusion of blood or plasma improves the coagulability of the blood and probably is of value in the control of a patient during a bleeding episode It is extremely difficult to evaluate its effectiveness in this regard, since the hemophiliac state tends to improve by itself if sufficient time elapses Regardless of the coagulative effect, transfusion may be life saving by virtue of its effect in maintaining a satisfactory blood level

For bleeding from injured skin surfaces the sealed pressure dressings described for purpura are very valuable Local application of hemostatic agents, such as rabbit thrombin, is worth trying and seems to be helpful in some instances However, it should be recalled that these agents exert their effect upon the blood shed over the bleeding surface and probably do not penetrate into the open blood vessels where the clotting is needed most. At best they produce a very superficial plug over the vascular openings

Hypoprothrombinemia

This condition is of several varieties, some cases being due to avitaminosis K, some to liver disease, and some to other and usually poorly understood factors In a general way vitamin K is indicated therapeutically only in patients showing definite prolongation of the prothrombin time Prophylactically it may be employed preoperatively in jaundiced patients and in prevention of hemorrhagic disease of the newly born Probably as the result of the wide publicity given the success of vitamin K in a few important conditions, it has been widely used in cases where it cannot possibly do any good While its use is not attended by any direct harm, there is a notable tendency to employ it to the exclusion of other more valuable remedies

In avitaminosis K due to obstructive jaundice, biliary fistula, intestinal disease, and hemorrhagic disease of the newborn, vitamin K is specific and produces excellent control of the bleeding tendency

In suspected liver disease with hypoprothrombinemia it should be given a thorough trial. In some cases the therapeutic effect is worth while, but even more important is the diagnostic value of the test. Failure to restore prothrombin time to normal under controlled conditions may be regarded as presumptive evidence of liver disease. The intravenous administration of 3 mg or more daily of hykinone, synkamin, or synkavite is the method used by the writer

Preventable Tragedies in the Management of Blood Dyscrasias

During more than twenty years of special interest in patients showing disorders of the blood, the writer has observed many tragedies and freely confesses his fair share of responsibility in many of them Among these tragedies are some that are entirely preventable It seems worth while to call attention to a few that recur over and over again All of these to be mentioned are well-understood conditions and almost, if not entirely, avoidable if reasonable use of accessible facilities is made

1 Carcinoma of the stomach and colon treated solely for the associated anemia until all hope of surgical cure is lost

2 Irreversible disability in spinal-cord disease of pernicious anemia due to missed diagnosis or inadequate treatment

3 Death from injudicious use of transfusion, especially in cases of hemolytic jaundice

4 Disability and invalidism of many years' standing in hypothyroidism treated solely for the associated anemia or the appearance of anemia

5 Agranulocytosis due to the administration of unnecessary drugs

6 Prolonged invalidism in iron-deficiency anemias treated with hypodermic iron, and in pernicious anemia treated with inadequate dosage of oral preparations

7 Mental suffering resulting from too much or too little frankness in explaining the prognosis of serious disease

DDT—ITS MEDICAL AND PUBLIC HEALTH IMPORTANCE

Far-flung changes in the field of preventive medicine to be effected through wider application of the insecticide DDT were predicted recently by Dr Fred C Bishopp, assistant chief, Bureau of Entomology and Plant Quarantine, Agricultural Research Administration, United States Department of Agriculture

Delivering the 1945 Hermann M Biggs Memorial Lecture at New York Academy of Medicine, April 5, Dr Bishopp told of the discovery of DDT and summarized current knowledge of its uses in war and in peace In the opinion of Gen James S Simmons, of the Surgeon General's Office, United States Army, who was quoted by the speaker, " the knowledge gained of this amazing chemical constitutes the most valuable single contribution of wartime medical research to the future health and welfare not only of this nation but of the world "

Dr Bishopp said that insects and related arthropods assume a high rank in importance in the health and prosperity of nations in both peace and war He cited, as exclusively insect borne, some of the world's most dreaded diseases, such as plague, epidemic typhus, and African sleeping sickness He mentioned also Rocky Mountain spotted fever, endemic typhus, scrub typhus, encephalomyelitis, yellow fever, and many other illnesses for which insects, mites, and ticks are wholly responsible Insects that carry or produce plant diseases, that destroy vegetables or fruits, cereals or sugar cane, or that damage livestock or food products in storage often are a dominant factor in decreasing food supplies so that low-income groups or even entire populations suffer from malnutrition and many people die of starvation The devastation of forests and grasslands by insects, which increases the cost of suitable shelters and induces destructive soil erosion, floods, and forest fires, also affects human welfare All insects are not arch enemies of man, Dr Bishopp pointed out Thousands of species may be classed as neutral and other thousands as beneficial

Discussing the part played by DDT in the present war, Dr Bishopp said

"The world-wide struggle in which we are now engaged has given opportunity for every insect-transmitted malady to attack naturally nonimmune groups of men The promptness with which threatening outbreaks have been quelled and the present low incidence of these diseases among our vast armies speak for the effectiveness with which these forces have been brought to bear on disease problems

"The success of the campaign against the typhus outbreak of Naples during the winter of 1943–44 may be credited almost wholly to the new insecticide DDT More than one and a quarter million persons were treated during that winter practically no cases of typhus have occurred among our forces and the introduction into this country of lice and louse-borne diseases with prisoners of war, refugees, and returning troops has been prevented The armies of Great Britain are also making use of DDT against lice, both as a powder and as a clothing impregnant

"Mosquito control is a major factor in the prevention of malaria, dengue, filariasis, encephalitis, and yellow fever, and DDT is coming to play a major role in combating these diseases in our war operations

"One of the most remarkable qualities of DDT as an insecticide is its persistence or residual effect This characteristic may be the one that will give us the whip hand in malaria control When DDT, in solutions or emulsions is applied to wood or canvas as a medium spray at the rate of 200 mg per square foot of surface, mosquitoes resting on such surfaces are killed in a few hours This killing effect persists for several months "

In addition to reviewing these and other wartime applications of DDT, Dr Bishopp prophesied numerous peacetime developments, including farms with contented livestock and cleaner dairy products as results of the use of this insecticide in combating hornflies, stableflies, and houseflies, also outdoor areas with fewer punkies, black flies, and mosquitoes Insect destroyers of crops may be held in stricter control, thus helping to assure ample and economic food production which, in turn, means better general health and happiness

Dr Bishopp said that DDT appeared destined to assume an important role in controlling sand flies and thus in the reduction of the incidence of kala-azar and sand fly fever Tick control also will probably be accelerated materially by the use of DDT This insecticide doubtless will find an expanded field of usefulness in combating flies of all kinds Its persistence on vegetation suggests the possibility of its successful application against the dread sleeping sickness of Africa as well as the infection-carrying eye gnats in various parts of the world This would mean a great boon to peoples of many lands where chronic conjunctivitis, trachoma, and resulting blindness are prevalent -

Although possessing seemingly magic properties as an insecticide, DDT is not a panacea for all ills caused by insects It must be applied by the right method, in the right form, and at the right time. Dr Bishopp warned that due regard must be given to its detrimental effect on beneficial insects and other forms of life whenever its widespread application is contemplated "We must learn more," he said, "about the general field of usefulness of DDT as an insecticide and especially about its limitations Much remains to be done in the perfecting of formulas for diverse uses and methods and equipment for application."—*Health News, April 30, 1945*

OCCURRENCE OF BACILLUS WELCHII GAS GANGRENE AT SITE OF PENICILLIN INTRAMUSCULAR CLYSES

WENDELL MITCHELL, M D , LEON PORDY, M D , and MORTON B WALLACH, M D , New York City

(From the Second Medical Division Goldwater Memorial Hospital)

PREVIOUS reports have indicated that penicillin is of value in the treatment of Bacillus Welchii gas gangrene. However, perusal of the literature discloses no record of gas gangrene occurring during the course of penicillin therapy This case is presented not only because the above complication was present, but because the infection occurred at the site of penicillin intramuscular clyses.

Case Report

X. H , a white woman, aged 51, was hospitalized at Goldwater Memorial Hospital for one and a half years with advanced rheumatoid arthritis which caused her to be bedridden so that she was essentially a custodial problem, furthermore, her course was entirely uneventful until the episode reported below

On April 25, 1945 the patient suddenly developed a temperature rise to 104 F and vomited several times. Detailed physical examination gave no clue as to the cause of the fever Blood count revealed 23,000 leukocytes with 88 per cent polymorphonuclears, 11 per cent lymphocytes, and 1 per cent eosinophiles, hemoglobin was 80 per cent. Spinal fluid and urine were normal and sterile, chest x ray revealed no abnormalities but blood culture disclosed Staphylococcus aureus. The patient was given sulfadiazine but her temperature remained 103 F so that on April 26 100,000 Oxford units of penicillin daily were started and sulfadiazine was discontinued On April 27 a blood culture again showed Staph aureus The next day her temperature varied from 102 F to 104 F and the penicillin dosage was raised to 200,000 units daily All blood cultures after this date were sterile The route of administration of the penicillin was continuous intramuscular clysis into the thighs, alternating the right and left thigh daily, the needle and tubing were changed daily The patient continued to receive 200 000 units of penicillin daily by this method until May 14 1945; during this period from April 25 to May 14, the white blood counts fell from 23 000 to 12,000, although the differential count always showed 86 to 90 per cent polymorphonuclears, her temperature was gradually falling from 104 F to 101 F , with an occasional spike.

On May 14, 1945 tender, swollen, red-hot, crepitant, fluctuant masses, 10 by 10 cm., on the anterolateral surface of both thighs at the site of the penicillin clyses were noted. The clinical impression of gas-bacillus infection was confirmed by anaerobic culture yielding B Welchii from pus aspirated from this area. The patient was given polyvalent gas-gangrene antitoxin in full therapeutic dose intramuscularly (20 vials, each containing 10 000 units of Clostridium Welchii antitoxin 10 000 units of vibrion septique antitoxin 3,000 units of B histolyticus antitoxin, 1 500 units of B oedematiens antitoxin and 1 500 units of B sordellii antitoxin) Wide incision revealed yellow foul, bubbling pus intermingled with large islands of necrotic muscle and debris, the infected areas were flushed with hydrogen peroxide, and activated zinc peroxide was dusted into the wounds daily for one week After this time penicillin drains were substituted for the zinc peroxide in the dressings. From May 14 1945 until June 4, 1945, the patient received 200,000 units of penicillin daily by continuous intramuscular clysis into her deltoids, no infection occurred here Anaerobic culture of her wounds continued to be positive for B Welchii until May 29, 1945, after which they never revealed any growth On the above-described therapeutic regime her total white blood count remained 13 000 but the polymorphonuclears fell to 75 per cent, her hemoglobin fell to 64 per cent by June 1, 1945, so that blood transfusions were given until her hemoglobin was 80 per cent. By June 4 1945, twenty-one days following the diagnosis of B Welchii infection and forty days following the initial febrile episode all systemic penicillin therapy was discontinued The wounds were healing well and penicillin packings constituted the sole form of therapy

Summary and Conclusions

This patient was receiving penicillin for a Staph. aureus septicemia. During the third week of therapy after several sterile blood cultures had been obtained, repeated cultures of pus from areas of crepitation and fluctuation in her thighs at the site of continuous intramuscular clyses, showed large numbers of B Welchii The patient was given a therapeutic dose of polyvalent gas-gangrene antitoxin, both infected sites were widely incised and packed with penicillin drains daily and 200 000 units of penicillin daily was given systemically With supportive therapy, including numerous blood transfusions, the patient made a fairly uneventful recovery

Although penicillin sensitivity of the offending organism and blood penicillin titers were never determined, it is believed that the B Welchii had a high degree of resistance to penicillin, inasmuch as the infection occurred at the site of penicillin injections. However, it is also felt that the organism was susceptible to penicillin, since the patient's clinical course and systemic manifestations during the early part of her gas gangrene before incision and drainage were performed were mild, and since she eventually responded to local and systemic penicillin combined with serum therapy

CONFERENCES ON THERAPY

Departments of Pharmacology and Medicine, Cornell University Medical College and the New York Hospital

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions The questions and discussions involve participation by members of the staff of the College and Hospital, students, and visitors The next report will appear in the March 1 issue and will concern "Oral Penicillin"

The Use of the Mercurial Diuretics

Dr Harry Gold The conference today is on the subject of the mercurial diuretics We have had discussions of the mercurial diuretics in these conferences on several occasions, but the drugs were considered in connection with other topics, namely, the treatment of edema and the treatment of heart failure There was always a tendency to get involved in the problem of edema and heart failure, and in the discussion of various measures, with the result that we failed to get close enough to the particular subject of the mercurial diuretics I think that the mercurial diuretics comprise the most important group of drugs we have today for the treatment of cardiovascular failure I am not sure that there is complete agreement on this point, but I am inclined to rank them at least alongside of digitalis, if not ahead of it in point of importance, in the treatment of heart failure I have a notion that if they were properly used, as many patients would be found to depend on the mercurials for their comfort as on members of the digitalis group There is a large group of patients with early heart failure in whom symptoms are well controlled by the mercurials, but in whom digitalis is of little benefit There is also the large group of patients with advanced heart failure in whom digitalis alone is inadequate and a tolerable state of health can only be established by the supplementary use of the mercurial diuretics Dr William Goldring, of our sister institution, New York University, is here to open the discussion of this very important subject I don't think Dr Goldring needs any further introduction to this group

Dr William Goldring Dr Gold and I are going to be in disagreement on the statement he made concerning the relative importance of digitalis and the mercurials The issues involved may be clarified by the discussions which will follow

The mercurial diuretic in common use now is mercupurin, an organic nonionizable mercurial in combination with theophylline It may be administered intravenously, intramuscularly rectally, or orally There is no significant difference between its effects by the intravenous and intramuscular routes Administration by suppository results in uncertain effect because of variation in the rate of absorption and often produces local inflammation, occasionally ulceration Oral administration is open to the objection of uncertain absorption in addition to the frequency of colic, nausea, and diarrhea

The mode of action of the mercurial diuretics is uncertain, but by the application of the newer measurements of glomerular filtration rate and tubular function, results are obtained suggesting that they act by diminishing tubular reabsorption of water

The dose is variable and should be defined as the least amount required to produce a significant increase in urine volume While, in the case of mercupurin, the dose is often stated as 2 cc injected intravenously or intramuscularly at weekly intervals, actually as little as 0 5 cc may be sufficient and the interval may vary from two days to a much longer period depending on the need Acidifying salts, such as ammonium chloride and ammonium nitrate, may enhance the diuretic effect, but actually they are rarely required

Poisoning may occur in the course of the use of mercurial diuretics It may result from sensitivity to the mercury, dehydration from excessive and prolonged diuresis, or from accumulation of mercury Sensitivity to mercury is perhaps the most reasonable explanation for the prompt appearance of fever, urticaria, or bronchiolar spasm It may account for the occasional sudden and apparently unexplained death which occurs during or immediately after an intravenous injection However, it is encountered very rarely and perhaps can be avoided by administering 0 25 cc intramuscularly as the first dose In the event of fever, urticaria, or bronchiolar spasm within about one hour, a diuretic other than a mercurial should be used

Perhaps the most consistent effect of a mercurial diuretic is the prompt elimination of chloride in the urine Excessive and prolonged diuresis may so deplete the tissue fluids of chloride as to occasionally induce the alarming symptoms of acute salt depletion These symptoms are not unlike those of water intoxication, in which the mechanism is probably the same More prolonged depletion of the salt stores often results in inordinate fatigue This undesirable effect can be avoided by administering the smallest amount of the mercurial required to produce significant diuresis, by avoiding repetition of excessive diuresis, or by giving 2 Gm of sodium chloride by mouth with each injection, when in doubt

The intoxication resulting from the accumulation of mercury gives rise to salivation, stomatitis and diarrhea This can be avoided by administering the mercurial only as long as it is excreted, i e , only as long as each dose produces significant diuresis It is usually a safe plan to give 0 5 cc as the first dose If no increase occurs over the previous day's urine output, give 1 cc If this dose fails wait twenty-four hours and give 2 cc If significant diuresis again does not occur, discontinue the diuretic for about one week.

Then give ammonium chloride, 6 Gm a day, for three days, and repeat the 2-cc dose If again no diuresis occurs, turn to some other diuretic, such as a xanthine or urea.

The clearest contraindication to a mercurial diuretic is acute diffuse glomerulonephritis, either the initial stage or an acute exacerbation The mechanism of edema in these cases is such that it does not appear to be susceptible to the influence of any known diuretic, and the danger of accumulation of mercury is apparent

Proteinuria is not a contraindication for the use of a mercurial diuretic when it occurs in congestive heart failure or in the course of chronic renal disease Nor is microscopic hematuria a contraindication unless it is a manifestation of acute diffuse glomerulonephritis Loss of concentrating power and azotemia in chronic renal disease rarely occur in the presence of marked edema, with perhaps the occasional exception of amyloid disease of the kidneys and intercapillary glomerulosclerosis But even in this rare instance a mercurial may be administered, provided the interval between injections is prolonged in order to permit complete excretion of the mercury by the functionally impaired kidneys There is no reason to believe that a diseased kidney is more vulnerable than a normal kidney to the nephrotoxic action of mercury In fact, it might be supposed that the functionally impaired kidney is less likely to injury, since its inability to concentrate would result in a more dilute solution of mercury in its tubular fluid than in the normal kidney

Obviously, a mercurial diuretic is not indicated for anuria from any cause The action of a diuretic is to mobilize interstitial fluid and present it to a functioning kidney, in no sense can it be expected to reverse any mechanism responsible for anuria, either renal, as in bichloride nephrosis, or extrarenal, as in shock

The value of effective diuresis in clinical practice is principally limited to its effect in left chronic ventricular failure, in extreme and incapacitating edema or serous effusion, and, by no means least, for its psychic effect in patients with moderate edema

A mercurial diuretic cannot be expected to serve any purpose in acute failure of the left ventricle, since its significant effect occurs in about one hour, when the emergency has usually passed Its periodic use may be of some value in minimizing the severity of repeated acute episodes Its value is quite definite, however, in chronic failure of the left ventricle when dyspnea at rest and orthopnea are prominent symptoms In this situation, of course, its effect is enhanced by the concomitant administration of digitalis While the mechanism of its action is not clear, there is good evidence that vital capacity is increased following adequate diuresis In the absence of actual measurement, it may be assumed that effective diuresis reduces pulmonary blood volume and interstitial fluid, and thereby reduces blood pressure in the lesser circulation At any rate it appears in this situation to be an effective adjuvant to digitalis, morphine, and oxygen

Elimination of excessive interstitial fluid becomes imperative when edema is of such proportions that it threatens the integrity of the overlying skin Cellulitis and pressure gangrene are obvious dangers Extensive ascites adds to the patient's discomfort and extensive pleural effusion may seriously impair venous return Unfortunately, in these extreme situations diuretics and digitalis are usually inadequate and it is often necessary to resort to mechanical means of removal of the fluid

The occurrence of moderate edema of cardiac origin or in the course of chronic renal disease does not constitute a prime reason for the administration of a diuretic, since in no sense can repeated diuresis be expected to change the course of the disease or to prolong the patient's life However, it is of inestimable value for its psychic effect, and for this reason it should be considered a highly desirable symptomatic measure In opposition to this view it has been said that reduction of even slight edema is followed by increased efficiency of the heart and peripheral circulation.

Satisfactory proof of this is still lacking Furthermore, one might just as reasonably take the opposite view, namely, that acute increase in blood volume which follows mobilization of tissue fluid might conceivably add to the heart's burden Diuresis is a valuable symptomatic measure in congestive heart failure A diuretic can supplement but it can in no way replace the specific action of digitalis That is where Dr Gold and I differ

It is an interesting clinical fact that the ease with which diuresis occurs is a helpful guide to prognosis in congestive heart failure The immediate outlook is best when diuresis occurs spontaneously on bed rest and sodium restriction It is usually good even when digitalis is required in addition, but distinctly bad when all fail and diuretics are required When diuresis fails to occur after the administration of an adequate dose of a mercurial diuretic to a fully digitalized patient, he rarely survives the current episode of failure

DR GOLD The conference is now open to general discussion I am sure that Dr Goldring's statements have raised many questions in your minds This is the time to probe some of them

DR WALTER MODELL I would like to ask about that last point of Dr Goldring's What has happened in a case in which a patient who has been responding quite well to mercurial diuretics ceases to respond?

DR GOLDRING I have the suspicion that the cessation of response often has to do with depletion of available chloride In at least half of the instances the use of chloride in the form of ammonium chloride or sodium chloride will reestablish the response In the remaining instances it does not The reason for failure of response in the latter group is not clear

DR GOLD In some of these cases a sharp reduction of the salt intake and/or increase in the water intake to 3 to 4 liters a day may help to reestablish the diuresis

DR CHARLES H WHEELER I was surprised to hear that Dr Goldring still finds it necessary often to resort to mechanical means of removal of fluid In this hospital we have practically abandoned thoracentesis and paracentesis because mercupurin removes the fluid so easily We commonly see patients losing 20 to 40 pounds of fluid over a period of weeks from the administration of mercupurin every third day Does Dr Goldring prefer mechanical removal because of the time element or because he has found the mercurial insufficiently ineffective?

DR GOLD How would you handle that question?

DR GOLDRING In extreme cases of pleural effusion and ascites, the patient's comfort is sometimes better served by mechanical remo of a large part of the fluid quickly, treatmen with the mercurial is then continued

DR WHEELER It seems to me that often single injection will remove as much as one ca with a needle We often see 4 or 5 liters com out after a single injection, sometimes as much a 8 or 9 liters, which is as much as one can do wit a paracentesis

DR GOLD. Would it be your idea, Dr Gold ring, that you would do a paracentesis even whe the patient responds to the mercurial, or woul you reserve the mechanical removal of the flui only for those who don't respond to the mer curial?

DR GOLDRING I would reserve it for tw classes—those who do not respond or respond in adequately, and those in whom it seems advis able for their comfort to remove the fluid im mediately

If there has been a diuresis of 9 liters, the dos of mercurial has been too large I think it is un wise to produce such extreme diuresis In case of pleural effusion or ascites, a good part of th fluid lost with such massive diuresis probabl comes from the interstitial tissues as well as fro the pleural or abdominal cavities

DR GOLD It may be 9 liters of fluid lost i both cases, but it is your point that it is no from the same source Are there any othe questions?

VISITOR Do you believe there is any majo danger in using the mercurial in a case of massiv edema in association with chronic diffuse glomerulonephritis?

DR GOLDRING The decision in such cases rests on the question whether the patient can excrete the mercury If the patient develops what you would consider adequate diuresis, the mercurial may be used regardless of whether he has renal disease, chronic heart failure, or hepatic cirrhosis

DR MCKEEN CATTELL You would use it even if the nonprotein nitrogen were high?

DR GOLDRING I would not pay any attention to the nonprotein nitrogen In acute renal disease, however, I would not use it

DR GOLD Is it your idea that there is no contraindication to the organic mercurials, that is, nothing would preclude their use in an individual who needed to have fluid removed by diuresis, except the case of acute diffuse glomerulonephritis?

DR GOLDRING Either the acute stage or an exacerbation

DR GOLD Why would you exclude that?

DR GOLDRING I think the chance of producing diuresis is very small in acute nephritis It may be that the mechanism of that edema is

different, or it may be that the renal circulation is so small that not enough blood reaches the kidney to produce diuresis Under these conditions the mercury may accumulate in the body

Dr. Gold I take it, it is not fear of injuring the kidneys further

Dr Goldring Not primarily But it may injure the kidney if its administration is continued in spite of the absence of diuresis

Dr Gold Dr Goldring mentioned the fact that the mercurial diuretics have no place in anuria from any cause. I wish there were time to discuss this question a bit more fully It is quite clear that if urine is suppressed because it is not filtered, due to destruction of the glomerulus, or due to inadequate renal circulation or to mechanical obstruction, nothing is to be expected from the mercurial diuretic On the other hand, there are cases in which anuria is nearly complete, if not actually so, in which there may well be an unfavorable balance between glomerular filtration and tubular reabsorption I recently saw a patient in advanced heart failure with almost complete suppression of urine, only a few ounces in the bladder in twenty-four hours, in whom large doses of diuretics boosted the urine output to as high as 3,800 cc. in twenty-four hours.

Dr. Wheeler I would like to ask Dr Goldring whether it has been his experience that the mercurials produce less effect in edema of renal origin and in ascites from cirrhosis of the liver than in edema and ascites from cardiac failure?

Dr. Goldring I think the diuresis is probably just as great in either case, excluding acute renal disease.

Dr. Wheeler You have found that patients with ascites due to cirrhosis respond just as well as those due to heart failure?

Dr Goldring Not in the same percentage perhaps. About one third of patients with ascites in cirrhosis respond

Dr. Wheeler What is the reason for the failures? Why is diuresis from the mercurial less common in ascites from cirrhosis of the liver than in heart failure?

Dr. Goldring I don't know I might guess that patients with longstanding cirrhosis who develop thickening of the peritoneal surfaces have a poorer resorptive surface That may not be the entire answer, but it seems a reasonable one.

Dr Cattell Why edema from any cause might respond more readily to diuretics than ascites from that cause is clear enough One would expect that materials distributed throughout the intercellular spaces would be more readily mobilized than in a large bulk of solution in the abdominal cavity

Dr Gold I would like to say something about Dr Wheeler's question There is no doubt of the fact that the mercurial diuretics are effective in clearing up the ascites of heart failure and also the ascites of many cases of primary hepatic cirrhosis There is also no doubt of the fact that, as a group, the ascites of heart failure responds better than that of noncardiac cirrhosis A major factor in producing the ascites in both cases is portal hypertension The portal hypertension is more often reversible in heart failure than in primary cirrhosis In heart failure the pressure in the portal circuit is expected to fall in much the same way as the venous pressure falls in other areas as the result of the initial responses to doses of the mercurials In primary cirrhosis, on the other hand, the portal hypertension is more apt to be the result of structural changes within the liver There are many cases of advanced heart failure in which structural cirrhosis of the liver has developed to such a degree, however, that the failure to respond to the mercurial diuretic is essentially similar to that of the case of advanced noncardiac cirrhosis Here is a specific case A patient with rheumatic heart disease and advanced right- and left-sided failure was maintained in a state of relative comfort by a daily injection of a mercurial for about three years Pulmonary rales, extreme orthopnea, sometimes edema of the lungs, and ascites developed when the injection was interrupted for several days Throughout this time the liver was markedly enlarged, with the edge at the level of the umbilicus. It was very hard and became quite tender only when the injections were interrupted There came a time at the end of about two and one half years when ascites developed and progressed in spite of the daily injections of the mercurials, which still sufficed to keep the patient otherwise dry, without edema or rales in the lungs Abdominal paracentesis now became the only effective measure for the ascites

Here, then, is reversible ascites in cardiac failure and later on, the irreversible stage of ascites in the same person

Hypoproteinemia is a factor which favors ascites, and hypoproteinemia is more frequent and advanced in portal cirrhosis than in cardiac failure.

Dr Wheeler There is this rather sizable group of patients that we have had here with chronic constrictive pericarditis, 17 or 18 of them, most of whom have had marked ascites and in all of whom the mercurials were most effective They removed the ascites rapidly, just as they removed the chest fluid and other evidences of edema. If a mercurial produces a chloride diuresis, why doesn't it do it in every-

body regardless of the cause of the fluid accumulation?

DR CATTELL We are almost driven to assume some special mechanism, such as has been suggested, if we are correct in our understanding of how mercurial diuretics act It is a tubular action I would say, other things being equal, you would expect to get an equal amount of excretion

DR WHEELER That is what you expect, but it does not always happen

DR GOLDRING As I stated, the difference might be due to impairment of resorption through the peritoneal surfaces I don't see where portal circulation has any influence upon the removal of fluid We don't know how the fluid is removed from the abdominal cavity, do we?

DR GOLD We have some information It is a fact that in heart failure and in hepatic cirrhosis portal pressure rises It is also a fact that if it rises beyond a critical point in relation to the osmotic pressure of proteins in the blood, fluid will pass out of the vessels As long as the unfavorable imbalance exists the fluid cannot be drawn back into the blood stream, or is reformed as fast as it is drawn back The diuretic action on tubular resorption in the kidney cannot alter that fact unless the unfavorable portal pressure is largely on a functional basis and is reversed by the initial diuretic effects or some other factors

DR GOLDRING That is entirely reasonable

DR CATTELL If you have a high pressure you would expect resorption through the peritoneal surfaces, would you not?

DR GOLDRING That is probably true

DR MODELL Salt retention may be another one of those reversible factors probably more important in the patient with heart failure than in the one with primary cirrhosis The patient with heart failure retains fluid in part as the result of diminished capacity to excrete salt The salt retention may also be a factor in the development of ascites The mercurial diuretic reverses that trend It increases the capacity of the patient with heart failure to excrete salt It is not clear to me that such a factor would be important in primary cirrhosis

DR JANET TRAVELL Dr Gold, would you say there were any other conditions in which mercurial diuretics are indicated besides those already mentioned, namely, cardiac edema, other effusions of cardiac origin, and the ascites of cirrhosis?

DR GOLD Yes, there are several The mercurial diuretics are indicated in a number of conditions in which the patient appears to be dry There are no rales in the lungs The liver is not enlarged There is no perceptible edema I believe that this group is largely overlooked, and an opportunity for highly effective therapy is missed It is a group in which I believe venous congestion is present but does not manifest itself by the usual physical signs and symptoms It is well known that the extracellular fluid volume may increase to a considerable degree without causing pitting edema Interstitial edema may occur in the lungs without causing rales These patients may present varying symptoms Some have only shortness of breath on exertion Others encounter difficulty breathing at night without an extra pillow or two Some are subject to paroxysms of disordered rhythm, such as showers of premature beats, attacks of auricular fibrillation, or ventricular tachycardia They are patients with heart disease which behaves like heart failure with congestion, for they lose several pounds under treatment with mercurials, and their symptoms as well as the attacks of rhythm disorders disappear I recall one very dramatic case in which we struggled along with large doses of quinidine to keep under control paroxysms of ventricular tachycardia It was barely possible to achieve this by doses of quinidine which kept the patient partially deaf Since there was some shortness of breath even while taking digitalis, a trial at dehydration with mercupurin was made An injection of 1 cc twice a week made the patient lose about 12 pounds of fluid and with that not only the shortness of breath subsided but the paroxysms of ventricular tachycardia disappeared During the subsequent period of about two years the rhythm disorder was absent except for periods when the mercurial was discontinued

There are also patients with coronary artery disease with severe attacks of cardiac pain resulting from coronary insufficiency in whom the capacity for effort without pain is markedly increased by a program of dehydration with the mercurial diuretics, giving injections once or twice a week or even more frequently Patients presenting shortness of breath as well as the pain are more likely to respond favorably Severe attacks of cardiac pain at night in angina decubitus are sometimes relieved, that is, their tendency to recur is prevented, by the mercurial diuretics

DR CATTELL How about pulmonary edema?

DR GOLD The mercurial diuretics are extremely important in connection with the problems of pulmonary edema I think they are more important in acute pulmonary edema than Dr Goldring indicated While the full effect of a dose develops only after several hours, its action begins fairly promptly and speeds up the recovery from an attack of pulmonary edema, which is often a matter of hours, as well as insuring

against relapse A patient presenting a history of recurring attacks of pulmonary edema as the result of failure of the left side of the heart or attacks of cardiac asthma can be almost assured of protection against them over periods of months and years by a systematic program of dehydration which involves an intramuscular or intravenous injection of a mercurial one or more times a week without interruption

Dr Goldring, have you had any of the kinds of experience which I have just described?

DR. GOLDRING In relation to the rhythm cases, were you speaking of patients with rhythm disorders and congestive heart failure?

DR. GOLD I would say yes, if we agree on the meaning of the term "congestive heart failure" In a sense all chronic heart failure is failure with congestion, but the group I am speaking about is the one in whom the usual signs of congestion are absent, namely, pitting edema, rales in the lungs, serous effusions, and enlarged liver What I have tried to indicate is that there are many patients with heart failure with congestion in whom the presenting symptoms are paroxysms of disordered rhythm, or, when there is enough coronary narrowing, attacks of cardiac pain due to coronary insufficiency We miss an opportunity if we don't bear this in mind and distinguish them from attacks of disordered rhythm or attacks of cardiac pain involving other mechanisms, for they sometimes respond in a dramatic way to a program of dehydration with the mercurial diuretics

DR. GOLDRING I have never used mercurial diuretics for these purposes Do you mean that the removal of excess fluid does in some way reverse the mechanism of the arrhythmia?

DR GOLD That's correct. It is well known that rhythm disorders frequently occur in association with heart failure Showers of premature beats in a patient with the garden variety of congestive heart failure disappear when the failure clears up I think that is a very common experience. I am trying to focus attention upon a group in whom the same is true, but in whom the disorder of rhythm is the presenting symptom with the other evidences of heart failure in the background This is the group that is so commonly overlooked Would you agree to that?

DR. GOLDRING I would not, at this moment, unless you assume that in these persons with arrhythmias there is edema in the myocardium itself, and that would just be an assumption

DR. GOLD I am not sure whether the arrhythmias occurring in heart failure are the result of edema of the heart muscle or of cardiac strain or of cardiac anoxia Any of those might so alter irritability or refractory time as to precipitate any of the common disorders of rhythm In any event, the therapeutic test indicates that in some cases the tendency to these disorders disappears when effective dehydration by means of the mercurial diuretics is brought about

DR TRAVELL In those patients with hypertension, what happens to blood pressure?

DR GOLD There is a group of hypertensive patients in whom a few doses of a mercurial diuretic lowers the blood pressure to almost normal levels and in some it can be maintained so for a fairly long time by continued mercurial injections I don't know how to define this group They have longstanding and persistent hypertension They usually have some shortness of breath The heart is enlarged The successful cases practically always develop copious diuresis and lose weight. Have you any experience with that?

DR GOLDRING I never had occasion to use the mercurial for its hypotensive effect Could it be that the patient is put to bed, treated with a diuretic, and the blood pressure falls, not because he received the diuretic but because he went to bed?

DR GOLD No, it couldn't be The observations are better than that. This is the type of observation The patient is in bed on a constant diet. In the control period of a week or two the blood pressure remains fairly constant between, let us say, 240 and 210 A dose or two of the mercurial produces a vigorous diuresis with loss of 6 or 7 pounds and the blood pressure promptly declines and settles down to a level of 140 or 150

DR GOLDRING I have never seen that happen because I have never tried it Again, I would find myself hard put to explain it, if it were true. Have you an explanation?

DR GOLD Not an explanation, but perhaps a partial analogy Reduction of body weight is occasionally effective in lowering blood pressure. It might be the same factor in the case of the mercurial diuretic, although I doubt it is the whole story

DR MODELL Dr Goldring, would you apply the mercurial diuretics as a preventive measure in paroxysmal pulmonary edema?

DR GOLDRING I would, very definitely That is the type I referred to as the patient with repeated episodes of acute left ventricular failure I think it has a distinct value in those I don't think it supersedes digitalis I like to use both in those patients If I had to choose, I would use digitalis

DR GOLD You see, Dr Cattell, before you came in, I expressed the notion that digitalis is in many cases an adjuvant to the treatment with organic mercurials, and Dr Goldring reverses the order He still calls the mercurial diuretic an adjuvant to treatment with digitalis. How about

you, Dr Wheeler, what position would you take in this matter?

Dr Wheeler I don't know I think, in general, I would agree with you, but before I put that in writing, I would like to see some data on the relative numbers of patients with auricular fibrillation and normal rhythm in the two groups I think, certainly, that in a person with auricular fibrillation one is up against it without digitalis

Dr Cattell From the practical standpoint the issue is which to use first

Dr Gold There is no attempt to put digitalis in the shade, but merely to divide the light more appropriately with the mercurial diuretics, in the therapy of heart failure We see so many patients with early and advanced failure, especially left ventricular failure, and especially those with regular sinus rhythm, in whom digitalis produces little or no benefits, but who are rendered virtually symptom-free by the mercurials

Dr Wheeler Dr Gold, do I understand you correctly that you now give the mercurials regularly to all the patients that you see with hypertension, shortness of breath, and a large heart?

Dr Gold I do not do it regularly, but fairly often In a small percentage of cases the lowering of the tension is fairly striking What troubles me is the fact that there are at present no satisfactory criteria for spotting those who will respond well

Dr Travell These patients also lose weight

Dr Gold Yes, they almost invariably lose weight

Some of the patients lose a surprising amount of weight, 8 or 10 pounds of weight loss with several days of diuresis in a person in whom you would hardly suspect a heart-failure problem because of the equivocal degree of shortness of breath

Dr Wheeler I want to ask you whether in those cases of angina decubitus, or paroxysms of fibrillation and tachycardia of one sort or another, you have any information as to an increase in vital capacity along with the benefits?

Dr Gold I have no data, but there are fairly good data regarding the vital capacity after a dose of mercurial

Dr Goldring That evidence is satisfactory The vital capacity increases

Dr Wheeler Wouldn't that be enough to explain the relief in these cases, namely, by reducing anoxia?

Dr Gold I think it might

Dr Goldring One would then be assuming that there is increased pulmonary vascular pressure, not detectable by physical signs

Dr Wheeler Yes, since the vital capacity increases following the diuresis, isn't one safe in assuming that there had been pulmonary congestion, even though there were no rales?

Dr Goldring I think that is quite so

I wonder if we cannot resolve our differences in the discussion regarding the priority of the mercurials over digitalis by restating the issue If you mean that the mercurial is often as effective as digitalis in the treatment of the attack of severe heart failure, I would be inclined to agree, but if we are talking about maintaining that patient after he is out of bed, up and around, and trying to work, then I disagree I think he would return to failure much more quickly having been treated with the mercurial only, than if treated with digitalis only, or preferably with both

Dr Gold If you are going to use both digitalis and mercurials for the purpose of maintenance, the difference in our views loses most of its practical significance However, there appears to be a difference in our thinking about this problem There are, to be sure, many patients with heart failure who are perfectly maintained by digitalis alone, but it is my thesis in this conference that there is a vast group of heart-failure patients in whom digitalis alone maintains them as partial cripples while a program of periodic injection with mercurials restores their health and maintains them at a level of cardiocirculatory efficiency which is truly remarkable I might add that I almost always use digitalis at the same time in these cases, but I have also learned that they frequently do quite as well without it The important point is that they don't do nearly as well without the mercurial

I see an important difference in our views from your statement that the prognosis is poor in a patient who requires the mercurial diuretic That is certainly true about one group of cases, namely, those with heart failure who have been well maintained by digitalis but in whom the condition has gradually deteriorated so that digitalis alone is no longer sufficiently effective, and the mercurial is necessary to remove fluid accumulations These are patients in the terminal phases of cardiac failure The point I wish to emphasize, however, is the existence of another large group, perhaps much larger than the one I have just mentioned, namely, relatively early cases of failure of the left side of the heart, seen most frequently, perhaps, in hypertensive and arteriosclerotic disease, especially in those with a regular sinus rhythm, in whom symptoms may be relatively mild, and in whom digitalis produces equivocal relief There is much in store for the group in the organic mercurials Here the prognosis is not at all poor They may, indeed, late develop a state, as their disease progresses, in which digitalis becomes more helpful, but again in the earlier phases of their left-ventricula

failure, it is the mercurial diuretic given periodically which maintains them in comfort

This about brings us to where we ought to be at this stage of our discussion—plans of dosage in the use of the mercurials The modern plan of treatment of heart failure with digitalis involves two parts—full digitalization and the maintenance dose Most plans for the use of the mercurials do not call for systematic maintenance How do you provide for continuing the gains made by the initial period of treatment with the mercurial diuretics?

DR GOLDRING I would think that the patient who is subject to recurring episodes of acute left-ventricular failure should receive the mercurial at appropriate intervals as long as he has symptoms. If edema reappears at some interval after the last dose of mercurial perhaps he should have another dose If your thesis is correct, every hypertensive patient who is not comfortable when he lies flat perhaps should have mercurials just as long as he is uncomfortable.

DR CATTELL In the case of digitalis, you don't wait for return of symptoms Is there a different philosophy there?

DR. GOLDRING I think the difference is that we don't know enough about the action of the mercurials There is some natural hesitation in giving a nephrotoxic substance without clear indications I think that when we get to know more about it, the principle of the maintenance dosage may be applied as we now do in the case of digitalis

DR. GOLD I agree that we are far from knowing all that we should about the mode of action of the mercurial diuretics, and there are isolated instances in which patients critically ill with cardiorenal failure have shown an unfavorable response, even though effective diuresis occurred, possibly because of excessive diuresis.

However, in the past few years, we have applied the principle of the maintenance dose to mercurial diuretic therapy, and it seems to us, successfully Can you see any particular objection to it?

DR GOLDRING I see no objection to that at all except that I think a great deal of that therapy would be wasteful because the indications are not sufficiently clear right now

DR GOLD It ought not to be any more wasteful than expert digitalis therapy Consider this illustration of the method The patient has organic heart disease Shortness of breath on exertion or orthopnea has developed, and you have decided it is due to failure of the left side of the heart You prescribe digitalis, with only partial or negligible improvement In either case you give the patient a dose of the mercurial diuretic He loses weight. His symptoms begin to subside You continue the daily injection until the patient reaches what one might call the "dry weight." The interval between dosage is then prolonged in the endeavor to maintain the dry weight Let us say, if the weight remains unchanged after three days but rises by the fourth day, the interval between doses should be three days, if it remains down for six days but begins to climb on the seventh day, the proper interval should be six days The idea is to discover the longest interval between injections which will suffice to keep the patient's weight from rising materially above the low level reached in the initial treatment. The necessary interval between doses may turn out to be a week to ten days or longer in some cases, only a day or two in others The method of trial and error has to be applied here, as in the case of establishing the maintenance dose of digitalis The initial period of this treatment does not always require as concentrated a schedule of daily injections as I have indicated, but such a schedule is very satisfactory in a great many Changes in the regimen are, of course, made depending on the patient's reaction to the initial doses Would you approve of such a plan of therapy?

DR GOLDRING I don't think I would in the present state of knowledge I don't think that you can possibly tell that the gain of a few pounds on the seventh day in your illustration is due to increased accumulation of fluid or good body weight.

DR. GOLD It is my experience that one usually can distinguish between gain of good body weight and gain by water accumulation. The distinction is much easier in some cases than in others, to be sure, as it is easier in some cases than in others to determine the proper maintenance dose of digitalis The gain by water accumulation is very apt to be fairly abrupt The patient will have maintained a daily weight, let us say, of 135 pounds, and then present a weight of 137 or 138 pounds on the fifth or sixth day Such an abrupt change is not apt to be a normal weight gain in these patients There are instances in which the weight gain is more gradual, and in these it is often well to follow the rising curve for several days, and if it continues to rise, give a dose of the mercurial to see whether it does not restore the weight to the previous low level A few experiments of this kind will soon establish the pattern of the patient's response There is, of course, no denying the fact that over a more protracted period of time the patient may gain body weight which is not due simply to fluid accumulation, but such testings as I have indicated will help to recognize this type of gain

DR GOLDRING You are making one assumption that I cannot see at the moment, namely,

that the accumulation of small quantities of fluid impairs the efficiency of the circulation If you can prove that I would be agreeable to such a plan of treatment

DR GOLD No, I am not making that assumption I am only taking the stand that when the patient with heart failure begins to accumulate body fluid, he has entered upon a course which he is not likely to interrupt without some help, until enough fluid has accumulated to produce symptoms of failure That being the case, our program calls for preventing this occurrence by a dose of the mercurial which will keep the body weight from rising in terms of fluid accumulation The situation is strictly analogous to the ventricular rate in digitalis therapy of the patient with auricular fibrillation We try to keep the rate at about 70 beats a minute The patient does not necessarily feel ill when the rate rises to between 90 and 100 a minute, nor is there any likelihood that the faster rate is impairing the efficiency of the circulation Yet when the rate rises to such levels, we regard the maintenance dose as too small and are inclined to increase it on the basis of the view that a rising rate is an indication of trouble ahead If one substitutes the words "body weight" for the words "heart rate," what is said in principle about the maintenance dose of digitalis is applicable to the maintenance dose with the mercurial diuretics

DR CATTELL Wouldn't you think that in principle constancy would be better than fluctuations in the patient's condition, even though the fluctuations might not produce symptoms?

DR GOLDRING I think you have a good idea that some day will be developed, but we have got to know a lot more I am just opposed to treating in the dark I don't think these situations are strictly analogous If the optimum heart beat is 80 a minute, that is where it ought to be kept If it goes above that, the circulation becomes inefficient The fact that the patient has gained some pounds of weight is not necessarily an indication that his circulatory apparatus is inefficient because of that

DR GOLD Aren't you reversing the physiologic order of events? The rate of 100 a minute in the fibrillator does not make the circulation inefficient The rapid rate is merely an indication of the fact that the heart is inadequate We give more digitalis to produce greater increase in the systolic force and we get indication of the improved state from the fact that the heart is able to carry on with a lower rate of 80 or 70 a minute

Again, body weight in the case of the mercurial diuretics serves the same purpose as heart rate in the case of digitalis An increase in either within limits doesn't harm the circulation nor cause symptoms, but each is, in its own way, proof of events likely to progress to advanced failure

DR GOLDRING You are taking the position that a mercurial diuretic, when it is effective, improves circulatory efficiency, aren't you?

DR GOLD Yes, indeed

DR GOLDRING And that is something I am not prepared to say yes to right now

DR GOLD There are the experiments of Blalock, Pilcher, and Harrison which suggest that edema impairs oxygen exchange in the tissues, creating a demand for more circulation Here, then, is a source of cardiac strain which may precipitate failure

VISITOR What happens to a patient with auricular fibrillation and congestive failure who is treated with the mercurial diuretic alone without digitalis?

DR GOLDRING He probably would become free of edema, but the symptoms would continue The dyspnea, orthopnea, and the ventricular rate would tend to continue at about the same level The fibrillation would persist I think he would be a lot better, but I feel that when he gets up and about and tries to do something, having no digitalis, he would be back in failure pretty promptly

DR GOLD Would that happen even though the mercurial were continued when he is up and about?

DR GOLDRING That is something I have never done That would be in line with your thesis Maybe you can answer that

DR GOLD It is our experience that a patient in advanced heart failure often responds to the mercurial in a manner indistinguishable from the response to digitalis The heart rate may slow, the venous pressure may fall, the vital capacity may increase, edema, hydrothorax, and ascites may disappear, and dyspnea, orthopnea, and all other failure symptoms subside It is not true in all cases, but in many the end stage of recovery from failure is the same with either drug The primary point of attack on the vicious cycle of failure is obviously different

And what is more, a proper program of continued mercurial medication may maintain the gains very well when the patient is up and about, and working

DR MODELL We have done that in our clinic They can get along very well

VISITOR Does an individual without cardiovascular disease respond with diuresis to administration of the mercurial?

DR GOLD Yes It produces a moderate diuresis in normal people Isn't it so?

DR. GOLDRING Oh, yes

VISITOR I just wanted to know whether it is edema fluid or something else the patient loses when you get down to the "dry weight"

DR GOLD I can't see what else it might be, since edema is merely an increased amount of the normal extracellular fluid

VISITOR About how much will a normal person lose?

DR GOLD A so-called normal person may lose 3 or 4 pounds after one injection, but some lose little or none The normal extracellular fluid content is about 15 per cent of the body weight. It amounts to about 20 pounds for an average person of about 150 pounds The amount shows great fluctuations under physiologic conditions A suitable distribution of about 10 extra pounds of this fluid in a patient with heart failure might show none of the usual signs of edema, but can cause symptoms which promptly subside when the mercurial removes it

DR. MODELL I wonder if I could say a word about toxicity Dr Goldring indicated that in case the patient is hypersensitive to the mercurials, ones hould turn to nonmercurial diuretics Perhaps it would be well to point out that the hypersensitivity does not apply to the mercurial itself, but to the whole molecule, and since the structures of the several mercurial diuretics differ, it is to be expected that a patient hypersensitive to one may tolerate another without trouble That accords with several of our experiences We have seen patients who developed hypersensitivity reactions to mercupurin, mercuhydrin, and to salyrgan theophylline, but who were able to take one or another of the compounds without these reactions It is well to bear this in mind before the use of the mercurials is abandoned in any particular case

As to mercury poisoning, I don't think we have ever seen a case with unequivocal signs of mercurialism during the use of the mercurial diuretics

DR. GOLDRING I have never seen a case of mercury poisoning with mercupurin, but there are many instances of it seen with novasurol and with salyrgan

DR GOLD We have never seen a case of acute mercurialism with the classic signs of stomatitis and ulcerative colitis after either mercupurin, mercuhydrin, or salyrgan with theophylline Our experience now comprises several thousand injections It must be very rare if it occurs Every now and then there is a report of a suspicious lesion in the kidney, although we have never encountered it.

STUDENT Is mercupurin contraindicated in the treatment of edema that is associated with the toxemias of pregnancy?

DR. GOLD That is one for you, Dr Goldring

DR. GOLDRING I don't think contraindication is the proper word I think it is perfectly useful if the objective is to get rid of fluid It could be used as long as it is excreted As long as diuresis occurs there is no danger from the cumulation of mercury

DR. GOLD I think Dr Goldring has already said that there are no contraindications to the use of the organic mercurials, and I suppose that would include all conditions with the exception of the one he mentioned, acute glomerulonephritis, in which it is not excreted

VISITOR Dr Goldring referred to the mercurials as nephrotoxic substances Is there evidence that shows it?

DR CATTELL Do you think there is any difference in the action on the kidney between free mercury and the organic mercurials?

DR. GOLDRING I don't know That is a question I would like to ask you

DR WHEELER Isn't it true that the amount of mercury in the mercurial diuretic is minimal? How much mercury is there in 2 cc.?

DR GOLD The usual preparations represent between 75 and 80 mg of mercury in 2 cc of the solution You may recall that intravenous doses of 10 to 30 mg of bichloride of mercury have been given for the treatment of syphilis, although as little as 3 mg have caused severe poisoning The usual dose of the organic mercurial given intravenously, therefore, represents a good deal of mercury, but there is the hitch that the mercury is nonionized and does not behave like the mercury of mercuric chloride. Dr Otto gave one patient in heart failure a total of 7 cc. of mercuhydrin, representing about 280 mg of mercury intravenously in fractions at hourly intervals over a period of six hours She was a very small person and in the form of bichloride of mercury, that would represent a fatal dose of mercury It produced no signs of mercury poisoning The usual dose of 1 or 2 cc. of the organic mercurial diuretic represents about one thirtieth to one fifteenth of the average fatal dose in animals calculated on the basis of body weight

Dr Modell has made some experiments on the doses of the mercurials which indicate the difference between the behavior of the two kinds of mercury

DR. MODELL It is interesting to note that by intravenous injection in cats over a period of about thirty minutes the mercurials kill by ventricular fibrillation, and the dose of mercury when given in that way is about the same whether the compound is the organic mercurial, salyrgan, or the inorganic ionizable bichloride of mercury The fatal dose for either, when given in this way, is, in terms of mercury, about 15 mg per Kg. However, it is well known that much smaller doses of mercuric chloride are fatal when allowed to act for a longer period of time, and in that case they produce death by the well known mercurial

nephritis The prolonged administration of very large doses of the mercurial diuretics also proves fatal, but while the exact mechanism of death is unknown, the indications are that the poisoning here does not involve serious renal damage

STUDENT In the dehydration process which you mentioned for patients with heart failure, do you think there is any danger of overdoing it?

DR GOLD One can overdo it, of course We don't dehydrate them to an uncomfortable degree We just get them to a point where they cease to lose weight The daily dose is so adjusted that the daily diuresis is only moderate

DR CATTELL You aim to attain a normal urinary output, do you not?

DR GOLD That is the purpose, to attain a normal output of urine

I think our time is up

Summary

DR GOLD The details of a very important development in the treatment of cardiovascular failure and other disorders leading to water retention were explored this afternoon, namely, the uses of the mercurial diuretics Experiences and practices are not entirely in accord with respect to this group of drugs There are those who confine the use of them to the frankly waterlogged patient, the one with pitting edema of the skin, ascites, pleural effusion, pulmonary rales, and large liver On the other hand, there is experience indicating a widely expanding scope of application for those drugs embracing a large variety of clinical states having a common basis in an increased accumulation of extracellular fluid Among the conditions are included very early cases of failure of the left side of the heart without the customary evidence of congestion, cases of paroxysmal disorders of rhythm, auricular fibrillation, flutter, ventricular tachycardia The beneficiaries of these drugs also include some patients with severe cardiac pain due to coronary insufficiency and some cases of hypertension The discussion probed the mechanisms involved The question was considered as to whether the mercurial diuretics have not achieved a rank at least equal to that of digitalis in cardiac therapy with respect to the quality of their benefits and the number of patients in which their application is essential to improved health There was considerable discussion of the best method of administration of the mercurial diuretics The common practice in relation to the mercurials at the present time seems to be similar to that of digitalis therapy fifty years ago, namely, that the patient receives a course during a period of advanced failure, and after recovery is allowed to continue until symptoms have reappeared There is a good deal of resistance to the idea of the maintenance dose, which is now generally accepted in connection with digitalis therapy A system for inducing the full effects with the mercurial and maintaining them by properly spaced periodic injections was outlined An analogy was drawn between the best digitalis therapy and the proposed mercurial therapy The point that there are no contraindications to the use of the mercurial diuretics with the possible exception of acute glomerulonephritis is one worth while restating, for there seems to be a good deal of unfounded fear of renal damage There were other matters which received attention in this conference, namely, the toxic effects of the mercurials, methods for dealing with them, the effects of excessive diuresis, the mechanism of the diuretic action, the factor of the mercury content in the usual doses of the organic mercurial diuretics, methods for enhancing the action of the mercurial diuretics, and their relative efficacy in cardiac and noncardiac states

---

LEARNED ADVICE

"Have you been to any other doctor before you came to see me" asked the grouchy doctor

"No, sir," replied the meek patient. "I went to a druggist."

"You went to a druggist!" exclaimed the doctor "That shows you how much sense some people have! You went to a druggist for treatment! And what idiotic advice did the druggist give you?"

"He told me to come and see you," replied the patient.—*S F and P C Druggist*

GOOD FISHING

A patient with a rod and reel sat in the grounds of a mental hospital before a very large pail of water

"Caught anything?" asked a visitor, facetiously "You're the third," was the quick response —*J Am Inst Homeop, Sept, 1945*

House of Delegates

Minutes of the Annual Meeting

[*Continued from page 2698, December 15 issue*]

Section 94 (*See 62*)

Report of Reference Committee on New Business C Governor's Commission on Medical Care

DR. S R. MONTEITH, *Rockland* On the resolution introduced by Dr Peter Murray of New York County, concerning the Governor's Commission on Medical Care, and reading

"WHEREAS, the New York State Commission on Medical Care was appointed by Governor Dewey in September, 1944 and charged by the Governor with the task of devising 'a workable plan for broadening the availability of medical services and hospitals while at the same time preserving the integrity and freedom of the medical profession', and

'WHEREAS the tentative plans developed by this Commission, as revealed recently to representatives of the Medical Society of the State of New York, contain many proposals and features which, in their judgment, are impractical or would prove detrimental to sound medical progress and would effectually destroy the integrity and freedom of the medical profession, and

"WHEREAS the medical profession yields place to no other group in its determination to improve the quality and availability of good medical care to every person in New York State, as evidenced by its energetic development of voluntary medical-care insurance plans, and

"WHEREAS, the New York State Commission on Medical Care as presently constituted, contains an inadequate number of physicians who truly represent the general practice of medicine, and

'WHEREAS, it would obviously be in the public interest if the support and participation of the medical profession might be assured in advance for any program to be offered by the Governor's Commission therefore be it

"*Resolved*, that the Governor be requested by the House of Delegates of the Medical Society of of the State of New York to reconstitute the New York State Commission on Medical Care by the appointment of additional active practitioners of medicine, and be it further

"*Resolved*, that the Medical Society of the State of New York, by action of the House of Delegates through its Council request the Governor's Commission on Medical Care to provide for a continuing conference with representatives of the Society, for the purpose of developing 'a workable plan for broadening the availability of medical services and hospitals while at the same time preserving the integrity and freedom of the medical profession "

Your Reference Committee approves this resolution without comment.

I move the adoption of this report.

The motion was seconded

SPEAKER BAUER Is there any discussion?

DR. HAROLD F R. BROWN, *Erie* In petitioning the Governor to reconstitute the Commission, I might call attention to the fact that the Governor is mandated by law to appoint so many doctors, so many nurses, so many lay people, and so many hospital administrators upon it, so unless the law is changed he cannot reconstitute the personnel on that committee. I would, therefore suggest that the resolution be modified to petition the Governor to have the law changed We in Erie County did such a thing a year ago, and the law was changed once so that two additional members were appointed The Governor can very well say, if he receives such a communication, "My hands are tied " but if we ask him to have the law changed so that he can add doctors in the active private practice of medicine, that may possibly be accomplished This resolution I don't think, will do what the delegation from New York County wishes it to accomplish I therefore, would suggest that it be amended to that effect.

SPEAKER BAUER You suggested it?

DR. BROWN No, I move it.

SPEAKER BAUER You mean you move to amend it in that respect?

DR. BROWN Yes, I do

DR. WILLIAM B RAWLS, *New York* I would like to point out that the word "reconstitute" does not mean enlarge.

SPEAKER BAUER The point that Dr Brown made was that the Governor could not do it alone, as the law specified the constitution of the committee.

DR. RAWLS He cannot enlarge it, but he can reconstitute it, he can change it. At the present time without enlarging the committee he can put on it active practicing doctors.

DR. ARTHUR J BEDELL But he would not do that at this stage

DR. HARRY ARANOW The Committee is practically finished with its study and it is ready to report. Do you think, that being so, it would be reasonable now for us to ask the Governor to reconstitute the whole committee? Let us find out first what the committee has to say, and then we can disapprove of it or ask the Governor for the reconstitution but to ask him for it now when they are almost finished seems foolish

SPEAKER BAUER Dr Williams, you wanted the floor?

DR. FREDERICK W WILLIAMS, *Bronx* I was going to ask whether the Governor could be so mandated, but Dr Brown's statement gives me the answer

SPEAKER BAUER The question is on the amendment by Dr Brown. Is there any discussion on that amendment, which is to request the Governor to take steps to have the law so revised?

DR. KIRBY DWIGHT There would be no time for the Legislature to change the law and allow the Governor to appoint a different committee, because the Legislature will not meet until some time in January I think that this request for the reconstitution of the committee will not have any effect in actually reconstituting it, but it is a very nice way, in fact a delicate way, of suggesting that we are not

satisfied with the constitution of the committee as it stands at present.

DR. THOMAS M D'ANGELO, *Queens* Since there will not be time to do the work the way we want it done by reconstituting or enlarging the committee, I would suggest that this Medical Society be prepared, through its own committees, to present our point of view adequately when this legislatively constituted committee's report is received I think in that way we can bring the practitioner's point of view to the legislature and to the entire community

SPEAKER BAUER The question is on the amendment Those in favor of the amendment say "Aye", those opposed, "No" The motion is lost You have the original motion before you, which is approval of the original resolution Is there any discussion on that?

DR. JAMES M FLYNN I would like to ask the question Did the Governor consult the Medical Society of the State of New York when he picked this committee of physicians?

SPEAKER BAUER Answering that, subject to correction, the Chair believes Dr McGoldrick was president at the time, Governor Dewey did not consult the Medical Society in picking the original committee, but in picking the two additional members he did Is that correct, Dr McGoldrick?

DR. THOMAS A MCGOLDRICK That is correct

SPEAKER BAUER Are you ready for the question?

The question was called, and the motion was put to a vote, and was carried

SPEAKER BAUER The motion is carried, and the resolution is adopted

Section 95 (*See 25*)

Report of Reference Committee on New Business C Survey of Public Attitude in New York State Toward Compulsory Medical Care Insurance

DR. S R. MONTEITH, *Rockland* On the resolution introduced by the Erie County Medical Society pertaining to the survey of public attitude in New York State toward compulsory medical-care insurance, and reading

"WHEREAS, forces and interests advocating or actively seeking establishment of a compulsory, government-operated medical-care insurance system in New York State habitually place emphasis on their claims that there is an undeniably strong movement throughout the world, nation, and state for compulsory government-controlled medical-care insurance, that the need for a compulsory health-insurance program is evidenced by various national 'polls' of public opinion conducted by certain magazines, committees, and organizations, that the public attitude toward compulsory medical care insurance must be gauged from such so-called polls, and that on the basis of such 'public demand' socialization of medicine is inevitable, and

"WHEREAS, the medical profession in the State of New York seriously questions, if not sharply challenges, the correctness and validity of the claim that these various polls accurately reflect the attitude of the people of New York State toward the medical profession and the degree to which the idea of socialized medicine has been accepted by the residents of New York State, it being the profession's belief that the people of this state, or a vast majority thereof, do not want state medical care provided by bureaucrats and politicians, but desire to purchase their medical security voluntarily under the American system of American medicine, and

"WHEREAS, an enlightened approach to this pronounced conflict of views between proponents of compulsory government-controlled medical care and defenders of America's free and progressive medical profession would seem to require that it be determined with certainty not only what the people of New York State are thinking with respect to medicine but what they want and what they do not want in the field of good medical care, the ascertainment of the true state of the collective mind being the basic object, without elements of guess or gamble, and

"WHEREAS, there exists strong reason to believe that by far the greatest number of people, when given a free choice, which they are reported to have been denied in some polls, will select as most desirable a voluntary prepayment plan as against compulsory government-operated medical service for the sick, there also being good reason to believe that many persons have been swayed into recording themselves for government-run medical care by false and delusive promises and representations by proponents of centralized control of medical service, whereas if all thinking persons would fully comprehend the threats to personal liberty concealed in these bureaucratic schemes they would take a firm stand for continuance of the American system of the best possible medical care under free enterprise, and

"WHEREAS, it is vital and important that the things that lead people to form wrong opinions be corrected studies in some states having disclosed that three out of four persons never have heard of the voluntary, nonprofit, prepayment medical-surgical service programs sponsored by the medical profession, this lack of familiarity with the physicians' own plans which offer the sound alternative to mandatory government health insurance constituting a calamitous situation, which would, however, be rectified to a marked extent by personal interviews by trained research workers, now, therefore, be it

"*Resolved*, that the Medical Society of the State of New York, represented at this duly convened meeting of its House of Delegates, appoint a Special Committee to determine upon and formulate plans for the conduct at the earliest possible date of a survey of public opinion in New York State toward the medical profession and compulsory, government-run medical-care insurance, such survey to embrace a representative cross-section of the population of the state who shall be contacted by trained investigators or research workers employed by a company of national standing, utilizing the standard scientific 'sampling' method of personal interviews and a comprehensive questionnaire form devised in collaboration with said Special Committee, and be it further

"*Resolved*, that said survey be sponsored financially by the Medical Society of the State of New York, the cost to be an expenditure from the general funds of the State Society, it being the judgment of the House of Delegates that the price paid for such a study would be an excellent investment in combating the threat of government-controlled medicine because it would

(1) Obtain an accurate reflection of the existing public attitude throughout the State, which attitude, we believe, decisively favors a voluntary prepayment plan when the people know there is a choice,

(2) Enable medicine to bring home to 'on-the-fence' persons the difference between the

medical millenium many think socialized medicine would bring them, and the sad and disappointing reality—a slump to the low and indifferent standards of medical care current to those countries saddled with state medicine,

(3) Furnish and arm the medical profession in this key state with the indisputable facts and information to be utilized by its spokesmen in establishing the fallacy and unsoundness of compulsory government-dominated health insurance as sought by any group or official body, including the New York State Commission on Medical Care, which at hearings and in other ways has plainly disclosed to medicine its desire and intention to offer a bill in the next Legislature setting up in New York State a compulsory, tax paid, health-insurance system,

(4) Spur the medical profession in this State to cooperate more wholeheartedly in the several existing voluntary medical-care programs to the end they be made so widespread in coverage and so attractive that government control and management will be clearly unnecessary to the vast majority of citizens'

Your Reference Committee opposes this resolution because it would entail a large monetary expenditure which would not be adequately justified by the results it might achieve, and because the Society is already pledged to a policy of education of physicians and public on the relative merits of voluntary over compulsory sickness insurance

We, therefore, respectfully recommend to the House that the resolution be defeated, and I so move.

The motion was seconded.

SPEAKER BAUER You have before you the report of the Reference Committee which recommends rejection of the resolution. Is there any discussion?

DR. THOMAS M D'ANGELO, *Queens* Approximately how much would it cost?

SPEAKER BAUER There is no information on that, apparently

The question was called, and the motion was put to a vote, and was carried.

Section 96 (*See 26*)

Report of Reference Committee on New Business C Opposition of State Medical Society to Establishment of Any Form of Government-Operated Compulsory Medical-Care Insurance in State of New York

DR. S R. MONTEITH, *Rockland* On the resolution introduced by Erie County Medical Society concerning opposition of the State Medical Society to establishment of any form of government-operated compulsory medical-care insurance in the State of New York, and reading

"WHEREAS, the first objective of the medical profession in the State of New York is the provision of good medical care to every person in the state under a guarantee of professional freedom to both physicians and their patients and preservation of the American system of the private practice of medicine, and

"WHEREAS, the medical profession in the State of New York intends to promote this objective, recognizing that the accomplishment of the goal of providing the highest quality of medical care is not simple but is one requiring the sincere cooperation of the medical and allied professions, labor, industry, and many other interested groups and individuals, particularly in light of the post-war revision of wage levels and living standards, and

"WHEREAS, solution of this broad problem does not and will not require government interference or control, compulsion, or burdensome taxation the physicians of New York State, through their voluntary, prepayment nonprofit medical-care insurance plans, having demonstrated their ability to develop programs pertaining to the medical economic security of this State, the same programs being founded on the principle that the care of the public health and the provision of medical service to the sick is primarily a local responsibility, and

"WHEREAS, medicine acclaims the growth of voluntary medical-care insurance plans in this State under the stimulus of the Central Bureau of Medical Care Insurance created by the Medical Society of the State of New York, to coordinate existing prepaid voluntary medical-care insurance plans, effect formation of new plans in unserved territory, and educate the public, notably those in the lower income brackets, as to the many advantages and availability at a minimum cost of voluntary medical-service insurance, in evolving these plans the medical profession of this state being prompted by a feeling of social responsibility in the vital field of medical care, and

"WHEREAS the fourteen-point program for the extension of improved health and medical care to all the people of the nation, as presented by the physicians of the United States through the American Medical Association, contains the fundamental principles upon which a sound, progressive plan for providing good medical care in any state may be established, with proper emphasis on the problem of caring for the indigent sick and those having chronic illness for which there are no suitable provisions under existing or proposed compulsory sickness-insurance plans in the Legislature of the State of New York, and

"WHEREAS the medical profession in this state recognizes that the establishment of hospitals, laboratories, and other medical facilities in areas not having adequate provision to meet medical needs meets with general approval, as do grants of government aid to sections where need is demonstrated, but points out that the needs of these inadequately supplied areas cannot properly be used as a reason for subjecting to state regulation the major portion of the state having far more advanced standards and facilities, the areas of higher standards being able to progress better under their own planning than they would under any governmental pattern, and

"WHEREAS, medicine in this state submits that voluntary methods of insurance, utilization of existing facilities as far as possible expansion of existing public health services, aid to the indigent and impoverished communities, preservation of private practice, and the principle of local determination of need and local control of administration are basic principles of Americanism, and these principles, which are the expression of a public-spirited profession devoted to human welfare, should not be ignored or circumvented, and

"WHEREAS though understanding of these principles by the public and our legislators should pave the way for enthusiastic cooperation of the medical profession and other responsible groups in providing the best of medical care to all residents of this state, it has become necessary to protect the public by opposing the substitution of a system of medicine with the regimentation of patients

and physicians in New York State, such as would destroy the American qualities of medical service that are most important to health, and

"WHEREAS, study of government-run compulsory insurance plans in other countries has revealed marked tendencies to loss of the importance of the individuality of the patient and to deterioration of the quality of the service, political manipulation and exploitation for political patronage purposes as well as diversion of insurance funds to various purposes, the entire pattern of such government-dominated systems being contrary to the intrinsic American principle of personal initiative and individual effort, and

"WHEREAS, there now is before the Legislature of the State of New York the Ives Compulsory Health Insurance Bill for New York State, and medicine is threatened with the introduction at the 1946 Legislative Session of other measures proposing compulsory government-operated medical-care insurance—measures which would create a state-wide network of local administrative bureaus financed by additional millions taken from the pockets of already harassed taxpayers, measures which would break down the old-fashioned physician relationship and lower, not raise, the standards of medical practice, now, therefore, be it

"*Resolved*, that the Medical Society of the State of New York, represented at this duly convened meeting of its House of Delegates, is keenly aware of the ultimate consequences of imposing on the people of New York State a government-controlled, compulsory medical-care insurance system and is deeply concerned over existing and impending legislation to put just such a system into operation in this State, but at the same time is prepared to meet the issue of state medicine vs free medical practice, and be it further

"*Resolved*, that the Medical Society of the State of New York hereby places itself on record as condemning all attempts to establish in the State of New York any form of compulsory, government-controlled medical-care insurance, and pledges itself, its members, and its resources to vigorous and uncompromising opposition to any and all bills or other proposals introduced in the New York State Legislature, or made the subject of hearings or conferences, which have for their purpose the placement of the health and medical service of this State under a state bureaucracy, the medical profession believing it can be entrusted to accomplish all that any state medicine plan could accomplish, and to do it without regimentation of the people and the profession."

While approving each sentiment expressed in this document, your Reference Committee deplores its verbosity

To carry out the thoughts contained therein, we urge each delegate present to become militant in his county society, attempting to awaken in each component group the necessity of immediate coordinated action to acquaint the people of the State of New York with the dangers imminent to their freedom of thought and action, using every means at his command to emphasize the principles on which good medical care should be based We commend our officers, past and present, for the unstinted efforts expended by them for organized medicine, and urge that publicity be sought for our cause in order that the accusation so often leveled at our organization, that its attitude is negative only, can be successfully controverted

We do have a goal—adequate medical care for all

This is our platform, and with the education of the public we believe it can be reached by local action untrammeled by governmental interference or the interpolation of the services of reformers

I move you, sir, the adoption of the report

SPEAKER BAUER Which I understand carries with it the rejection of the resolution?

DR. MONTEITH No, sir, we approve it

SPEAKER BAUER Oh, you just object to its length?

DR. MONTEITH Yes

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 97. (See 74)

Report of Reference Committee on New Business C Voluntary Medical Insurance (Establishing a National Casualty Indemnity Company)

DR. S R MONTEITH, *Rockland* This resolution was introduced by Dr Wertz, of Erie County

"WHEREAS, the development and promotion of voluntary medical insurance can be advanced by the organization of a casualty company for the purpose of coverage in areas of New York and other parts of the United States where no plans now exist, and

"WHEREAS, such a casualty company is necessary as an agency to relate the enrollment of nation-wide employers to the various local non-profit medical plans, and

"WHEREAS, such a casualty company can be organized wholly within the control of the medical profession, therefore be it

"*Resolved*, that the Medical Society of the State of New York, represented at this duly convened meeting of its House of Delegates, instruct that the Council create a special committee of three members charged with the task to investigate the feasibility of developing and putting into operation a national casualty indemnity corporation chartered under the laws of the State of New York to enter into contracts with establishments in this State for a Surgical Indemnity Insurance Plan, and that this Committee report its recommendations to the Council not later than January 31, 1946

"It is recommended to the Council that the Committee be instructed to provide, if the Council approves, that all such contracts entered into by the proposed corporation take into consideration and utilize all existing local medical- and surgical-care insurance plans with supplemental coverage to be contracted for only in cases where local plans are not available, and be it further

"*Resolved*, that the special committee of three be empowered to take all necessary action, subject, however, to the approval of the Council of the Medical Society of the State of New York, and that the Council, if it approves, request that the Board of Trustees invest such funds for the setting up of the proposed corporation as in their opinion is required or desirable"

Your Reference Committee desires to report that it is in hearty agreement with this resolution, and recommends its approval, and I so move

The motion was seconded

DR. JACOB WERNE, *Queens* I would like to amend the approval of the formation of the casualty company to read "for medical care" and not just for

surgical care. Surgical care is just one small item of medical care.

DR. THOMAS M D'ANGELO, *Queens* Dr Werne's point is well taken, but this casualty company at present only wishes to provide for surgical care It is intended practically only to be for catastrophic illnesses.

May I give a few words of the background of this motion It seems that the Blue Cross Plans are running into tremendous difficulty right now, and losing a tremendous amount of business, because national corporations which are at present insured for hospitalization by the local Blue Cross Plans and also by the local voluntary medical insurance corporations in the community, wish to insure their entire personnel throughout the United States. In so doing, they have found that there are places where there are no medical-care-plan services available but there are Blue-Cross-plan services available so in many cases they have gone to the commercial companies who will give them full national coverage. They are primarily interested only in catastrophic surgical illnesses at present, and I think we can very well go along and provide such a national casualty company to provide for these services at present under a surgical indemnity plan, and if later on we can enlarge these services to include medical-care services, the corporation then can very well be enlarged to that extent.

DR. JOSEPH A. GEIS, *Essex* It seems to me that here you are asking for the appointment of a committee of three to do a tremendous amount of work and to make a report on the first of next January, roughly two months from now I don't believe you are giving that committee a chance, especially if those men have to practice medicine for a living in between times Therefore I would suggest that that date be made at the next House of Delegates for them to make their report rather than in a couple of months You are not giving the men enough chance to do the work, so I make a motion that that be amended to read to report at the next meeting of the House of Delegates instead of in January to the Council.

SPEAKER BAUER We have one amendment. I will take yours up later

DR. DWIGHT I think the point that Dr Geis has made is a good one, but time is of the essence here. I understand that the Blue Cross plans throughout the country are not going to wait much longer, and if the medical men are not willing to take control and evince their willingness by some substantial contribution they are going ahead and form such a national casualty company without medical control.

DR. D'ANGELO Dr Geis' point is well taken, and certainly it would be almost impossible in a matter of two months or so to do this work, but I can state definitely that the groundwork has already been done. It is only the matter of setting up a corporation to carry on the work.

DR. WERNE I think it is extremely important to substitute "medical" for "surgical," for this reason The opposition of many lay and welfare groups to plans for sickness insurance has been mainly founded or focused upon that one point, that we seem to specify easily definable conditions to insure against, like an appendectomy or a nephroureterectomy, and omit other considerations which are just as important. There are medical catastrophes as well as surgical catastrophes and if this committee feels that because of lack of insurance statistics they must limit the coverage to special surgical cases and leave others to focus on general medical care, I think that is a very unwise step and that it would be better to term this for medical care.

SPEAKER BAUER Dr Werne's amendment is to substitute the word "medical" for "surgical." Is his amendment seconded?

DR. D'ANGELO Can we put in "medical and surgical?"

DR. WERNE I will accept that.

DR. D ANGELO Then I will second the amendment.

DR. JAMES F ROONEY I think that the text of this resolution refers this matter to a council-appointed committee to study the desirability and feasibility of such a scheme.

CHORUS Right!

DR. ROONEY I think that there was plenty of time for that committee to have been appointed and to have made its report before the Council of the Medical Society of the State of New York without any extreme amount of effort being expended in the study of the plan which has already been made by men who are now prepared to furnish us with facts and with data upon which such a committee could form its opinion. I think, as Dr Dwight has just said, that time is of the essence. There is no question about the fact that commercial companies are perfectly ready, and the Blue Cross is perfectly ready to take over this matter without any referment to the medical profession as a whole, and with very little representation.

While I have no objection to the amendment including medical care, in the long run it will not make much difference because that amendment as well as the original resolution will be referred, if it prevails, to this council committee. I think you can leave that in the hands of your Council committee, gentlemen It is to be a small committee, with time enough to discuss the matter in all of its aspects, rather than to attempt to fix here within definite small limitations the powers of this committee. The House has no reason not to be able to trust a committee of the Council, I think we all realize that, therefore, I should have no objection to the amendment to include medical care. It will all come before this committee, and I do not feel that it requires more time than that already specified. If we take more time, we are likely to finish up like the ass between the two bundles of straw, and lose the decision and starve to death

SPEAKER BAUER The question is on the amendment to substitute medical and surgical care for surgical care. Is there any further discussion?

The question was called and the amendment was put to a vote, and was carried

SPEAKER BAUER Now on Dr Geis' amendment to extend the time from January—

DR. GEIS Due to the fact that other members of this House claim that the groundwork has already been done I withdraw that amendment.

SPEAKER BAUER The amendment is withdrawn You now have before you the amended motion, which substitutes "medical and surgical" for the word 'surgical,' and otherwise the resolution is recommended for approval by the Reference Committee

Is there any further discussion on that?

The question was called, and the motion, as amended, was put to a vote, and was carried.

SPEAKER BAUER I hope you all had a good breakfast this morning, gentlemen, because it is past 12 00 NOON, and I think your chances of getting lunch are extremely slim. However, we will have a seventh inning stretch of three minutes.

There was a three-minute recess at this point

SPEAKER BAUER The House will be in order The Chair recognizes Dr Moore, Chairman of the Reference Committee on New Business B

Section 98 (See 35)

Report of Reference Committee on New Business B Discontinuance of the Drafting of Professional Students

DR NORMAN S MOORE, *Tompkins* Reporting on the resolution introduced by Erie County on the discontinuance of the drafting of professional students, reading

"WHEREAS, the inadequacy of our national medical resources, which became acutely evident during World War II, threatens to become a chronic situation unless prompt and effective steps are taken to solve the problem, keeping in mind that the war has multiplied the medical responsibilities of the nation, and

"WHEREAS, the supply of physicians is not great enough numerically, in the judgment of competent observers, to provide for a high standard of medical care for both civilian and government requirements, and

"WHEREAS, one of the reasons for this condition was the unfortunate policy of Selective Service in refusing to defer prospective medical students which is bound to result for many years to come in a decrease in the usual annual increment of physicians, military policies also having curtailed the training of specialists during the war, and

"WHEREAS, there is little doubt in any physician's mind that the present federal policies will bring about a critical condition in meeting civilian and other medical needs in the years to come, and

"WHEREAS, the Council on Medical Education and Hospitals of the American Medical Association has repeatedly urged the necessity for changes in the policies of governmental agencies, notably the Selective Service System, having to do with the education of premedical students, and the House of Delegates of the American Medical Association took official cognizance of the seriousness of this problem, and

"WHEREAS, the medical profession is being depleted by about four thousand deaths and an unknown number of retirements annually, which, placed alongside the constant withdrawal by Selective Service of premedical students from their studies, will add up to a very serious situation, if not the greatest deficit of medical men in history, unless a continuous flow of medical student graduations is maintained annually, and

"WHEREAS, similar alarm is registered by the professions of dentistry, law, pharmacy, engineering, nursing, and other highly skilled pursuits, likewise those concerned with the various sciences, now, therefore, be it

"*Resolved*, that the Medical Society of the State of New York, represented at this duly convened meeting of its House of Delegates, goes on record as strongly favoring the immediate discontinuance of the drafting of all persons engaged in studies preparatory to practice of any of the recognized professions or engagement in any scientific occupations, and that the War and Navy Departments and the Selective Service System be and they hereby are urged and petitioned to remove this menace to professional education and professional standards by ceasing the drafting of all such students"

Your Reference Committee feels that the wording of the resolution is so broad and exempts so many students, that it would be unacceptable to the authorities of the Army, Navy, and Selective Service. Therefore, the Reference Committee recommends the following substitute resolution

"*Resolved*, that the Medical Society of the State of New York represented at this duly convened meeting of its House of Delegates goes on record as strongly favoring the exemption from draft for service in the armed forces all those persons engaged in studies preparatory for the study of medicine, who have academic records of sufficient standing to indicate serious intent in their studies, and whose admission to medical school is reasonably assured, and be it further

"*Resolved*, that a copy of this resolution be forwarded to the Secretary of the Association of American Medical Colleges and to the Committee on Medical Education of the American Medical Association"

I move the adoption of the substitute resolution.

The motion was seconded

SPEAKER BAUER You have before you the adoption of the Reference Committee's recommendation, which has amended the resolution to make it more specific Is there any discussion?

DR JAMES F ROONEY I am not so sure that this is a wise plan I think, without any question, that there is, and has been even in the past, a very serious, shall one say, attempt to evade the law by men entering upon so-called premedical training Whether under the present state of affairs it is a wise thing to pass a resolution of this sort, I seriously question It would not be well accepted, and it might entail undue and unnecessary publicity, which we are having enough of I think it might be much better, and I shall move to amend, that this resolution of the House of Delegates be referred to the Council for their consideration and further action, if in their opinion it is desirable

SPEAKER BAUER Dr Rooney's motion is to commit this resolution to the Council, rather than the amendment, for their consideration and action

DR. ROONEY That is right

The motion was seconded, and as there was no discussion, the motion to commit was put to a vote, and was carried

Section 99 (See 47–89)

Report of Reference Committee on New Business B Resolution of Surplus Medical and Dental Equipment

DR. NORMAN S MOORE, *Tompkins* On the resolution presented by Dr Samuel Z Freedman, of New York, concerning surplus medical and dental equipment, reading

"WHEREAS, after the last war surplus army and navy dental and medical equipment was sold to dealers who in many cases made exorbitant profit by resale to physicians and dentists, many of whom were veterans, and

"WHEREAS, some method should be found whereby surplus medical material and equipment of World War II may be made available to physicians and dentists at reasonable prices, therefore be it

"*Resolved*, that the Medical Society of the State of New York request the proper governmental authorities to devise a procedure whereby such material may be purchased directly from the government or that a ceiling price be set for resale

through dealers so that veterans and other physicians may be enabled to purchase needed equipment at the lowest possible prices, and be it further

"*Resolved*, that the Board of Trustees of the American Medical Association be urged to use its influence in working out a plan for this purpose

Your Reference Committee is in sympathy with this resolution but believes attention should be called to the fact that the purchaser of Army salvage material has no redress in case the material is defective when purchased direct from the Government. Dealers on the other hand usually substantially guarantee their products, and frequently the purchaser is better off under such conditions even though he has paid a substantial markup. With these words of caution the Reference Committee recommends the adoption of this resolution, and I so move.

The motion was seconded

DR. SAMUEL Z FREEDMAN, *New York* In reference to that telegram that was received, I think this would be the place to include that. I am told by our public relations counsel that the surplus-property officials have requested that there be a request made by us for priority to be given to medically discharged veterans in the purchase of automobiles. That would cover that telegram that was sent to us so I would move an amendment to that resolution accordingly

SPEAKER BAUER It has been moved to amend the committee's report by adding to that that veterans be given preference in the purchase of surplus cars, which disposes of the telegram we received this morning from a man in the service

The amendment was seconded and both the amendment and the motion as amended were put to a vote and were unanimously carried

Section 100 (*See 84*)

Report of Reference Committee on New Business B Transfer of Health Services from Children's Bureau to U S Public Health Service

DR. NORMAN S MOORE *Tompkins* On the resolution presented by Dr Mitchell on behalf of the Council, reading

"WHEREAS, the U.S Public Health Service is the official agency of the Federal Government primarily responsible for the prevention of disease and the protection of the public health, and

"WHEREAS, the U.S Public Health Service carries on these activities through the State Departments of Health and other State agencies in the field of public health, and

"WHEREAS, the health services for mothers and children now conducted by the Children's Bureau of the Department of Labor parallel and in many instances overlap the responsibilities of the Public Health Service and require duplication of district facilities and personnel and a confusing duplication of federal relationship with state health departments and other State agencies in the field of public health, and

"WHEREAS, it would be more logical, effective, and more economical to have all public health responsibilities concentrated in one federal agency and establish one direct channel of relationship with state health departments therefore be it

"*Resolved* that the House of Delegates of the Medical Society of the State of New York hereby memorializes the House of Delegates of the American Medical Association to petition the Congress and the President of the United States to transfer the personnel facilities, and budget of the Children's Bureau from the Department of Labor to the U.S Public Health Service"

Your Reference Committee recommends the adoption of this resolution, and I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 101 (*See 85*)

Report of Reference Committee on New Business B Veterans' Hospitals

DR. NORMAN S MOORE *Tompkins* Resolution introduced by Dr J Lewis Amster, of the Bronx reading

"WHEREAS our attention has been called to the need of additional hospitals for the care of veterans who have served in World War I and World War II, and

"WHEREAS, this need is becoming more and more emphasized with the rapid homecoming of our sick and disabled men in the armed forces and

"WHEREAS, some of the Veterans' Hospitals situated in and around the City of New York are now taxed to capacity, be it

"*Resolved* that the Medical Society of the State of New York approves the immediate erection of additional hospitals for the care of sick and disabled veterans in this vicinity"

Your Reference Committee recognizes the crowded conditions of veterans' hospitals in and around New York City and even though it is aware that plans are under way for the correction of this the committee recommends the adoption of this resolution and I so move.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Section 102 (*See 85*)

Report of Reference Committee on New Business B Combatment of the Growing Antivivisection Menace

DR. NORMAN S. MOORE, *Tompkins* On the resolution introduced by Erie County Medical Society on the combatment of the growing antivivisection menace and reading

"WHEREAS, the Medical Society of the State of New York is deeply conscious of the rapidly spreading antivivisection menace as evidenced by the introduction in the Congress and numerous State Legislatures of bills to prohibit the use of live dogs in the scientific animal experimentation, the arrest of high officials of Northwestern University at the instigation of publicity-seeking Chicago antivivisectionists the appearance in certain national periodicals of sensationally phrased, inflammatory and outrageously untrue articles against animal research, the current campaign by antivivisection groups to enlist new members in their movement to outlaw by destructive legislative enactments future animal research in our biologic and pathologic laboratories, our medical schools and scientific institutions, as well as by other activities reflecting fanaticism, undue emotionalism, false sentimentality, and utter irresponsibility, and

"WHEREAS, the 1945 session of the New York State Legislature was witness to the introduction of two bills to prohibit scientific experimentation by the use of live dogs, one of which measures swept through the State Senate with only nine opposing votes, thus becoming the first bill of its kind ever passed by either branch of the New York State Legislature, this same piece of legislation finally being defeated in the State Assembly after the bitterest of contests between forces of enlightened medical progress and forces of scientific ignorance and misrepresentation, ,and

"WHEREAS, defeat of the bill in question must be attributed in the main to the courage and clear thinking of our State Assembly leadership and members, who recognized that the great benefactions of medicine and surgery granted humanity far outweighed the necessary sacrifice of some lower animals, and

"WHEREAS, those legislators who opposed and brought about the death in Assembly Rules Committee of this pernicious measure, with emphasis on the names of the Hon. Oswald D Heck, Speaker of the Assembly and Rules Committee Chairman, and the members of Rules Committee, are to be warmly commended and congratulated for their cooperation with medical science in standing firmly against those who sought to throttle medical research dedicated to the promotion of human health, the alleviation of misery, and the prolongation of human life, and the medical profession of the State of New York hereby acknowledges its debt of gratitude for such splendid assistance, and

"WHEREAS, the self-same antivivisection elements, heartened by their near victory at the last session of the State Legislature, now are preparing, according to well-informed sources, to introduce and press for passage in the coming 1946 session of the New York State Legislature a bill similar to that which almost received the approval of the 1945 Legislature, and

"WHEREAS, the voice of medicine and science, so far as it receives authoritative utterance, is overwhelmingly opposed to legislation, federal, state, or local, which purposes in any way to outlaw, restrict, or interfere with animal experimentation and research, which offer the prospect of even greater scientific gains in the future, and

"WHEREAS, the medical profession believes that a truly intelligent consideration of the facts about animal experimentation can bring but one conclusion—that medical science will perish if animal research is eliminated or curbed, and that to achieve that intelligent consideration by the public is the task confronting medicine and science in this State, and

"WHEREAS, the Medical Society of the State of New York has noted with high interest and approbation the recent action of the Medical Society of the County of Erie in setting up a Committee for the Defense of Medical Research, composed of twelve Erie County leaders in the fields of medical practice, education, research, and science, which committee is dedicated to this triad of objects

(1) A progressive program of education to adequately inform the public as to the truth and facts with respect to scientific animal experimentation by the use of the lower animals, which at no time is cruel, and the great benefits of animal experimentation to mankind,

(2) Development of public and legislative opposition to enactments which would hamper or destroy medicine's ceaseless struggle to conquer disease,

(3) Combatment on the floor of the New York State Legislature, in cooperation with Erie County and Western New York lawmakers, of any measure that would control, limit, or prohibit the free course of beneficent scientific inquiry, and

"WHEREAS, the expanded activities of the anti vivisection bloc in many states and the national capital have impelled the Committee for the Promotion and Protection of Animal Experimentation in Biological, Medical, and Dental Research and Teaching, of the Association of American Medical Colleges, to undertake the establishment of a Bureau of Public Relations for the planned education of the American public relative to the value of medical and biologic research, inclusive of animal experimentation, such Bureau to be financed by member institutions and prominent medical institutes, which developments on a nation-wide footing emphasize the need for action on the part of state medical groups to offset the vicious efforts of the antivivisection elements, and

"WHEREAS, the Medical Society of the State of New York, being gravely concerned over the anti medical crusade being waged by misguided forces in this State and thoroughly aroused over their efforts to deal a devastating blow to medical research and public welfare, is agreed that medicine must prepare at once to meet renewal of the antivivisectionists' drive at the 1946 legislative session, now, therefore, be it

"*Resolved*, that the Medical Society of the State of New York, represented in this duly convened meeting of its House of Delegates, appoint with all convenient speed a special committee to determine and formulate, on a state-wide basis, an effective educational and defensive program to combat the growing antivivisection threat, such program to include a strong recommendation to every county medical society in the State that it establish without delay a local committee for the Defense of Medical Research patterned after the Erie County Medical Society's committee, thus providing a united medical front for the promotion and encouragement of scientific achievement and the defeat of legislative proposals to hamper or cripple medicine's efforts to advance the cause of public health"

The Reference Committee recommends a substitute resolution which deletes the last line of the resolution, namely, "defeat of legislative proposals to hamper or cripple medicine's efforts to advance the cause of public health," and substitutes for that line "dissemination of truthful information to the public regarding animal experimentation and its beneficent effect on humanity"

I move the adoption of the substitute resolution as recommended by the Reference Committee.

The motion was seconded

SPEAKER BAUER The Reference Committee's report approves the resolution, with the exception of one sentence which is amended Is there any discussion on that motion to adopt?

DR. JAMES F ROONEY I rise to a question of information from the Chairman of the Reference Committee As I heard him read that amended resolution, the House of Delegates was to appoint a committee

Is that correct? Is that embodied in your resolution?

DR. MOORE No, each county society is to appoint a committee

DR. ROONEY What directive agency of the State Society would have supervision over that?

DR. MOORE Just a minute you are right, it is the House of Delegates. It reads

"*Resolved*, that the Medical Society of the State of New York, represented in this duly convened meeting of its House of Delegates, appoint with all convenient speed a special committee to determine and formulate, on a state-wide basis' etc.

DR. ROONEY I would, therefore, move to amend that, so that approval be given by this House of this resolution and the matter be referred to the Council for action.

SPEAKER BAUER Dr Rooney moves an amendment of the resolution to the effect that approval be given to the resolution, as recommended by the Reference Committee, but that it be referred to the Council for action rather than have the House of Delegates appoint the committee

The motion was seconded, and as there was no discussion, both the amendment and the motion, as amended, were put to a vote and were unanimously carried.

Section 103 (*See 53*)

Report of Reference Committee on New Business B Requesting a Session on Chest Diseases at the Next Annual Meeting

DR. NORMAN S. MOORE, *Tompkins* On the resolution presented by Dr Nelson W Strohm, of Erie County requesting a session on chest diseases at the next annual meeting, and reading

"WHEREAS, at the 1941 meeting of the House of Delegates a resolution by the House of Delegates recommending a symposium on chest diseases was approved, and

"WHEREAS, such a symposium was given on chest diseases at a general session of the annual convention in 1942, and

"WHEREAS, this general session was enthusiastically attended and appreciated indicating the definite interest of the medical profession in the subjects presented, and

"WHEREAS a certain chest disease namely tuberculosis, has almost become the forgotten disease, and

"WHEREAS, this disease which is the most common of all chronic chest diseases is very amenable to care and treatment, therefore be it

"*Resolved*, that the House of Delegates of the Medical Society of the State of New York established a session on chest diseases for the next annual meeting."

The Reference Committee recommends the adoption of this resolution, and I so move.

DR. JAMES F ROONEY I have a definite recollection that the question of the appointment of all additional sections of the scientific body of the Society must of necessity be acted upon by the Council and have its approval.

SPEAKER BAUER This is a s-e-s-s-i-o-n not a s-e-c-t-i-o-n

DR. ROONEY Oh, they are not asking for a new section then?

DR. MOORE No it is a session

The motion was seconded, and as there was no discussion it was put to a vote, and was unanimously carried.

Section 104 (*See 88*)

Report of Reference Committee on New Business B: Early Release of Doctors from Armed Services

DR. NORMAN S MOORE *Tompkins* Resolution presented by the Medical Society of Erie County on early release of doctors from armed services, and reading as follows

"WHEREAS the medical profession of the United States as a body, as well as all of the citizens of our country, have just reason to be proud of the achievements of the medical corps of all branches of the armed forces in World War II, their skilled services having greatly reduced battle fatalities and enhanced military morale, contributing materially to the ultimate victory which was the portion of the Allied Nations and writing another shining chapter in the history of American medicine, and

"WHEREAS, the upwards of sixty thousand American physicians who responded to the call of their country in the greatest struggle in which our nation ever has been engaged nobly left their homes and occupations, in many cases at a large personal sacrifice which never can be adequately compensated by a grateful people, to serve bravely and well in far flung war areas, and

"WHEREAS, the end of World War II has brought a swelling demand from medical organizations industry, labor, members of Congress, the press from doctors themselves in uniform, and above all from the civilian public to whom medicine owes its heaviest responsibility, for the speedy release of the greatest number possible of physicians in the Armed Services, in the national interest, and

"WHEREAS, the medical profession feels that it has discharged its obligation in the emergency the armed forces were required to face and seeks the same sympathetic consideration for its colleagues in uniform as will be accorded other servicemen in Army Navy, Marines, and Coast Guard, to wit, that the reduction of the number of medical officers in the service be in the same proportion as that of line personnel and

"WHEREAS, while the medical profession is fully aware that during the next few months problems of care, evacuation, and disposition of the wounded and sick still coming from overseas as well as the task of general demobilization will require the continued services of doctors, for the performance of which vital functions medicine definitely favors the provision of a sufficient number of trained physicians it nevertheless is deeply concerned over the possibility of arbitrary retention in the armed forces of a huge surplus of doctors unnecessary to military demands and detrimental to civilian population welfare, and

"WHEREAS more and more medical officers, in letters received by state and county societies from individuals and groups, reflect concern over the feeling that the several medical corps have large numbers of doctors who could be released at once to return to civilian practice, particularly in communities where need for returning medical officers is acute and in which thousands anxiously await the homecoming of their own family doctor and

"WHEREAS, the medical profession has read the statement that physicians will be discharged from military service on a point system similar to that covering the servicemen whom they have treated and likewise has noted with interest the more recent announcement that some thirteen

thousand physicians of the Army Medical Department only will be returned to civilian life by the end of 1945, but it believes and holds that the system of release should be at once revised and liberalized to embrace all branches of the Armed Service, and

"WHEREAS, the Medical Society of the State of New York, like the American Medical Association, well realizes it has the power merely to recommend the elimination of further delays in freeing to civilian practice the reputed surplus of doctors in military service, but hastens to point out that failure to facilitate in every possible way the discharge of medical officers would constitute a grave injustice to the public and unfair treatment of both the service doctor who has placed devotion to country above all personal considerations and the homefront physician who has been taxing his strength, now, therefore, be it

"*Resolved*, that the Medical Society of the State of New York, represented at this duly convened meeting of its House of Delegates, hereby earnestly urges and petitions the government of the United States, through its proper and appropriate Federal departments and officers, to bring about the effective accomplishment of the foregoing objects, namely, the honorable discharge and return of all medical officers to private practice as soon as military necessity will permit"

Your Reference Committee recommends the adoption of this resolution, and I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 105 (*See 36*)

Report of Reference Committee on New Business B Remission of State Society Dues to Discharged Medical Officers

DR. NORMAN S MOORE, *Tompkins* We have two resolutions dealing with this subject The first is from the Medical Society of the County of Erie and reads

"WHEREAS, thousands of members of the Medical Society of the State of New York left their homes and practices to serve with the armed forces all over the globe in World War II which recently ended, and

"WHEREAS, many of these medical officers have been discharged from military service and many others now are returning, or will sometime return, to New York State to re-establish themselves, and

"WHEREAS, it is recognized that a large proportion of these returned medical officers will face financial and economic problems in connection with their readjustment to civilian life, and

"WHEREAS, the Council of the Medical Society of the State of New York more than a year ago adopted the following procedure with respect to remission of dues of members discharged from the armed services

'A member discharged from the armed forces, after more than sixty days of service, shall have his dues remitted for the calendar year in which he was discharged, regardless of the month, however, unless he has served a total of at least fourteen months he shall not be entitled to remission of more than one year's dues,'

and

"WHEREAS, a considerable number of members of the Medical Society of the State of New York feel that the present policy and protedure could well be liberalized to accord to the returned medical officer an even greater measure of financial cooperation and a fuller expression of good will, now, therefore, be it

"*Resolved*, that the Medical Society of the State of New York, represented at this duly convened meeting of its House of Delegates, hereby goes on record as favoring and proposing that the existing procedure be revised and liberalized to provide for remission by the State Society of its portion of dues for a *full twelve-months' period* to every member-medical officer after and from the date of his retirement or discharge from the armed services, and that all county societies be requested to pursue the same method"

Your Reference Committee believes that in order to ease the administration difficulties of the county societies an additional fraction of a year should be waived to coincide with the fiscal year of each society and, therefore, the committee recommends the following substitute resolution

"*Resolved*, that the Medical Society of the State of New York, represented at this duly convened meeting of its House of Delegates, hereby goes on record as favoring and proposing that the existing procedure be revised and liberalized to provide for remission by the State Society of its portion of dues for a *full twelve-months' period plus any additional months necessary to coincide with the fiscal year of the Society*, to every member medical officer, after and from the date of his retirement or discharge from the armed services, and that all county societies be requested to pursue the same method"

I move the adoption of the substitute resolution approved by the Reference Committee

SPEAKER BAUER It has been moved that the report of the Reference Committee, which substitutes a resolution for the original one, be adopted

The motion was seconded

DR JAMES F ROONEY Although I should not be speaking on this matter perhaps, being in what might be considered a favored category, I think this is an unwise plan Everything should be done for the returning medical officer, but I feel that a substitute to this resolution or this recommendation of the Committee could well be made that would not impair the already markedly affected dues income of the State Society We are already remitting the dues of approximately four thousand, five hundred medical officers in the services, which means a diminution in the income of the Society of $45,000 a year

I feel that it might be well to recommend to the various county societies, perhaps with some exception of the smaller societies from whom very few of these medical officers will come, that the county society pay for the period outlined in the recommendation of the committee the State dues of the member returned from service for this period and remit the county society dues

The State Society will have to meet, in the coming years, in the next three years, probably, a very great annual budget, greater than even it has been called upon to meet in the past four years A very large number of plans are being presented, with many new committees, which will entail the expenditure of additional money

As a matter of discussion, I would, therefore, move to amend this recommendation to the effect—and I will not be able to quote from memory the period prescribed in the recommendation—but for this period prescribed in the recommendation the county society remit the county society dues of

these members who have returned from service, and at the same time undertake upon themselves the obligation to remit from their own funds the annual State dues of these members

SPEAKER BAUER Is the amendment seconded?

There was no response

DR. ROONEY I don t think there is a chance for it to pass but maybe you will think about it.

SPEAKER BAUER The amendment has not been seconded, so we come back to the original report of the Reference Committee.

DR. EZRA A. WOLFF *Queens* Does this call for the remission of dues for the fiscal year in which the man returns plus a year?

DR. MOORE No a full twelve months from the time of his discharge plus any fraction that would bring it up to the fiscal year of the Society

DR. WOLFF Which amounts to the same thing?

DR. ROONEY That is what it amounts to It would amount to an average remission of eighteen months dues.

The question was called, and the motion was put to a vote and was carried

Section 106 (*See 50-105*)

Report of Reference Committee on New Business B Remission of Dues (County of Monroe)

DR. NORMAN S MOORE, *Tompkins* This is also on the remission of dues and was introduced by Dr Leo F Simpson of Rochester

"WHEREAS, many of our colleagues, members of the Medical Society of the County of Monroe have given their services to their government during the present World War, and

"WHEREAS, this separation from civilian life has resulted in a change from a civil to a regimented military life, and

"WHEREAS many of our members now serving in the Armed Forces will have difficulty in resuming civil practice and many will wish to enter upon postgraduate work for varying periods, therefore be it

"*Resolved*, that the Medical Society of the County of Monroe remit the dues of all of those members returning from the armed forces for a period of months or years equivalent to that served in the armed forces and further be it

"*Resolved* that the Medical Society of the County of Monroe petition the Medical Society of the State of New York to remit the state assessment for these members for a similar period'

Your Reference Committee believes that a general policy in regard to the waiver of dues would be more efficient to administer and in the end would contribute justice equally to all members of the Society recently discharged from military service. Inasmuch as a resolution has been recommended defining a minimum limit of one year, the Committee disapproves this resolution.

I move the adoption of the Reference Committee s report.

The motion was seconded and as there was no discussion, it was put to a vote and was unanimously carried

Section 107 (*See 69*)

Report of Reference Committee on New Business B Report of Special Committee to Study the Question of Medical Practice in the State of New York

DR. NORMAN S MOORE, *Tompkins* The following is on the report of the subcommittee of the Special Committee to Study the Question of Medical Practice in the State of New York which was held in the State Society's offices at 292 Madison Avenue, New York on Tuesday, September 11, 1945 Portions of this report were read to the House yesterday by Dr Bauer, and I am going to read the questions the subcommittee's opinion, and the Reference Committee's opinion per section

"Question I—Should there be a thorough revision of the entire Medical Practice Act?"

The subcommittee in its deliberations on September 13, 1945, recommended that there should be no thorough revision of the entire Medical Practice Act, and your Reference Committee adopts the recommendation of the subcommittee on that point. I, therefore, move the adoption of that portion of this report.

SPEAKER BAUER This portion of the report recommends that there be at this time no general revision of the Medical Practice Act Is there any discussion on that recommendation?

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. MOORE Continuing

"Question II—Should amendments to the present statutes pertaining to the practice of medicine be proposed?"

The committee deliberated on this question, and has proposed several possible amendments These were read yesterday

The Reference Committee believes that these amendments should be made following the subcommittee's recommendations and, therefore, support the subcommittee's recommendation, and I so move

SPEAKER BAUER I think the House will have to know what those recommendations are before they can act intelligently on them

DR. MOORE The following suggested changes were considered

(*a*) Changing of title of the Medical Practice Act. It was recommended that the Title of Art. 48 of the Education Law, be changed to include the word 'Healing.' The present title is Practice of Medicine.' It is thought that the laity are inclined to interpret this as meaning only the practice by Doctors of Medicine and not including practice by other schools of practice or cults. The suggested title would be, 'The Practice of Medicine and/or Healing' or 'The Practice of Healing.

"(*b*) Definition of the practice of 'Healing' The present definition, as given in Sec. 1250, *paragraph 7, of Art. 48 of the Education Law* was considered broad and comprehensive but it was thought that this definition might be strengthened by adding in another section of the statute a paragraph which would indicate more clearly those who would be regarded as practitioners or practicing healing or treating the sick Such paragraphs are found in the laws of other states. The New Jersey Law has such a paragraph (N J 45-9-18) which ends with the following sentence

'The provisions of this Chapter shall apply to all persons professing and attempting to cure disease by means of the so-called system of 'faith-curism' 'mind-healing,' 'laying-on-of hands,' and other similar systems.'

It is suggested that such a paragraph might be inserted in Section 1263, of Art. 48 of the Education Law

"(c) Consideration was given to the suggestion that an amendment to the statute be made which would require anyone who holds himself out for any practice which would come under the definition of 'The Practice of Healing' shall have met the educational requirements, both preliminary and professional, as prescribed by statute and regulations of the Department of Education and shall have passed an examination given by the Department of Education or acceptable to the Department which shall be the same for all schools of practice, at least in the subjects pertaining to diagnosis and the sciences of anatomy, physiology, chemistry, pathology, bacteriology, and hygiene Such requirement would not be necessary for licensure in the branches of the healing arts which are now licensed by separate boards of examiners, such as dentistry, nursing, optometry, podiatry, and physiotherapy It is suggested that such an amendment could be added to Sec 1261 of Art 48, of the Education Law

"(d) Injunction. In the State of Kansas it has been found that the statute permitting granting of an injunction against a person held to be practicing medicine illegally was a great aid in controlling illegal practice in that state In Veterinary Law of New York State the granting of injunction is permitted

"It is recommended by this subcommittee that a bill be submitted to amend Section 1263, paragraph 7, which would add the following and which would be new

'In addition to the prosecuting by the attorney general of a violation of any of the provisions of this article, and in addition to the remedies otherwise provided under this article, the attorney general may apply for relief by injunction to restrain the commission of any act which is illegal under this article, without being compelled to allege or prove that an adequate remedy at law does not exist, or that irreparable damage would result from the continued commission of such acts'"

Those are the suggested recommendations

Speaker Bauer And the recommendation of the Reference Committee is that these be considered, is that correct, for legislation?

Dr Moore That is correct

Dr. James F Rooney I regret I have to rise again If the order goes out from this house to the Legislative Committee of the Council of the Medical Society of the State of New York which has to take charge of all affairs before the Legislature that binds their hands as to the introduction of bills that will again reopen the Medical Practice Act to amendment by every long-haired fanatic in the Legislature, with all of the chaos that is existing in relation to medical practice in the State of New York today, unless the Council deems it advisable or expedient under the circumstances that may occur at the time of the beginning of the session of the Legislature, we are not going to amend the Medical Practice Act favorably to the public health of the people of the State of New York We are going to give an opportunity for every quack all over this section of the country to come before these legislative committees and demand equal treatment

There are times to fight, and there are times to be silent, and I think that this whole matter should be referred to the Council as a recommendation, leaving it to their discretion to direct what they feel is expedient, appropriate, and necessary in relation to any amendments to the present law, and I so move.

Dr. Herbert H Bauckus I second that

Speaker Bauer Dr Rooney moves, and Dr Bauckus seconded, to refer this to the Council with power to act as they deem fit as the circumstances develop

Dr Moore I understood this was a report of a subcommittee of a special committee that already reported to the Council

Speaker Bauer These were the recommendations

Dr. Rooney And according to my amendment the House refers those recommendations to the Council with power to act as their discretion dictates

Speaker Bauer Is there any discussion of the amendment?

Dr. George W Cottis I agree with Dr Rooney that there are times to be silent and there are times to speak out This whole question of the suppression of cultism in this state has been a headache to us for years This subcommittee has produced what I think is a very workable solution, or at least it is a long step toward a solution We have heard the thing discussed year after year, and it is important enough so that I think this House of Delegates should be the agent to decide on the question of our policy

I agree with Dr Rooney except in this respect, that I do not think this is the time to be silent, but it is a time to be heard, and I would oppose the amendment as I think the committee has done a swell job, and we should put this thing over right now

Dr. Harry Aranow As a former chairman of the Committee on Legislation of the Medical Society of the State of New York for a period of ten years, I can tell you from personal experience that an order like that would embarrass your Legislative Committee if they attempted to put through a bill when they positively knew in advance it would be defeated, and it may also do the medical profession harm

I would suggest that these recommendations be referred to the Chairman of the Legislative Committee, whoever he may be, for discussion, because before he acts he always does it, or usually at any rate, with the consent of the Council—

Dr Rooney The Council first and then the Legislative Committee

Dr. Aranow Yes, refer it to the Council, and they will instruct the Legislative Committee, but if you order him to do it now he has to do it, and he may know positively at the time that it is going to be defeated or going to do harm This is a bad proposition to pass

Dr. Joseph A. Geis, *Essex* After listening to Dr Rooney talk on legislation for a period of thirty years, I have learned to have a lot of respect for his opinion, and I believe this body should follow Dr Rooney's recommendation.

Dr. Rooney I just merely want to say that I entirely concur with Dr Cottis in hearty approval of the recommendations of the committee Every one of their suggestions are necessary I may not agree with the verbiage, but the thing that I oppose, and try to avoid by my amendment, is to practically take a club in the hands of the House of Delegates, who are totally unfamiliar with legislative procedure in the main, and direct the Legislative Committee to use that club upon the Legislature whether they are one against five thousand or one against three.

I feel that the wise plan is to put it in the hands of

the Council, upon whom you can depend The Legislative Committee is a Council Committee, and as such is subordinate to the direction of the Council. Every member of this House can, by correspondence with the members of the Council express his opinion in relation to the matter, and be sure, gentlemen, that the Council will absolutely conform, as far as they can, with your direction.

DR. MARTIN B TINKER This is essentially the thing that Dr Van der Veer fought for years. As Dr Rooney just presented it to you, I think it should not be turned down

DR. MOORE It is your Reference Committee's understanding that this report does not ask the House of Delegates to direct anything to anybody These are deliberations by a subcommittee of the Council, and are presented to the House of Delegates as giving approval for further discussion or not. There is no mention, and I made no mention, of a directive to anybody to stimulate legislation They are recommending this

DR. ROONEY I regret I misunderstood Perhaps it might have been my impaired hearing, but I felt there was a directive requested by the House of Delegates that the Medical Practice Act should be changed in this regard I am familiar with the report of the Council Committee from which these questions primarily emanated, in fact I have been in on the discussions. The mere fact that that Council Committee put these questions meant that in their own mind there was a doubt as to the advisability of practically requiring that the Act be amended.

I think, then, that the wise thing to do will be to pass my motion which refers this matter to the Council and to this committee in cooperation with the Legislative Committee, and I feel it should be referred to them for consideration and action if they feel it is advisable

SPEAKER BAUER If the Chair may interpolate his understanding of the action of the Council in referring these questions to the House of Delegates was to ask the authority of the House of Delegates to go ahead with such action as it might be deemed advisable. It felt it needed the backing of the House to take such specific action as proposing amendments to the Medical Practice Act, and it was not asking that the House direct it but that the Council be given the opportunity to do it. That was the recommendation of the Council in referring this matter to the House of Delegates. I don't know just what the Committee s report says on that.

DR. ROONEY May we have the recommendation of the committee again?

Dr Moore reread the suggested changes

DR. MOORE Your Reference Committee notes that the subcommittee has again reviewed the feasibility of seeking a change in the Medical Practice Act. It has given special attention to the information obtained from other states and believes the discussion was thorough and that conclusions drawn by the subcommittee are sound Therefore, the reference committee recommends the adoption of this report.

SPEAKER BAUER The Chair would rule that the report of the Reference Committee did not cover the Council s recommendations so I believe that Dr Rooney's motion, if you agree with it would still be necessary The question is then upon the adoption of Dr Rooney's amendment

DR. COTTIS Just one more word, I am perfectly willing to have this thing referred back to the Council for action but we have had submitted to us a series of questions, and as a matter of information I would like to ask whether this action does give affirmative reply to those questions. I want this House of Delegates to go on record as approving those recommendations

SPEAKER BAUER The Committee's report does this This is simply giving specific direction to the Council rather than to any other body

DR. COTTIS O.K., as long as that is understood

The question was called for, and the motion was put to a vote, and was carried

SPEAKER BAUER That portion of the report is adopted

DR. MOORE Question IV—Whether to—

SPEAKER BAUER You forgot Question III

DR. MOORE Oh, yes

"Question III—Whether the present Medical Practice Act should be changed to admit cults under standards equal to those required of medical graduates.

"The subcommittee does not recommend changing the present Medical Practice Act to admit cults to licensure for practice or such recognition of cults. It has suggested that consideration be given to amending the Medical Practice Act so as to require the same education standards and examination for all who hold themselves out for any practice which would come under the definition of 'The Practice of Healing.' (Subdivision (C) of this report.)"

Your Reference Committee recommends the adoption of that section, and I so move.

SPEAKER BAUER In other words, the recommendation is that the Medical Practice Act be not amended to recognize cults, is that right?

DR. MOORE Yes

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. MOORE Continuing

"Question IV—Whether to recommend or not to recommend a 'Basic Science Law' for New York State."

Then there follows in this report that was referred to your Reference Committee

"The Special Committee to study the question of medical practice and this subcommittee has given a great deal of time to this question. Members of these committees have reviewed material on the laws of the states having a basic science law, reports from various sources on the effect of such a law in those states, reports presented in person and written material from persons favorable to a basic science law in New York State, and articles published on basic science laws.

'It was suggested that in presenting this report, a definition of the term 'basic science law' be given so that there will be no misunderstanding as to the meaning of this term.

"A basic science law would be an act that would establish a state board of examiners in the basic sciences underlying the practice of the healing art would provide for its organization and powers, would provide that certification by that board be a prerequisite to eligibility for examination for license to practice the healing art, and would define the healing art.

"The usual definition of the term 'healing art brings within its scope nonsectarian medicine osteopathy' chiropractic, naturopathy, sani practice, naprapathy, and other modes of healing It would include dentists, nurses chiropodists

pharmacists, optometrists, physiotherapists, and others, but these are usually excepted from the operation of the act

"Under such an Act no person would be permitted to take an examination for a license to practice the healing art or any branch thereof, or be granted any such license, unless he has presented to the Board or officer empowered to issue such a license as the applicant seeks, a certificate of ability in anatomy, physiology, chemistry, bacteriology, and pathology (usually referred to as the basic sciences, although some states include the subjects of hygiene and diagnosis), issued by the State Board of Examiners in the Basic Sciences

"The Board of Examiners in the states having a basic science act is made up of scientists who are not practitioners of the healing art, and not on the faculty of a school of healing art, or the Board may be a composite Board made up of a doctor of medicine, osteopath, chiropractor, scientist, naturopath, etc , having a member from the various schools or cults to be licensed

"This subcommittee, after reviewing a great amount of material, is of the opinion that there are the following arguments for a basic science law

(1) In states which have separate licensing boards for different schools of practice and which have no common standard for licensure for all schools of medicine and the cults licensed to practice in that state, the basic science examination is a necessary protection for the public

(2) In those states where charges of illegal practice may be prosecuted without trial before jury, the law against illegal practice may be enforced more easily when a basic science certificate is required

(3) It is also claimed that by passing a basic science law, new cults would be prevented from obtaining licensure, and the frequent battles against such legislation to grant licensure to new cults would be avoided

"The members of this subcommittee are of the opinion that the reasons for not favoring the passage of a basic science law at the present time are as follows

(1) In New York State, where graduates of all schools of medicine take the same examination for licensure, such a law is not necessary for the protection of the public

(2) In New York State, where prosecution of illegal practice is by the attorney general and usually before a jury, convictions would be fully as difficult to obtain when the respondent is charged with practicing without a basic science certificate or exceeding the limits of his license in his practice as it is under the present law Other states having a basic science law have found this to be so

(3) In some states having a basic science law, new cults are trying to obtain licensure and there are frequent legislative battles against the granting of such licensure, and battles to retain or prevent change of their basic science law

(4) Recent attempts to pass a basic science law in California failed by a vote of about 2 to 1 Basic science laws in Kansas and Tennessee were nullified by last-minute amendments

"This subcommittee, after careful study of the reasons for and against a basic science law for New York State, recommends that the Medical Society of the State of New York go on record as being opposed to the principle of a basic science law for this state at this time"

Your Reference Committee recommends the adoption of that section of the report, and I so move.

The motion was seconded

SPEAKER BAUER The question now before you for discussion is the Committee's recommendation that the Society do not favor a basic science law at this time Is there any discussion?

DR ROGER A. HEMPHILL, *Livingston* It is almost a tradition in this Society that it is almost against the constitution and bylaws for a session of this House of Delegates to go by without the delegate from Livingston County talking about the Basic Science Law While the hands may be the hands of Esau, the voice is still the voice of Jacob

The chiropractors, as we well know, are licensed in forty-four states There is no reason to expect that New York State will much longer fail to succumb We know that other cults have preceded chiropractic We know that more cults will come in the future, and if we live long enough we will see one die out and another come along We know that chiropractors at the present time are actively engaged in practicing in this state Dr Bauckus presented yesterday some nice advertisements from Detroit, but he did not need to go outside of Buffalo to find illustrations of the fact that they publicly practice their profession in his own community As far as the Classified Directory of the telephone book is concerned, you cannot tell whether they are licensed or not, in other words, should they actually succeed in being licensed there will be no difference as far as the public acknowledgment of their situation is concerned

One of the means which has been used in the control of cults, such as chiropractic and others, is that of the basic science law It has been adopted in seventeen states In not all states is it an ideal solution Of course, we don't approve of cults We don't approve of divorce, but we have divorce laws, and there is a considerable difference between the laws applying to divorce in New York State, for example, and Nevada, and the laws of Nevada obviously would not meet with the approval of a good many people in other states So if we were starting from scratch, as we are in this state, we should be able to put in a law on chiropractic and on other cults which would be effective in controlling them In this connection, I may point out that a combination of the laws in Minnesota and Rhode Island particularly would make for an ideal law

As far as enforcement is concerned, where the law is relatively new or where there are basic defects, because usually chiropractors have been licensed before this law has been passed, obviously enforcement is not particularly good, but in a state such as Minnesota, where two hundred and fifty prosecutions have occurred, with 90 per cent convictions, it looks as though the law is reasonably successful

The Livingston County Medical Society is not absolutely sold on the basic science law It does not regard it as being the fountainhead of all wisdom on the control of cults It is a solution No other solution that I know of has been presented We would be glad to accept another which would appear to be better

DR. GEORGE W COTTIS Mr Speaker, the reason that I got all heated up a minute ago was that I was afraid that this House was not going to approve these resolutions, which are the best constructive steps toward meeting the cult problem

The last time I remember anything being done to combat this situation, we agreed to tax ourselves $2 per year in order to pay the government s expenses for doing its duty, but as you know that $2 might as well be thrown out of the window

I am qualified to speak about basic science laws at least as much as about 90 per cent of the men in this room, because I know as much as they do about the subject, which is practically zero I don't know anything about it but it seems to me that it is rather foolish for us to come up here year after year and discuss this problem without having some authentic information about what it is all about. The idea in my mind is this I understand that the subcommittee has spent a great deal of time and has made a very impartial study of this whole question, that they have written to the secretaries of the various state medical societies to find out what has occurred in these states where they have adopted a basic science law and closed the barn door after the horse has fled They have all that information and I have confidence in their integrity and in their ability to analyze that information The proposal I would like to make is this that for our own good and for my edification this committee or some person delegated by the committee shall collate this information which they have secured from all over the country and abstract the essential points where the law has worked and where it has not worked, why it has not worked, and whether the A.M A is wrong when it goes to the trouble of preparing a model act for us to follow, and then have a condensed summary of all their findings published in the JOURNAL of the State Society After that, we can read these facts and have something authoritative to base our opinions on, and we will no longer be compelled to depend on what we hear out in the corridor

Three or four years ago I was sold on this basic science law, then I met Dr Hannon in a corner out here somewhere and in three minutes he changed my mind the other way Then the next year I met somebody who quoted a lot of facts and figures from the State of Washington and from the State of Minnesota, and I said to myself, "My God that must be the answer that must be the solution.' Then I swung over the other way again Well I am sick and tired of being a pendulum swinging from one side to the other I would like to have something to go on, and if it is in order I would move as an amendment that the findings of this subcommittee be published in the JOURNAL.

SPEAKER BAUER I think your amendment is hardly germane to the question, which is the disapproval of the basic science law in this state Let us first dispose of that, and then I will be glad to recognise you so that you can put that as a motion.

DR. COTTIS Very well

The question was called, and the motion was put to a vote, and was carried.

SPEAKER BAUER Dr Cottis, I will now be glad to have your motion, and to save time I will simply say that Dr Cottis moves that the information which has been collected by this subcommittee be edited and published in the JOURNAL for the information of every member of the Society

DR. COTTIS Right.

SPEAKER BAUER Is that seconded?

The motion was seconded, and as there was no discussion, it was put to a vote and was carried.

SPEAKER BAUER Thank you Dr Moore.

DR. JAMES F ROONEY May I call attention to a point of order? I think that the Chairman of this Committee, which has rendered such outstanding service, did not move the adoption of his report as a whole.

SPEAKER BAUER I disagree with that because each article was an independent item and had no relation with the other There were ten separate and distinct matters.

DR ROONEY I defer to the decision of the Speaker, as long as it is official

Section 108 (*See 59*)

Further Report of Reference Committee on Report of Council—Part XIII Malpractice Defense and Insurance and Legal Counsel

DR. WILLIAM B RAWLS, *New York* Report of the Legal Counsel Your Committee wishes to emphasize that part of the counsel's report which calls attention to the dangers of careless criticism by one physician upon the work of another, and the malpractice suits resulting therefrom The Committee feels that this cannot be too strongly emphasized.

Your Committee wishes to compliment the Counsel upon his successful disposal of the large percentage of malpractice suits and also upon his preventive work in solving many problems that do not come to the state of actual suit.

The Reference Committee recommends a vote of thanks to the Counsel and his entire staff

Mr Speaker, I move the adoption of this portion of the report of Reference Committee on Part XIII of the Council's Report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Section 109 (*See 10*)

Report of Reference Committee on Report of Council—Part IV Public Health Activities

DR. ROY B HENLINE, *New York* The report of the Council on Public Health Activities reflects a wide range of constructive effort and accomplishment. Your Reference Committee offers the following specific comments on the various sections of this report

1 *4-H Clubs and Youth Health Activities* —The State Society owes a debt of gratitude to Dr J G Fred Hiss, of Syracuse for his work with the 4-H Clubs Through this work the State Society is rendering a distinct contribution to the public health in general and is helping to stimulate the 4-H Clubs to have a satisfactory rounded health program. The work of this committee in helping to educate people on the prevention of home and farm accidents is also worthy of commendation

2 *Blood and Plasma.*—The law enabling the State Commissioner of Health to set up a plan for preparation and distribution of blood and plasma upstate was adopted by the Legislature this year and the program is in process of being carried out

Because of the increased need for and interest in the development of blood banks it is important that the highest standards be maintained in the technic and ethics of operation.

Your Reference Committee, therefore, recommends that only hospitals or competent physicians be permitted to control, operate, or direct blood banks, and that ownership should not be in the hands of laymen.

I move the adoption of this section of the Committee s report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. HENLINE 3 *Cancer*—The liaison between the American Cancer Society and the State Medical Society to promote public education as well as the education of doctors in regard to cancer problems is worthy of praise and commendation

4. *Dental Health*—The joint action of the State Medical Society and the dental societies regarding dental health should be continued and promises great benefits in the future

5 *Hard of Hearing and the Deaf*—The increase in the number of "Hearing Clinics" throughout the State should be commended If these clinics are strategically placed, and operated as prescribed by your Committee, they should be of great help not only to the public, but also to the practicing physician

6 The work of your Committees on War Medicine and Surgery, New York State Commission for the Blind, Infantile Paralysis, Rheumatic Fever, and Rheumatic Heart Disease is all worthy of the highest commendation

I move the adoption of this portion of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. HENLINE Now I move the adoption of the report of the committee, consisting of Jacob Werne, Joseph H Cornell, Donald Malven, and Roy B Henline, as Chairman, as a whole

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

SPEAKER BAUER Thank you, Dr Henline

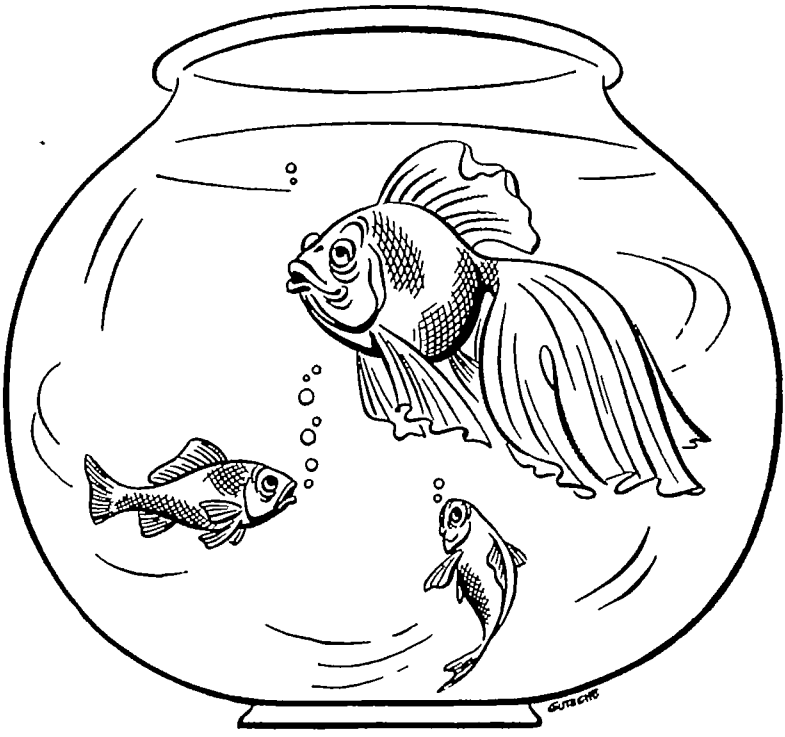
Gentlemen, We have two more reports One is the Report of the Planning Committee and the other is the Report on Workmen's Compensation Both of these are long, but I believe we will be able to dispose of them while the tellers are counting the ballots

We are now scheduled to meet at 1 00 P M , so we just have half an hour until that time Remember you will all have to be checked in at the door when you come in this afternoon, which will consume some time, so I think if you would be willing to postpone your lunch until after the afternoon session we would get along better A lot of men have asked me very earnestly to be allowed to make the 3.30 P M train, and I want to grant that request if I can As I say, we have cleared up all the business except these two reports and the election and various small items that have to be done this afternoon, so I think if you would start checking in by 12 45 P M it would help

Section 110

Elections

SPEAKER BAUER While I am on this subject of the elections, in order to save time I am going to announce the tellers now so they will be ready and here early



TELLERS

Charles F McCarty, *Kings*, Chairman
Jacob L Lochner, Jr , *Albany*
Goodlatte B Gilmore, *Bronx*
Renato J Azzari, *Bronx*
Elton R Dickson, *Broome*
Alfred K Bates, *Cayuga*
Robert Brittain, *Delaware*
Joseph A. Geis, *Essex*
Ben A Borkow, *Kings*
Leo S Drexler, *Kings*
Joseph Tenopyr, *Kings*
Leo S Schwartz, *Kings*
John L Norris, *Monroe*
Philip D Allen, *New York*
Edward Percy Eglee, *New York*
Samuel Z Freedman, *New York*
Erwin Beckhard, *Queens*
Frank J Carniglia, *Queens*
Jacob Werne, *Queens*
Joseph H Cornell, *Schenectady*
Edwin L Harmon, *Westchester*
Paul Wood, Section Delegate

SPEAKER BAUER We will now be in recess until 1 00 P M , but please start checking in at the door at 12 45

The session recessed at 12 30 P M

[*To be concluded in the January 15 issue*]

Different in form

Honey like liquid form and strictly professional promotion are two unique advantages of Maltine with Vitamin Concentrates These features afford the physician better prescription control Moreover patients are pleased with the pleasant citrus flavor the effectiveness and the economy of this balanced multiple vitamin preparation Each fluid ounce contains:

Vitamin A	*10,000 U.S P Units*
Vitamin D	*1000 U.S.P Units*
Vitamin B_1	*3 Mg Thiamine Hydrochloride*
Vitamin B_2	*4 Mg Riboflavin*
Nicotinamide	*40 Mg*
Pantothenic Acid	*350 Micrograms*
Dicalcium Phosphate	*17 Grains*
Maltine	*q s*

Dosage: Two teaspoonfols twice a day Available through prescription pharmacies in bottles of 12 fluid ounces. The Maltine Company New York. Established 1875

Maltine with Vitamin Concentrates

WILLIAM F MARTIN, ESQ

COUNSEL TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Disciplinary Proceedings—Splitting of Fees

THE Appellate Division of the Supreme Court of this State has very recently handed down a decision of considerable interest involving disciplinary actions in connection with splitting of fees by dentists

Charges were brought against Dr B, a licensed dentist for many years, that from 1939 to 1942 he had in his employ a certain layman whose duties were to obtain patients for dental treatment, and that he had paid commissions to the layman on the fees collected from such patients It was charged that such conduct was unethical, as specifically stated in the codes of ethics promulgated by the American Dental Association, the Dental Society of New York, and the First District Medical Society The charges were tried and upon the findings of the Dental Board, the Board of Regents found the dentist guilty of unprofessional conduct, and suspended for a year his license to practice dentistry The dentist instituted proceedings for court review of the determination of the Board of Regents, and the Appellate Division of the Third Judicial Department upon such review directed that the determination of the Board of Regents and the order of suspension should be annulled *

The Dental Practice Act contained in the Education Law prescribes cases in which disciplinary action against a practicing dentist is authorized Section 1311 of that law includes as such grounds for action the following (a) immoral conduct, (b) gross negligence or inefficiency, (c) fraud and deceit in the practice of dentistry, (d) and (e) aiding and abetting unlicensed practitioners to practice, (f) conviction of a crime, (g) advertising by specific means, or (h) "that the dentist has been otherwise or in any other way guilty of unprofessional conduct" The said section of the law authorizes the Board of Regents to promulgate rules to define and clarify unprofessional conduct

It was conceded before the Court that neither the Commissioner of Education nor the Regents had specifically defined "unprofessional conduct" so as to cover the situation under review The Code of Ethics of the American Dental Association and of the various dental societies, however, contained a section declaring it to be unethical for dentists "to pay or accept commissions in any form or manner on fees or professional services" It was stipulated for the purpose of the legal proceedings that Dr B was not a member of any of the dental organizations to which reference has been made

The facts of the alleged grievance against Dr B were, briefly stated, substantially as follows

The layman, one A, had been a seaman and was "Scandinavian born" He procured patients for his employer, Dr B, who were sailors, temporarily living along the waterfront or on board ships in port Undoubtedly, the patients so brought to the dentist were in need of dental care, and it was claimed that they would have gone without such care had it not been for the activities of A, the so-called "runner," who sought them out and brought them to Dr B A would receive telephone calls from Scandinavian ship companies that crew members needed dental care and would take them to Dr B's office and then drive them back to their ship Commissions were paid by the dentist to A based upon the fees collected, and certain other expense allowances were also paid to him

The Appellate Division ruled that under all the circumstances present the petitioner was entitled to a dismissal of the charges, and the reasoning by which such decision was reached was stated in the Court's opinion as follows

"The determination that the petitioner's conduct as charged and proved was professional misconduct, has been found to rest upon its having been denominated unethical in the codes of above-named dental societies It has no other basis in the record or in law Codified ideas of unethical conduct held by certain privately organized groups within the profession have been used to particularize the generality of the omnibus term, and to constitute a cause for disciplinary penalty, 'after the fact'

"The phrase 'otherwise or in any other way guilty of unprofessional conduct,' under which the penalty in question was imposed, is otherwise undefined by the statute or any rule or regulation made by any lawful supervising authority The phrase itself establishes no standard by which the best disposed practitioner could avoid the pitfalls of possible violation and prosecution The statute is penal in nature and what has been said regarding the definition of statutory offenses seems apt 'The citizen is entitled to an unequivocal warning before conduct on his part, which is not *malum in se*, can be made the occasion of a deprivation of his liberty or property' (People vs Phyfe, 136 N Y 554, 559, see, also, People vs Grogan, 260 N Y 138) The argument that the codes of ethics of dental societies were sufficient to put him on his guard and erect the standard for his conduct contains the fallacy that the Legislature has not delegated its power of further permissible specification to the respondent alone The latter may not, in effect, surrender that power to unofficial bodies by using their codes in default of an exercise of its own power to erect and prescribe canons or regulations which will serve 'to apprise all practitioners of the standards which (it) the official body authorized to supervise the profession deems necessary,' and to the end that 'those who choose to disregard the warning do so at their peril' (Matter of Cherry vs Board of Regents, 289 N Y 148, 159) In the latter case it was written, at page 158, that 'Every member of the profession should be regarded as an expert' for the purpose of determining the 'consensus' as to the necessity and propriety of standards of conduct, viz 'ethic and, at page 159, that 'The Legislature has delegated to the Board power by rule to specify a

define conduct which by consensus of expert opinion in the profession is unethical and does not conform to standards which are necessary, and power to decree that such reprehensible conduct should not go unwhipt of justice Through the exercise of that power it can adequately supervise the practice of dentistry and ban conduct dictated by "vulgar commercialism" ' In the case at bar not only did the respondent Board fail to exercise its delegated power to 'specify and define conduct which by consensus of expert opinion is unethical' but, it is to be noted, there has been no finding that petitioner's conduct departed from the standard erected by the consensus of expert opinion The respondent has not found and stated the consensus Instead, its finding is only that his conduct did not conform to a standard erected by privately organized groups within a profession wherein every member is an expert as to what the standard should be In the Cherry case (supra), where the disciplinary action was annulled, the standard found to have been departed from had been erected by the Board, but it was held to have been beyond its delegated power as regards the proof there relied on There the gravamen of conduct charged had to do with advertising, not fee-splitting or the payment of commissions, and until the lawful supervisory official body determines that the consensus is against the latter conduct, it may not condemn and adjudge it to be unprofessional conduct "

It should be noted that this case is presently pending before the Court of Appeals for further review

If similar charges should be made against a physician, of course, a different situation would be presented The Medical Practice Act now contains a provision which should be broad enough to cover the situation It is provided in Section 1264 of the Education Law as one of the grounds for discipline

"(f) That a physician has directly or indirectly requested, received, or participated in the division, transference, assignment, rebate, splitting, or refunding of a fee for, or has directly or indirectly requested, received, or profited by means of a credit or other valuable consideration as a commission, discount, or gratuity in connection with the furnishing of medical, surgical, or dental care, diagnosis or treatment, or service, including x-ray examination and treatment, or for or in connection with the sale, rental, supplying, or furnishing of clinical laboratory services or supplies, x-ray laboratory services or supplies, inhalation therapy service or equipment, ambulance service, hospital or medical supplies, physiotherapy or therapeutic service or equipment, artificial limbs, teeth or eyes, orthopedic or surgical appliances or supplies, optical appliances, supplies or equipment, devices for aid of hearing, drugs, medication, or medical supplies, or any other goods, services or supplies prescribed for medical diagnosis, care, or treatment under this chapter, except payment, not to exceed 33⅓ per centum of any fee received for x-ray examination, diagnosis, or treatment, to any hospital furnishing facilities for such examination, diagnosis, or treatment "

INFLAMMATORY LIVER DISEASE IS INCREASING IN FREQUENCY

Infectious hepatitis—an inflammatory disease of the liver—is increasing in frequency in this country, both among civilians and among military personnel, three Army investigators report in the *Journal of the American Medical Association* for August 4

Col M Herbert Barker and Maj Richard B Capps, (MC),AUS, and Maj Frank W Allen, (SC),AUS, conducted an organized study of the disease as it occurred among troops in the Mediterranean theater "From this work," they say, "it has become apparent that many of our older concepts, especially regarding diagnosis, duration, and treatment, must be altered "

The officers point out that "for many years prior to this war infectious hepatitis was considered to be a relatively infrequent and unimportant disease During the last four years, however, cases have been appearing in increasing numbers in both civilians and military personnel in various parts of the world "

Infectious hepatitis is usually accompanied by jaundice The flow of bile, which is secreted by the liver, may become obstructed by the inflammation, This obstruction to the flow of bile does not suppress its secretion, and therefore the bile, unable to escape into the intestines, seeps into the blood Thus it is carried to all the tissues of the body, giving the yellow coloration to the whites of the eyes, the skin, and the perspiration that is characteristic of jaundice

During the first stage of the disease, which precedes the appearance of jaundice, there is a rise of temperature with chilly sensations Characteristic symptoms are headache, lassitude, abdominal discomfort, and loss of appetite, followed by nausea and vomiting During this period, which lasts from one to three weeks, the problems of diagnosis are difficult "It is usually necessary," the article points out, "to await the appearance of an enlarged tender liver or of jaundice before the diagnosis can be established "

"The cardinal principles in the management of acute infectious hepatitis," the authors stress, "are early and adequate rest and proper diet We have very strong evidence that early and reasonably complete bed rest for an adequate period will decrease the severity and shorten the duration of the disease and decrease the percentage of cases with delayed convalescence We have also found that a high-protein, low-fat, and high-carbohydrate diet has a similar effect "

They state that on the basis of experimental evidence it appears that the high-protein constituent of this diet, especially beef, milk, and cheese, is the most important factor of treatment This is contrary to the older concept of administering a low-protein diet There is no evidence that excessive amounts of vitamins are desirable "On the contrary," they say, "too much vitamin B_1 may be harmful "

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL *The members of the committee are Oliver W H Mitchell, M D , Chairman (428 Greenwood Place, Syracuse), George Baehr, M D , and Charles D Post, M D*

Instruction to Schenectady County Society

THE Relief of Medical Conditions by Ablation of Sympathetic Nerve Impulses" is the subject of a lecture to be given on January 8 to the Schenectady County Medical Society Dr Frederick S Wetherell, professor of clinical surgery, Syracuse University College of Medicine, will speak.

The meeting, arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, will be held in the library of the Ellis Hospital, Schenectady

Hematologic Disorder

A GENERAL résumé of hematologic disorders, including the anemias, was outlined by Dr Ellery G Allen, associate professor of clinical medicine and assistant professor of clinical pathology, Syracuse University College of Medicine, at a meeting of the Ulster County Medical Society, held on December 5 at 9 00 P M in the library of the Kingston Laboratory, Kingston

Dr Allen's postgraduate instruction has been arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

Lecture Series for Saranac Lake

A SERIES of postgraduate instructions has been arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York for the Saranac Lake medical Society on Wednesday evenings at 8 00 P M in the John Black Room of the Saranac Laboratory, Saranac Lake

The first one was given on December 5 by Dr Henry Field, Jr , associate professor of medicine, University of Buffalo School of Medicine, on "Management of Diseases of the Coronary Vessels"

On December 19 Dr Stuart L Vaughan, assistant professor of medicine, University of Buffalo School of Medicine, spoke on "Results and Modern Methods in the Treatment of Anemia"

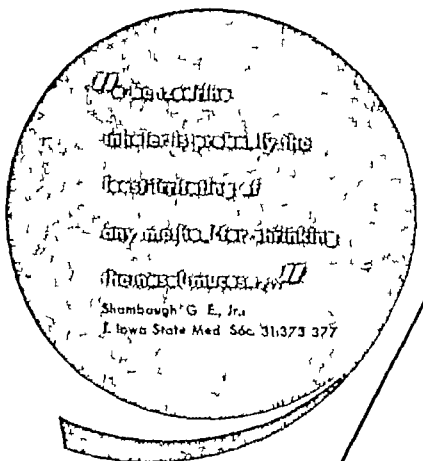
The final lecture of the series will be given on January 16 by Dr L Maxwell Lockie, who will discuss "Management of Arthritis, Acute and Chronic"

Dr Lockie is professor and head of the Department of Therapeutics at the University of Buffalo, School of Medicine

Otsego County Hears Dr Wolff

THE Otsego County Medical Society was given postgraduate instruction on the subject of the headache on December 19 by Dr Harold G Wolff, associate professor of medicine, Cornell University Medical College

The meeting was held at the Tunnicliff Inn Cooperstown.



The instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York

Anemia and Virus Pneumonia

ON DECEMBER 12 Dr Paul Reznikoff, associate professor of clinical medicine, Cornell University Medical College, spoke to the Sullivan County Medical Society on the subject "The Diagnosis and Treatment of Anemia" The meeting was held at the Lenape Hotel in Liberty

The next lecture for the Society, arranged jointly by the Council Committee on Public Health and Education of the Medical Society of the State of New York and the State Department of Health, will be on January 16 at the Monticello Hospital in Monticello It will be given by Dr Paul C Clark on the subject of virus pneumonia Dr Clark is assistant professor of clinical medicine and clinical pathology at the Syracuse University College of Medicine

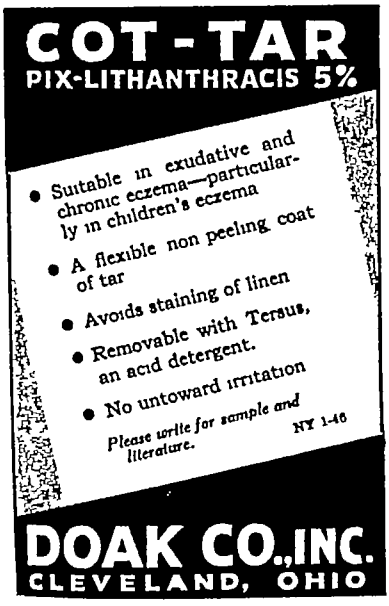
SHOCK THERAPY AND THE CONDITIONED REFLEX

Since Pavlov's and Cannon's early studies upon the conditioned reflex, examples of which are salivation or gastric secretion of an animal following the ringing of a bell, flash of light, sound of a tuning fork, or other stimuli repeatedly offered before a meal, the conditioned reflex has been one of the important methods of analysis of animal behavior Negative conditioned reflexes are also, of course, useful—as the presentation of certain sounds before an unpleasant electric shock The animal may be taught to distinguish between certain musical notes He may receive food after a low note and electric shock after a high note, and his musical ear thus studied by bringing the two notes closer and closer together until the distinction is too difficult, as in the case of the neurotic pigs who became completely distracted and ill from the difficulty of their task.

The conditioned reflex offers an objective method of study of the simplest form of mental content It may be used upon small laboratory animals and will perhaps eventually provide a simple alphabet for psychiatry It is something that the animal learns by experience, or inductively He will forget it if conditions are altered and he gets the stimulus repeatedly without the expected reward Thus memory is involved



Gellhorn,* among other investigators, working in the Universities of Minnesota and Illinois, has studied the effect of insulin shock and electrically induced convulsions upon the memory of the conditioned reflex of the rat The rat is first taught the reflex, then made to unlearn it That is, the stimulus is administered without the reward until the animal ceases to respond It is noted that the rat learns to respond to auditory (bell, musical note) stimuli much more readily than to visual (light) stimuli

Forgotten conditioned reflexes returned rapidly after insulin coma had been induced. Particularly, previously learned conditional reflexes to sound were restored in high degree after insulin coma Response to light was less markedly restored, Gellhorn believes, because it is less thoroughly learned Return of reflexes after shock therapy seemed to depend upon the degree to which the reflex had been perfected before it was inhibited The inhibited reflexes were restored but other conditioned reflexes were not diminished. Thus a definite effect of shock therapy upon mental content would seem to be demonstrated There is a sudden return to well-learned lessons, abandoned from disuse

In cases of several types of insanity, insulin shock and other modes of convulsive therapy have been employed. The mode of action in reported successful cases is of interest Is it through restoration of individual memory in persons who have forgotten the normal reactions of life?

Memory of the conditioned reflex perhaps can provide a beginning of an objective line of study of the simplest thinking processes, perhaps eventually of the inhibitions which underlie many forms of mental disease.—*South M J, Sept, 1945*

Hospital News

Newsy Notes

A $6,000,000 veterans hospital is to be built on an 18-acre site in the Fort Hamilton Military Reservation in Brooklyn, Gen Omar N Bradley, Veterans Administrator, announced on October 8 in Washington

The 1,000-bed hospital will be designed for general medical and surgical cases Funds for its construction are included in the 1946 appropriation act, the Independent Offices Bill The Veterans Administration is acquiring the site by transfer from the War Department, and right of entry already has been granted

• • •

Plans have been announced by Elisha Walker, chairman of the board, for the new seven-story Beekman-Downtown Hospital to replace the present Beekman and Downtown Hospitals, recently consolidated The new hospital, which will have twenty-five more beds than the present structures, will be erected on a recently acquired site at William, Beekman, and Spruce Streets

Subject to the approval of municipal authorities it is planned to create an extra street at the east end of the building from Beekman to Spruce Street to expedite ambulance and emergency care in specially planned facilities. The new building will have an outpatient department, clinic, and health-review facilities, and there also will be initiated a service for periodic health examinations for employers and employes

Besides private and semiprivate rooms, there will be sufficient available ward beds to care for emergency requirements arising in lower Manhattan with its daytime population of 700,000 and resident population of 45,000

Purchase of a site with an area of 30,000 square feet for the new Beekman-Downtown Hospital in the downtown financial district was announced by Mr Walker *

• • •

A check for $11,000 to finance an antituberculosis program at St Clare's Hospital, in New York, was received on October 11 by the Rev Mother Alice, head of the hospital, at ceremonies at the St Regis Hotel The check, which was raised by a committee of businessmen, was presented by William M Holmes, president of Bonwit Teller and Co , committee chairman

Saying that the committee's gift would be used to purchase x-ray equipment, Dr James S Edlin, medical director of diseases of the chest, declared that all patients admitted to the hospital, rich and poor, would have the benefit of a routine chest x-ray examination Such examinations, he held, are rarely made except where the likelihood of tuberculosis is indicated, and he added that through its example St Clare's hoped to demonstrate the desirability of the procedure to other institutions *

The New York State Board of Social Welfare has granted a charter permitting the establishment of a community hospital in Riverhead, conditioned upon the raising of a minimum of $100,000 A hearing on the application submitted by a group of County Seat citizens who originated the project was held on September 18

The next step toward the nonprofit, nonsectarian institution is a finance campaign, and pledges, which will be voided if the certificate of incorporation is not filed on or before next December 31, are now being solicited George H Perkins has been chosen to act as trustee and treasurer of the hospital association *

• • •

A veterans' rehabilitation clinic was opened on November 7 at the Vanderbilt Clinic, New York City, a part of the Columbia-Presbyterian Medical Center, it was announced by Charles P Cooper, president of the board of trustees of the Presbyterian Hospital The clinic will be known as the veterans' rehabilitation clinic of the Presbyterian Hospital and will hold sessions on succeeding Wednesday nights

At the beginning the clinic will be staffed by twelve psychiatrists As need arises, the number will be increased Veterans desiring appointments should call WAdsworth 3-2500, Extension 7491 A committee of laymen is being formed to aid the clinic in problems of employment

The clinic, according to Mr Cooper, "represents a community effort to meet the needs of returned veterans for psychiatric treatment and rehabilitation" and will furnish all services free *

•

Pointing out that the need for blood for wounded sailors and marines recuperating at local naval hospitals had not slackened with the war's end, Capt E D McMorries, medical officer in command of the United States Naval Hospital at St. Albans, Queens, announced on November 2 the setting up at the hospital of a new blood bank It will provide whole blood and plasma to wounded patients at all the Naval hospitals of the Third Naval District, which comprises New York, Connecticut, and Northern New Jersey

Captain McMorries called for civilian volunteers to donate their blood at the hospital The blood bank will be under direction of Lt Oscar Auerbach, designated as plasma-bank officer for the Third Naval District Persons wishing to contribute blood should call Jamaica 6-1000 and ask for the blood bank *

• •

Operated by the Army since July 10, 1943, the Bronx Area Station Hospital has been declared surplus by the Surgeon General The hospital was taken over from the Lebanon Hospital Association, and has been used to give medical care to various military units in the metropolitan area, as well as soldiers home on furlough More than one thousand, five hundred officers and enlisted men and women have been hospitalized there *

[Continued from page 100]

training of doctors, nurses, and specialized personnel in the care of infantile paralysis patients has been started at Knickerbocker Hospital, New York City, it was announced on October 7

The new center, which will serve as a "model unit" for teaching and research, was announced jointly by Basil O'Connor, president of the National Foundation for Infantile Paralysis, George L Shearer, chairman of the foundation's Greater New York Chapter, and A. Robert Munro, president of the hospital

The teaching and research aspect of the new service will be financed by a grant of $100,000 from the National Foundation, while $425,000 from the local chapter will pay for special equipment and treatment of patients

Pointing out that the new center was not intended to provide care for all paralysis sufferers in the city, but to serve as a training center for professional personnel, Mr Munro said that when the Knickerbocker unit was in full operation, it would draw physicians from all over the country interested in treating the disease

It will give them the opportunity to study care of the disease under ideal conditions, to study the latest types of treatment At present there are 19 patients, but 35 can be accommodated.

The new unit is expected to make it possible to treat infantile paralysis cases in one hospital from the onset of the disease until final disposition instead of having patients attend several institutions at various stages of the disease for different treatment.

Dr Philip M Stimson, associate attending pediatrician at New York Hospital and associate professor of clinical pediatrics at Cornell University, will direct the new service He will be assisted by Dr Dorothy Jackson, resident physician at Knickerbocker Hospital and formerly resident physician in poliomyelitis at Willard Parker Hospital

In addition, the staff will include two physicians, five physical therapists, one occupational therapist, eighteen nurses, an executive secretary, and several persons trained in the application of "hot packs"

The new unit will occupy the entire fifth floor of the hospital Phases of treatment will include pediatric care, physiotherapy, rehabilitation and occupational therapy, and orthopedic support and reconstruction.*

• • •

A substantial move toward freeing Mount Vernon Hospital of indebtedness on two mortgages totaling $281,000 was taken on October 6 when a check for $81,000 was forwarded to the Connecticut Mutual Life Insurance Company, holder of the mortgages

The payment, made from cash already subscribed to the hospital's fund-raising campaign, will effect a sizable saving in the interest requirements, the rate of which, in itself, represents annual payments totaling thousands of dollars.

Frederick M Linder, treasurer of the hospital, stated that the payment marked the first big step toward relieving the hospital of heavy mortgage indebtedness with which it has been saddled for years. The two mortgages carry a 4½ per cent interest rate.*

• • •

Geneva General Hospital is among the fifteen hospitals of five counties which will participate in the organization to administer the award from the 37-year-old Commonwealth Fund established by the late Mrs Stephen V Harkness, oil-fortune heiress, for "the welfare of mankind" Selection of Rochester to become the center of an experiment by the Commonwealth Fund in the regional organization of hospital care was recently announced.

Chosen from among twenty medical teaching centers of the nation to test the type of area hospital development long in the minds of medical and health authorities, the Rochester region will receive $275,000 a year for five years with the possibility of renewal for an additional five years The money will be used for educational purposes and for building programs and equipment of outlying hospitals

Fifteen hospitals of five counties will participate in the organization to administer the award *

• • •

A new 1,000-bed veterans' hospital will be erected in Buffalo at a cost of $10,000,000 as part of a program approved by President Truman and announced on October 19 by Gen Omar N Bradley, Veterans Administrator

Mr Truman has approved locations for nineteen new veterans' hospitals and additions to nineteen existing facilities The Batavia Veterans Facility will be changed to a tuberculosis hospital, utilizing 294 beds, while $500,000 is provided for one hundred additional beds at Bath. Little cost will be involved in the shift at Batavia

Reason for locating the new hospital in Buffalo was availability of a large number of physicians and surgeons in that city, who would be able to give part-time service There was no indication of any change at Canandaigua

Gen Bradley declared that the hospitals and additions will provide 15,276 new beds for Veterans Administration patients "These beds," he said, "are part of the 29,100-bed program approved by President Truman on August 4, last, at which time approval was given to the program without commitment as to the location of any of the beds authorized"

The remainder of the construction program will be deferred until the next fiscal year, beginning July 1, 1946 Sites for the remaining new constructions will be announced later *

• • •

According to Col. John Hadley, manager of the Bath U S. Veterans Administration Facility, addition of a new 100-bed dormitory for women veterans at the Facility will increase capacity of the Facility to 2,006 persons At present the Facility lists 42 hospital beds and accommodations for 1,478 domiciliary veterans, for a 1,906-person total *

• • •

Plans for expanding private and semiprivate bed facilities of Binghamton City Hospital have been disclosed by the Hospital Board of Managers

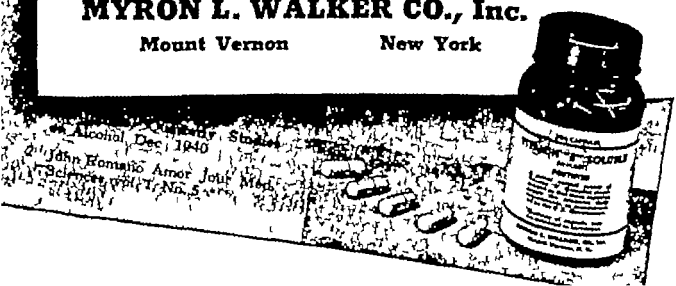
In a letter to City Council, the board said it was planned to open the second floor of the isolation building, now unused, to private and semiprivate patients

Dr Joseph F Roe, secretary of the board, said to do this it would be necessary to build a bridge connecting the rear of the isolation building with a passageway running between the Maternity and Doctors' Memorial Buildings *

[Continued on page 104]

Take Advantage of VITAMIN 'B' SOLUBLE (WALKER) IN ALCOHOLISM THERAPY

Vitamin B holds a well-recognized place in the treatment of alcoholism Alcoholic polyneuropathy is said by Jolliffe[1] to be unquestionably due to vitamin B_1 deficiency Romano[2] states that both vitamins B_1 and B_2 have definite value in this condition It is also believed that the addition of nicotinamide hastens recovery of the patient. (Spies, Sydenstricker, Jolliffe)



Vitamin "B" Soluble (Walker) supplies all the factors of the B complex, plus additional fortification of various constituents Each capsule contains 3 grains brewers yeast concentrate, 1 mgm Thiamin HCL, 1 mgm Riboflavin, 5 mgm. Nicotinamide, 30 mgm. Ascorbic Acid The dosage potency is regulated by the physician according to severity of the symptoms

The generous use of Vitamin "B" Soluble (Walker) preceding and following indulgence in alcohol, does much to prevent symptoms of depression and nervous irritability that so commonly occur In bottles of 30 and 100 capsules

Liberal samples gladly sent on request

More than three hundred and fifty of the leading administrators of the one hundred and one voluntary and municipal hospitals of Greater New York met on October 26 in the Astor Gallery of the Waldorf Astoria Hotel to formulate plans for their part in the Victory Loan campaign

John F McCormack, who heads the War Bond Committee of the Greater New York Hospital Association, and who is superintendent of Presbyterian Hospital, presided

Speakers were Cmdr G H Ekblad, senior medical officer of the carrier *Enterprise*, Lt Robert A. Sherry, AAF, a veteran of both the China-India-Burma and European fronts, Frederick W Gehle, chairman of the War Finance Committee for New York, Mrs Courtlandt D Barnes, the vice-chairman, and William E Cotter, chairman for Greater New York. Miss Rosemarie Brancato, opera and concert star, sang

The hospitals will dedicate their Victory Loan bond sales to the hospitalization and rehabilitation of wounded veterans Hospitals which achieve their goal in the drive will be awarded citations by the Surgeon Generals of the Army and of the Navy

* * *

Dr Harry Woodburn Chase, chancellor of New York University, and William H Zinsser, president of the Board of Trustees of Lenox Hill Hospital, have announced that a teaching affiliation has been established between the New York University College of Medicine and Lenox Hill Hospital

Under the terms of affiliation the teaching program at Lenox Hill Hospital will be established on the graduate and postgraduate level, as well as on the undergraduate level

For some years undergraduate elective courses have been given at Lenox Hill by the directors of the surgical services, Dr Carl Eggers, Dr John Gerster, Dr Otto Pickhardt, and Dr DeWitt Stetten, who also hold the posts of clinical professors of surgery at New York University In addition, the cardiac clinic at Lenox Hill, under the direction of Professor Clarence de la Chapelle, assistant dean of the New York University College of Medicine, has been utilized for elective work in the junior and senior years The new affiliation also makes possible the extension of undergraduate teaching to other departments of the hospital

On the graduate level, internships, residencies, and also fellowships which may be established at the hospital will carry with them eligibility for additional training in the basic sciences at the college Opportunities for physicians already engaged in practice will also be possible through lectures, clinics, and demonstrations and other forms of such courses These are being planned by the medical board of the hospital

The medical board of Lenox Hill Hospital has created a committee on medical education to serve as the liaison between the college and the hospital in the establishment of the teaching program Quite a number of the members of the Lenox Hill staff are already members of the New York University College of Medicine faculty, and officials of both institutions predict that this number will be increased appreciably in the coming year

Necrology

James H Brennan, M D, of New Rochelle, died on November 26 at the age of 73 Dr Brennan received his medical degree from Long Island College of Medicine, in 1898, and served his internship at Bellevue and Fordham Hospitals He established his practice in New Rochelle in 1898 and retired nine years ago

Frank A Winship, M D , of Eagle Mills, died on December 3 at the age of 82 He was graduated from Albany Medical College in 1888, and was a member of the Rensselaer County Medical Society, the Medical Society of the State of New York, and the American Medical Association

---

"DOCTOR JONES" SAYS—

Mushrooms—you know they're quite interesting things, when you stop to think of it The way a mushroom'll grow up overnight and shrivel up almost as quickly—a business concern or something that has rapid growth but don't last long, we call it a "mushroom growth" And mushrooms they can be beautiful and, if they're the right kind, they're highly desirable but if they aren't we'd better keep away from 'em Yes, they're more or less like some—but I guess maybe we'd better not carry our analogies too far

At any rate mushrooms are the fruits of fungus plants There's hundreds of varieties, a lot of 'em edible and a comparatively few that're poisonous in various degrees There's several varieties of a species they call Amanita phalloides (one of 'em they call it "The Destroying Angel"), it's these that're responsible for most of the fatal cases of poisoning Upwards of 40 per cent of the poisonings with this species are fatal There's other poisonous varieties where they're liable to be pretty sick but don't usually die

The botanists, so I was reading—people are always asking 'em how to tell mushrooms from toadstools Well, the answer is they're all mushrooms I s'pose any of 'em that, if you've got a good imagination, look as if a toad might sit on 'em, you can call 'em "toadstools" if you want to A lot of people, though, when they speak of toadstools they're thinking of the poisonous ones

Taking mushrooms generally, according to the best authorities, there's no "rule" you can apply to tell which are edible and which are poisonous To be safe picking wild ones you've got to know the various kinds so well that, as one fellow expresses it, you can recognize 'em as easily as you can the members of your own family

But anybody that likes that delicate mushroom flavor (and I don't know why I do because it always reminded me of the way a soapy dishrag smells) if he's interested and got ordinary intelligence, having to get well acquainted with 'em is no great obstacle And even people—you have to know 'em pretty well before you can be sure of keeping away from the occasional poisonous ones —*Paul B Brooks, M D , in Health News, July 9, 1945*

IN WHOOPING COUGH

ELIXIR BROMAURATE IS A UNIQUE REMEDY OF UNIQUE MERIT

Cuts short the period of the illness and relieves the distressing cough. Also valuable in BRONCHITIS and BRONCHIAL ASTHMA. In four-ounce original bottles. A teaspoonful every 3 or 4 hours (Contains one-half grain Gold Tribromide in one fluidounce. Alcohol 2½% by volume.)

GOLD PHARMACAL CO., New York

While I am not an otolaryngologist, I encountered the following case of deafness in my general practice, which I treated with a solution of benzyl cinnamate (Jacobson's solution)

A woman, 35 years of age, married, with two children, 11 and 7½ years old, came to me complaining of deafness in the right ear She could not enjoy movies, stage shows, or radio, and when talking on the telephone "mixed sounds" were all she could hear At infancy, the patient claims, she had an upper respiratory infection complicated by otitis media purulenta The local lesion cleared up, with resultant deafness, which she had up until the time she came to see me The patient was also subject to hay fever, rose fever, and dust and food allergies There was no complaint of tinnitus or vertigo

On August 29, 1945, a first series of twelve injections, beginning with 0 3 cc of solution of benzyl cinnamate (Jacobson's solution), was started and gradually increased to 1 cc By the time she received the third injection, the patient complained of a "drawing feeling" On September 21 the patient had a slight discharge from the right ear which cleared up No improvement in hearing was noted at this time A second series of injections was started on September 24, and after the seventh injection hearing improved slightly The hearing then began to improve gradually and the patient stated she could hear with ease at the theater and over the telephone A third series was started on October 18 and completed on October 29, at which time the patient expressed delight at hearing "perfectly"

Because this case of deafness, present for over thirty years, was so improved in a short time with this simple treatment with Jacobson's solution, I feel that this observation merits publication

Washington 25, D C

Medical Society of the State of New York
292 Madison Avenue
New York 17, New York

Gentlemen

This will acknowledge receipt of yours of October 31 with the Resolution on Restoration of Prewar Medical Educational and Intern System, and Resolution on Early Release of Doctors from Armed Services

Concerning the Restoration of Prewar Medical Educational and Intern System we may advise you that the Selective Service System has no further interest in the acceleration program of medical education Bona fide medical students actually pursuing a course in medicine are subject to consideration for deferment, and this deferment may extend over a normal period of vacation The intern who has completed his medical education may be given consideration for deferment when it is established that he is performing an essential service to the national health, safety, or interest

The release of doctors from the armed services is a matter which is not within the province of the Selective Service System

Sincerely yours,

CARLTON S DARGUSCH, Colonel, J A G D,
Deputy Director

Bureau of Medicine and Surgery
Navy Department
Washington 25, D C

W P Anderton, M D , Secretary
Medical Society of the State of New York
292 Madison Avenue
New York 17, New York

Dear Doctor Anderton

I wish to acknowledge receipt of your letter of October 31, with enclosure (Resolution adopted by the Medical Society of the State of New York)

With reference to the release of medical officers from the Navy, I wish to submit the following information

The demobilization program promulgated by the Navy Department established the point score at sixty (60) points for Reserve medical officers for release from active duty This did not include personnel classified as essential teachers, hardship cases, or medical officers released due to medical disabilities and essential to local communities There were nine hundred and fifty-five (955) Reserve medical officers eligible for release whose point score was in excess of sixty (60) points On 10 October, 1945, the Navy Department reduced the point score for Reserve medical officers to fifty-three (53) points Through this reduction, four thousand (4,000) Reserve medical officers were eligible for release, effective 1 November, 1945 In other words, four thousand (4,000) Reserve medical officers comprise approximately thirty-three per cent of all medical officers serving on active duty The Navy Department recently issued a directive lowering the point score for Reserve medical officers to fifty-one (51) points, effective 1 January, 1946 This will include accumulative total of over five thousand five hundred (5,500) Reserve medical officers eligible for release on the point-score formula

During the war, and present National Emergency, the Medical Department has experienced a great shortage of medical officers With the advent of V-J Day, there was a shortage of over three thousand (3,000) medical officers, and it was necessary to assign in excess of eight hundred (800) medical officers to separation centers for duty in connection with the examinations and procedures pertaining to the separation of Naval and Marine Corps personnel under the demobilization program

You may be assured the Navy Department will make every effort to accomplish the release to inactive duty of all Reserve medical officers at the earliest possible date consistent with providing adequate medical attention to personnel of the Navy, Marine Corps, and Coast Guard

With kind regards,

Very sincerely,

ROSS T MCINTIRE, Vice Admiral (MC)
Surgeon General, U S Navy

SUGGESTIONS FOR CONTRIBUTORS TO THE *NEW YORK STATE JOURNAL OF MEDICINE*

The NEW YORK STATE JOURNAL OF MEDICINE asks its contributors to follow the suggestions listed below in the preparation of their articles In this way they will greatly facilitate the expeditious publication of the JOURNAL. These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles.—It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside. Longer articles tend to lower reader interest. An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e.g., twelve manuscript pages will make five JOURNAL pages

Manuscripts.—Papers must be typewritten on one side only of white sheets consecutively numbered, and be *double spaced* with one-inch margins. They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin This is imperative for rapid and accurate composition by the printers

Titles.—The title should be *brief* and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters. Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives. Directly under his name should be the hospital or institution with which he is affiliated

Subheadings.—Subheadings should be inserted by the author at appropriate intervals.

References.—It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text.) The arrangement should be as follows and should include all items.

a. *Books*—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus Osler, W Modern Medicine, 3rd ed., Philadelphia, Lea & Febiger, 1927, vol. 5, p. 57

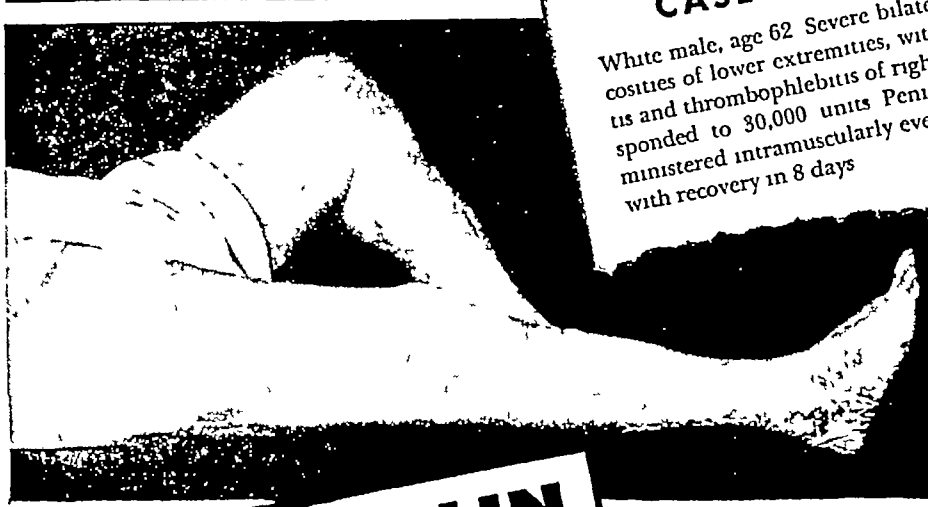
b *Periodicals*—author's surname followed by initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med. 40 347 (March 1) 1940

NOTE The JOURNAL does not include titles of articles

Case Reports.—Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences. All unimportant details should be deleted with such general negative statements as fit the case.

Tables.—While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be reduced as much as possible to descriptive language.

Illustrations.—These should be kept to the minimum necessary to make clear the points to be registered by the author In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the not inconsiderable cost.



When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper *Do not use typewriter for lettering* The smallest lettering on 8 × 10 inch copy should be no less than 1/8 inch high. Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions. In the case of finely ruled paper, only blue-lined paper can be accepted. Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold. Photographs should be very distinct and show clear black and white contrasts. They must be on glossy white paper Avoid round and oval photographs.

Whenever possible "crop" photographs, i.e., mark portion that can be excluded when reproduced. Crop marks should be on *margin* of photographs *Do not run pencil lines through photographs*

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig. 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

CASE HISTORY

White male, age 62 Severe bilateral vari cosities of lower extremities, with cellulı tis and thrombophlebitis of right leg Re- sponded to 30,000 units Penicillin, ad ministered intramuscularly every 3 hours with recovery in 8 days

PENICILLIN in CELLULITIS

Serious local infections such as cellulitis due to hemolytic streptococcic infections—with or without bacteremia—respond rapidly and dramatically to Penicillin

Initial dosage of 15,000 to 20,000 units is advised. Constant intravenous injection of an isotonic sodium chloride solution follows, allowing administration of 5,000 to 10,000 units every hour, or 120,000 to 240,000 units in a twenty four hour period. If this method is found inadvisable, 20,000 to 40,000 units may be injected intramuscularly every three or four hours.*

Bristol Penicillin, because of its low toxicity and freedom from pyrogens, its absolute sterility and standard potency, provides dependable therapeutic action.

For additional current literature on the clinical uses of this potent antibiotic, refer to your issues of the BRISTOL PENICILLIN DIGEST

*Keefer C. S et al., New Dosage Forms of Penicillin, J.A.M.A. 128: 1161 (Aug. 18) 1945

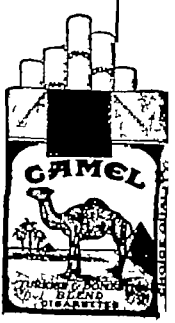
More pleasure to you, Doctor!

THREE nationally known research organizations recently reported the results of a nationwide survey to discover the cigarette preferences of physicians and surgeons

Physicians all over the United States were asked the simple question "What cigarette do you smoke, Doctor?" The question was put solely on the basis of *personal preference as a smoker*

The thousands and thousands of answers from these physicians in every branch of medicine were checked and re-checked The result

> **More physicians named Camel as their favorite smoke than any other cigarette. And the margin for Camels was most convincing**



Certainly the average physician is busier today than ever before and is deserving of every bit of relaxation he can find in his day by-day routine a cigarette now and then if he likes And the makers of Camels are glad to know that physicians find in Camels that extra margin of smoking pleasure that has made Camels such a favorite everywhere.

According to this recent nationwide survey

More Doctors Smoke Camels

than any other cigarette

Schieffelin
BENZESTROL
(2, 4-di (p-hydroxyphenyl)-3-ethyl hexane)

Clinicians agree that Schieffelin BENZESTROL is a significant contribution to therapy in that it is both estrogenically effective and singularly well tolerated, whether administered orally or parenterally.

"In our hands it has proved to be an effective estrogen when administered either orally or parenterally and much less toxic than diethylstil bestrol at the therapeutic levels" (Taliman, M R —Am. Jour Obstet. & Gynec 46, 534, 1943)

"During the last two years I have used the new synthetic estrogen Benzestrol in patients in whom estrogenic therapy was indicated The results have been uniformly satisfactory" (Jaeger, A. S Journal Indiana State Med. Assn 37, 117, 1944)

Schieffelin BENZESTROL is indicated in all conditions for which estrogen therapy is ordinarily recommended and is available in tablets of 0.5, 1 0, 2 0 and 5 0 mg , in solution in 10 cc. vials, 5 mg per cc , and vaginal tablets of 0.5 mg strength.

Vasano

FOR TRAVEL SICKNESS

Investigators in the medical corps of the United States Navy, the British Royal Navy, the air forces and elsewhere have demonstrated that hyoscine (scopolamine), whose effects are afforded by VASANO, is the best single agent for the treatment of all forms of travel sickness [1-4]

VASANO, Schering's hyoscine and hyoscyamine preparation, brings to civilian practice the proved benefits of this war time therapeutic advance.

Consistently most effective for seasickness as well as a "potent preventive of airsickness" hyoscine causes no harmful side effects in recommended dosage.

Adult Dose: Two tablets or one suppository 1 to 2 hours before departure, repeated in 3 to 4 hours if necessary. A total of four tablets in 24 hours should not be exceeded. VASANO Tablets are supplied 12 to a box; Suppositories 10 to a box

In Estrogenic Therapy TOLERANCE

One of the important advantages of "Premarin" lies in the fact that it is exceptionally well tolerated. Although highly potent "Premarin" rarely produces unpleasant side effects—a statement which finds ample corroboration in the extensive bibliography In "Premarin" the physician will find a medium for estrogenic therapy which is noted for its therapeutic effectiveness. "Premarin" is derived exclusively from natural sources and its administration is usually followed by what is invariably described by the patient as a general feeling of well being.

ESSENTIALLY SAFE HIGHLY POTENT ORALLY ACTIVE
NATURALLY OCCURRING WATER SOLUBLE
WELL TOLERATED IMPARTS A FEELING OF WELL-BEING

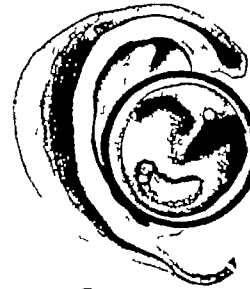
Medications of Choice FOR THE SPECIFIC INVOLVEMENT

Auralgan

in ACUTE OTITIS MEDIA

Symptoms

Pain, fever edema, leucocytosis sense of fullness and impaired hearing



Treatment

Relief of pain and inflammation—*Auralgan.*

Action

Decongestant, analgesic, bacteriostatic.

Scientific data and reprints of clinical studies reporting upon the use of Otosmosan available on request.

Otosmosan

in CHRONIC SUPPURATIVE OTITIS MEDIA

Symptoms

Persistent discharge, often foul smelling, usually no toxemia, no pain, no fever

Treatment

Otosmosan.

Formula

SULFATHIAZOLE 10% - UREA 10% - In GLYCEROL (DOHO)

Action

Deodorizes the discharge, liquifies unhealthy granulations, bacteriostatic, permits normal epithelial ization.

Complimentary quantities for clinical trial

All the Factors Involved in Raising the Hemoglobin Level

IN secondary anemia, administration of iron alone rarely proves sufficient to promote rapid hemoglobin restoration Clinical experience has shown that the efficacy of anemia therapy is measurably improved by supplying B vitamins in adequate amounts, in addition to highly available iron

Livitamin presents B-VITAMIN *FACTORS naturally occurring in fresh* liver concentrate and rice bran, fortified with synthetic thiamine, riboflavin, niacinamide, pyridoxine, and pantothenic acid, IRON in highly available colloidal form, virtually free from untoward influence upon the gastrointestinal tract; FRESH LIVER (as liver concentrate), containing the liver-fraction in which the recognized anti-anemia principle is found

When blood loss or destruction is excessive (hemorrhage, severe infections, etc), when there is an increased demand upon blood-forming organs as in pregnancy, or when nutritional deficiencies result in hypochromic anemia, Livitamin supplies effective therapy directed against the various mechanisms involved in the anemia syndrome

Livitamin (a highly palatable liquid) is supplied in 8-oz bottles

A Fundamental Approach
TO SULFUR METABOLISM

HYDROSULPHOSOL

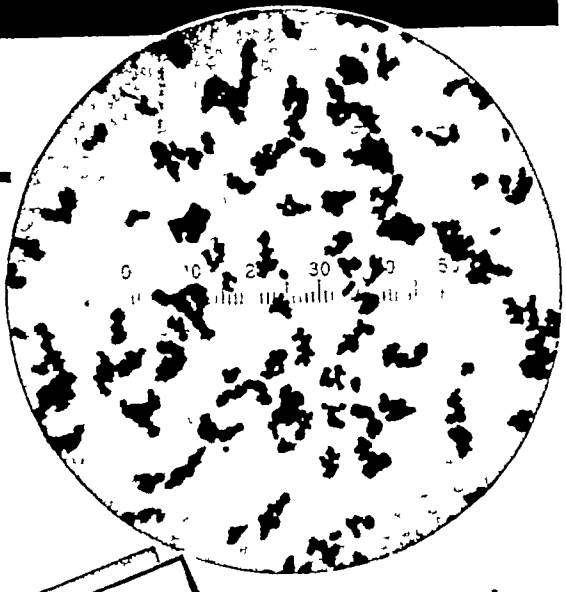

Illustration showing flowers of sulfur magnified 82X small divisions = 10 microns The size of the colloidal sulfur particle in Hydrosulphosol is estimated at 1/1000 of a micron or 1/10,000 of the small division particle illustrated

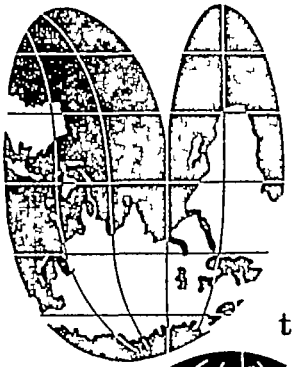

A true solution of sulfur bearing compounds resulting solely from the reduction of flowers of sulfur by a catalytic process In aqueous solution, it is capable of releasing its unusually high concentration of sulfhydryl ion in readily utilizable form . . without evidence of toxic reaction

Its therapeutic importance may best be evaluated by the fact that the —SH radical of the cysteine forms the active group in glutathione, alone of reported importance in connection with tissue oxidations

Hydrosulphosol is indicated in the management of burns, ulcers and pathological conditions in which sulfur metabolism is a clinical consideration

Reprints of scientific papers by authoritative investigators available on request

IN THE MANAGEMENT OF ARTHRITIC PATIENTS

In the 1943 edition of *Nutrition and Diet in Health and Disease*, McLester emphasizes the importance of large amounts of all the essential vitamins in the treatment of chronic rheumatoid arthritis. He states that "Vitamins in abundance should be provided"

*"Vitamins in abundance should be provided"

Most rheumatologists recognize this need for all the vitamins, in addition to any specific requirement, in the management of the arthritides Clinical investigations emphasize the systemic nature of chronic arthritis and reveal that better results were obtained when in addition to massive doses of vitamin D adequate amounts of the other vitamins were administered.

For the physician's convenience in prescribing these vitamins, and to assure greater patient cooperation, Darthronol supplies in one capsule adequate amounts of all the known essential vitamins in addition to 50,000 U S P units of vitamin D

Each Capsule Contains

Vitamin D (Irradiated Ergosterol)	50,000 U.S.P. Units
Vitamin A (Fish-Liver Oil)	5 000 U.S.P. Units
Ascorbic Acid	75 mg
Thiamine Hydrochloride	3 mg
Riboflavin	2 mg
Pyridoxine Hydrochloride	0.3 mg
Calcium Pantothenate	1 mg.
Niacinamide	15 mg.
Mixed Natural Tocopherols (Equivalent in biological activity to 3 mg of Alpha Tocopherol)	3.4 mg

THESODATE Brewer's

The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE

to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES *and to prevent* EDEMA

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

EFFECTIVE LOCAL ANALGESIA
for the sore, irritated throat

In the management of sore, irritated throat in children, *effectiveness* in providing prolonged topical analgesia at the site of irritation, plus *ready acceptance*, are most advantageously joined in—

Dillard's Aspergum

Obviously resistance is negligible when children are given an agreeably flavored tablet of gum to chew

When Aspergum is chewed a copious flow of acetylsalicylic acid laden saliva is brought into immediate and prolonged contact with all pharyngeal areas including those seldom reached, even intermittently, by sprays or irrigations.

The rhythmic stimulation of muscular action helps greatly to relieve local spasticity and stiffness.

Supplied in packages of 16 moisture proof bottles of 36 and 250 tablets

Ethically promoted—not advertised to the laity White Laboratories, Inc., Pharmaceutical Manufacturers, Newark 7 N J

ON THE *Nutrients Contained* IN CANDIES

Theoretically speaking, any food which contributes in some measure, to the satisfaction of all nutritional requirements, fills a worthwhile place in the human dietary Many candies —in fact the majority of the kinds and types of candy consumed in the United States — fall into this category.

In the manufacture of many types of candies milk, butter, eggs, fruits, nuts, and peanuts are quantitatively important ingredients,* contributing their contained nutrients to the finished confections To this extent therefore, they provide biologically adequate protein, valuable fat, quickly available carbohydrate, B-complex vitamins, and essential minerals

The amounts of these nutrients contributed by candies compare favorably with those contained in weight-equivalent quantities of many commonly eaten desserts Hence candies, eaten in reasonable amounts, as desserts and as between-meal snacks (especially when quick replenishment of expended energy appears advantageous), merit recognition as a desirable food in the daily diet

*In 1943 the candy industry used 125,000 tons of nuts and peanuts 10 000 000 pounds of fruits, 6,000,000 pounds of eggs 400 000,000 pounds of dairy products, as well as 400,000,000 pounds of chocolate products.

THE NUTRITIONAL PLATFORM OF CANDY

1 Candies in general supply high caloric value in small bulk.

2. Sugar supplied by candy requires little digestive effort to yield available energy

3 Those candies, in the manufacture of which milk, butter, eggs, fruits, nuts, or peanuts are used, *to this extent* also—

a) provide biologically adequate proteins and fats rich in the unsaturated fatty acids;

b) present appreciable amounts of the important minerals calcium, phosphorus, and iron,

c) contribute the niacin, and the small amounts of thiamine and riboflavin, contained in these ingredients.

4 Candies are of high satiety value, eaten after meals, they contribute to the sense of satisfaction and well being a meal should bring, eaten in moderation between meals, they stave off hunger

5 Candy is more than a mere source of nutriment — it is a morale builder, a contribution to the joy of living

6 Candy is unique among all foods in that it shows relatively less tendency to undergo spoilage, chemical or bacterial.

For the Uphill Haul

The correction of chronic constipation is an uphill haul which succeeds only when patients *willingly* stay with the prescribed regime They are more likely to stay with Mucilose—a highly purified concentrated source of intestinal bulk. Doses are accordingly smaller* easier to take more economical and more measurably effective

*Tests of leading psyllium-type preparations show that Mucilose produces five times more bulk per gram than the average of the others. (Gray H., and Talaiter, M. L.: Am. J. Digest. Dis. 8:186, 1941.)

Mucilose

Highly Purified Hemicellulose

FOR INTESTINAL BULK

MUCILOSE is a highly purified hemicellulose of Plantago leaflament. Hydrophylic it absorbs approximately 50 times its weight of water to form a bland lubricating bulk which gently stimulates peristalsis. Hypoallergenic—free from irritants—nondigestible—nonabsorbable.

INDICATED in the treatment of both spastic and atonic constipation, and as an adjunct to dietary measures for the control of constipation in aged, convalescent and pregnant patients those with hemorrhoids, and with erratic dietary habits.

DOSAGE: One or two teaspoonfuls once or twice daily along with ample liquids to insure maximum bulk formation. *Unflavored*—Mucilose mixes well with any fluid ..weet or salty to suit any taste. Placed on the tongue and washed down with water or eaten along with other foods, Mucilose—because it contains no diluents—has no flavor to be disguised.

SUPPLIED in 4 oz. bottles and 16 oz. containers. Also available as Mucilose Granules—a dosage form which is preferred by some patients.

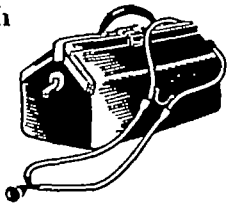
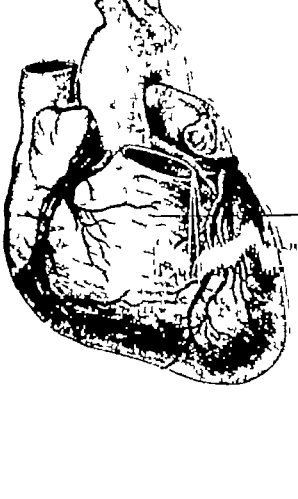
ARMOR AND ARMAMENTARIUM



Guns are silent and grass grows in the foxholes, but there can be no peace treaty in the endless war on mankind's immortal enemy—Disease Home comes the physician from his lifesaving on the battlefields of man-made death abroad to march again beside his colleagues who have so valiantly held the casemates of health at home



Battle front and home front, boulevard and dirt road, the mighty facilities of the medical center and the challenge of practice in the lonely farmhouse—all are the front line trenches in humanity's continuing crusade to tame cannibal protoplasm There is no discharge in that war

The first cry of pain in the world was the first call for a physician It has been answered as it echoed down the centuries, it will be answered in the unrolling years of the future.

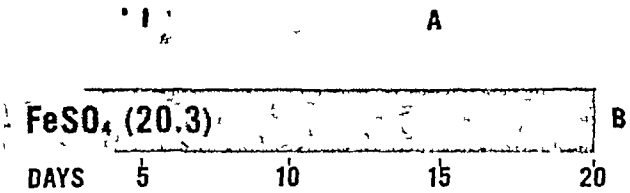
As this questioning year of 1946 opens with the world convalescing from malignant political disease, we would like to claim the privilege of welcoming the thousands of physicians returning from unparalleled service on war fronts—of saluting those who shouldered such heavy burdens at home—of expressing the confidence that the traditional unity of the profession armed with new and potent weapons will drive the front lines of the war on disease ever forward

We know that we are joined in this expression by all organizations which seek to play their roles, large and humble, as institutions of supply to those "bound by the covenant and oath, according to the law of medicine." S H CAMP AND COMPANY, Jackson, Mich

reduce the load

More efficient heart muscle function is permitted when the cardiac burden of the decompensated heart is decreased. The promotion of diuresis is an important factor in breaking the vicious circle of congestion, edema and the resultant increased circulatory resistance

AMINOPHYLLIN (Searle) produces a gratifying increase in glomerular filtration without appreciable increase in tubular reabsorption In appropriate dosage, its therapeutic action is equally effective whether given orally or parenterally This permits the administration of Aminophyllin (Searle) both in acute emergencies and in chronic congestive heart failure

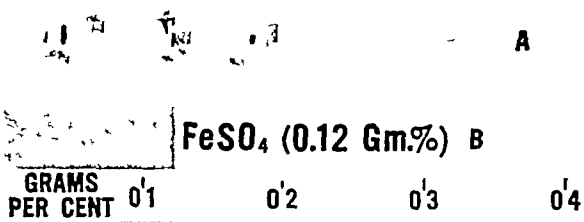


Aminophyllin (Searle) contains at least 80% anhydrous theophyllin G D Searle & Co , Chicago 80, Illinois.

SEARLE

RESEARCH IN THE SERVICE OF MEDICINE

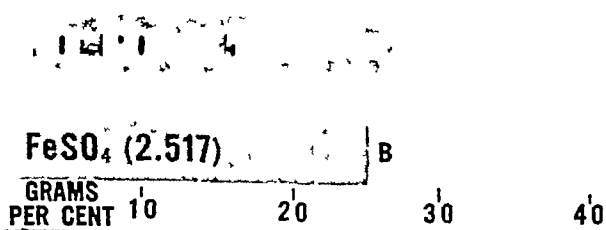
A NEW AND DEFINITE ADVANCE



RAPIDITY OF CLINICAL RESPONSE (Days)

(A) Completely effective therapeutic (return to normal blood values) was obtained in an average of 13.7 days of Mol Iron therapy

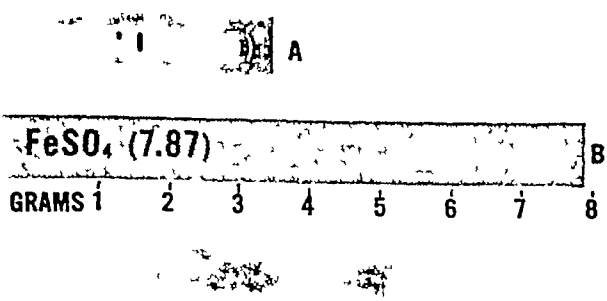
(B) Ferrous sulfate therapy failed to produce normal hemoglobin values after an average of 20 3 days.



AVERAGE DAILY HEMOGLOBIN INCREASE (Gm. Per Cent)

(A) The group treated with Mol Iron averaged a daily hemoglobin increase of 24 per cent (0 36 Gm. per cent)

(B) The group treated with ferrous sulfate showed an average daily gain of hemoglobin of 0 83 per cent (0 12 Gm per cent)—a response about one-third as effective.



TOTAL HEMOGLOBIN INCREASE (Gm. Per Cent)

(A) The total hemoglobin increase (in age of 13 7 days) averaged 31 per Gm per cent) in the Mol-Iron treated

(B) A mean gain of only 17 per cent (" per cent) hemoglobin resulted in an period of 20 3 days during which rous sulfate treated group was

THERAPEUTIC INTAKE OF BIVALENT IRON (Gm.)

(A) The Mol-Iron treated group re average total of 3 528 Gms. of to produce the sought for result normal blood values)

(B) While an average ingestion of 7 of bivalent iron failed to achieve an response in the ferrous sulfate treated

in Treating Iron-Deficiency Anemias

A specially processed, co precipitated complex of molybdenum oxide (3 mg) and ferrous sulfate (195 mg)

White's MOL-IRON TABLETS

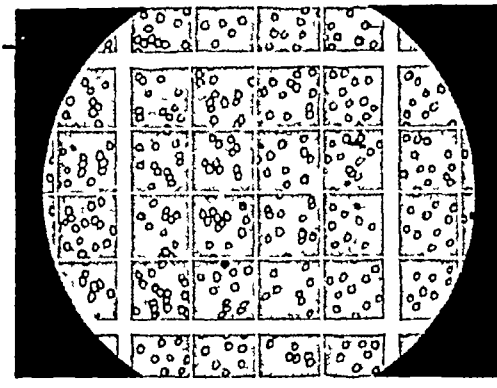
Available clinical evidence indicates that, in hypochromic anemia, the therapeutic response to this highly effective synergistic combination—as compared with equivalent dosage of ferrous sulfate alone—has unusual advantages

1 NORMAL HEMOGLOBIN VALUES ARE RESTORED MORE RAPIDLY, INCREASES IN THE RATE OF HEMOGLOBIN FORMATION BEING AS GREAT AS 100% OR MORE IN PATIENTS STUDIED

2. IRON UTILIZATION IS SIMILARLY MORE COMPLETE

3 GASTRO INTESTINAL TOLERANCE IS NOTABLY SATISFACTORY—even among patients who have previously shown marked gastro intestinal reactions following oral administration of other iron preparations.

INDICATED IN: Hypochromic (iron-deficiency) anemias caus by inadequate dietary intake or impaired intestinal absorpti of iron, excessive utilization of iron, as in pregnancy and lact tion, chronic hemorrhage



DOSAGE One or two tablets three times daily after meals

Available in bottles of 100 and 1000 tablets Ethically pr moted—not advertised to the laity

PHARMACEUTICAL White LABORATORIES, INC. MANUFACTURERS

Number 3 of a Series

IN ANEMIA OF CHRONIC BLOOD LOSS

In the management of chronic blood loss, therapy designed to support red cell and hemoglobin formation is essential Iron must be supplied to correct hypochromia, liver and the B vitamins bolster an overworked bone marrow in the production of red cells. The combination is more effective than iron alone.

HEPATINIC

presents iron in readily assimilable ferrous form, together with Crude (Unfractionated) Liver Concentrate and Vitamin B Complex

Crude (Unfractionated) Liver Concentrate is prepared so that it retains the erythropoietic and nutritional principles of whole liver, which are lost in the highly refined concentrates Furthermore, it is subjected to enzymatic digestion to provide maximum assimilation and prompt therapeutic response

The appealing and palatable taste of Hepatinic assures patient acceptance and particularly recommends the product for pediatrics

FORMULA: Each fluidounce Elixir Hepatinic contains

Ferrous Sulfate 12 gr , Crude (Unfractionated) Liver Concentrate (equivalent to 660 gr fresh liver) 60 gr Thiamine Hydrochloride 2 mg , Riboflavin 4 mg., Niacinamide 20 mg , together with pyridoxine, pantothenic acid, choline, folic acid, vitamin B_{10}, vitamin B_{11}, biotin, inositol, para amino-benzoic acid, and other factors of the vitamin B complex.

BUFFALO 2, N. Y.

No food (except breast milk) is more highly regarded than Similac for feeding the very young, small twins, prematures, or infants who have suffered a digestive upset. Similac is satisfactory in these special cases simply because it *resembles breast milk so closely*, and normal babies thrive on it for the same reason. This similarity to breast milk is definitely desirable—*from birth until weaning.*

A powdered modified milk product especially prepared for infant feeding made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and cod liver oil concentrate

One level tablespoon of Similac powder added to *two* ounces of water makes *two* fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

TO "Streamline" CREOSOTE THERAPY

Rx Calcreose

PALATABLE • WELL TOLERATED • THERAPEUTICALLY EFFECTIVE

The development of CALCREOSE (Maltbie) has, in deed, "smoothed the rough spots" in creosote therapy so frequently provocative heretofore of nausea and distress • Moreover, CALCREOSE (calcium creosotate) exerts bactericidal and bacteriostatic action up to *three times as great* as that of creosote • Thus, in providing all the well known benefits of creosote in a *pleasant* and *palatable* form, CALCREOSE proves highly effective in many bronchial and respiratory affections lessening cough, diminishing expectoration, reducing its purulency and deodorizing sputum. Also it tends to stimulate the appetite and improve the patient's general condition

AVAILABLE: As tablets (4 gr.) in bottles of 100, 500 and 1000 COMPOUND SYRUP CALCREOSE in pint or gallon bottles.

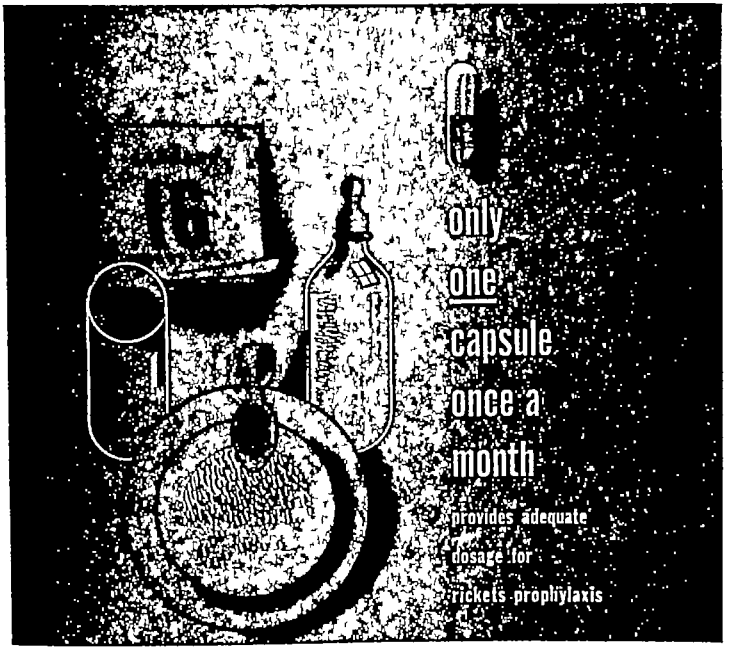
The Preference is Overwhelming

A comprehensive report published in *Human Fertility*[1] shows an overwhelming preference by experienced clinicians for the "Diaphragm and Jelly" method of conception control.

The report covering 36,955 new cases shows that the diaphragm and jelly method was prescribed for 34,314, or 93%.

On the evidence supplied by competent clinicians we continue to suggest that for the optimum in protection the physician should prescribe the combined use of a vaginal diaphragm and spermatocidal jelly



When you specify "RAMSES"* a product of highest quality is assured.

UNICAP VITAMINS

FINE PHARMACEUTICALS SINCE 1886 • FIGHT INFANTILE PARALYSIS — JANUARY 14 31

Before Copperin appeared, massive iron doses were inflicted on the anemic Most of the iron was not utilized The excess, excreted fecally, produced gastrointestinal irritation and upset—thus defeating the original purpose of the clinician

Copperin represents a scientific conception of iron needs in secondary anemia The iron content per capsule is small — 32 mgm — but wholly adequate The potent catalytic agent, copper sulphate, makes ALL the iron available for regenerative processes.

There is rapid replacement of hemoglobin and new red cells This is markedly manifested in treating the hypochromic anemia of children, the "milk anemia" of infants, hemorrhagic anemia following blood donation; pregnancy anemia, chlorosis and anemia of middle aged women.

In two strengths Copperin "A" for adults, Copperin "B" for children

Specific Action

TO PROMOTE FAT DIGESTION

When fat digestion is impaired due to deficient bile secretion, and when fatty foods prove intolerable in the absence of gallbladder involvement, Degalol—the original, chemically pure deoxycholic acid —offers noteworthy advantages.

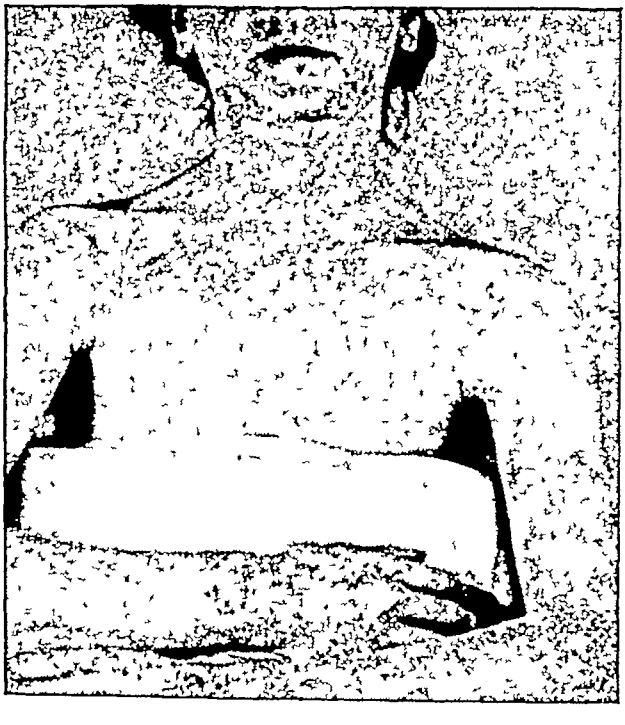
A constituent of human bile, it is the fraction chiefly concerned with fat emulsification, promoting the digestion and absorption of ingested food fats and the utilization of the fat-soluble vitamins.

In the dosage required, Degalol exerts little or no choleretic influence Thus it proves superior to ordinary bile salts which not only are less potent in their influence on fat emulsification, but—since they are required in higher dosage—produce side actions which are frequently undesirable The powerful choleretic influence of the bile salts, for instance, is definitely to be avoided in catarrhal jaundice, though fat digestion and vitamin absorption are to be enhanced.

DOSAGE

One or two 1½ gr tablets t. i. d. Supplied in boxes of 100 sanitaped 1½ gr tablets. Available on prescription thru all pharmacies

When fatty foods lead to postprandial distress and epigastric pain, Degalol frequently proves specific. In suspected or frank deficiency of fat-soluble vitamins D, E and K and carotene, the administration of Degalol together with the vitamins is indicated.



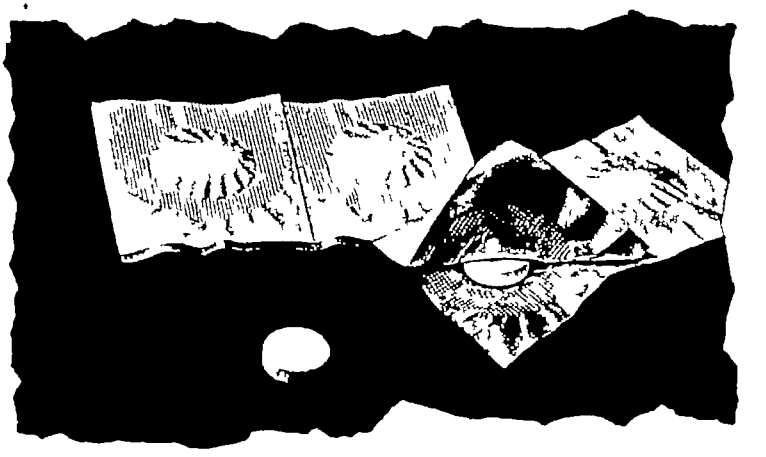
CHEMICALLY PURE DEOXYCHOLIC ACID

Riedel - de Haen, Inc. • New York 13, N. Y.

Atopic Eczema

IN MANY INSTANCES YIELDS

KNOWN also as neurodermatitis disseminata, atopic eczema is related to the hay fever-eczema-asthma syndrome Basically it consists of vascular hypersensitivity to a number of substances, the wide range of which makes therapy difficult Through the decongestant and stimulant properties of Tarbonis, atopic eczema responds in many instances Because of the beneficial action of its highly active tar, the local discomfort is mitigated and disappearance of the lesions is encouraged Elimination of the offending allergens, while usually difficult, should be attempted. Since Tarbonis is odorless, greaseless, and non-staining to clothes and skin, it may be employed continuously for a 24-hour application, thus assuring maximum therapeutic benefit



Tarbonis presents all the therapeutic advantages of crude coal tar with none of the drawbacks of the latter It is colorless, odorless, greaseless, does not stain linen or skin Tarbonis contains 5% Liquor Carbonis Detergens extracted from carefully selected tar by a unique process, retaining all beneficial factors of tar and eliminating the irritants Menthol and lanolin are also incorporated in the vanishing cream base, making for a preparation of unusual pharmaceutical elegance. Tarbonis is specifically indicated in eczema (including the infantile and atopic varieties), psoriasis, ringworm, occupational dermatoses, folliculitis, seborrheic dermatitis, intertrigo, pityriasis, varicose ulcers, contact dermatitis, lichen planus, ulcus hypostaticum.

ABOUT THESE CONVENIENT NEW FORMS OF PENICILLIN?

TABLETS PENICILLIN CALCIUM SQUIBB are individually and hermetically sealed in aluminum foil to prevent deterioration from moisture. Hence physicians can prescribe precisely the number needed without fear of potency loss. Penicillin destructive gastric juices are buffered by 0 5 gm of trisodium citrate in each tablet. Tablets Penicillin Calcium Squibb provide 20,000 units, making oral therapy feasible for many conditions which heretofore could be treated only by repeated parenteral injections.

Squibb also has available these new convenient forms of penicillin:

TOPICILLIN CHEWING TROCHES

20,000 units penicillin calcium in a flavored paraffin base, each troche individually wrapped Box of 6

TOPICILLIN OINTMENT

General purpose ointment containing 1,000 units penicillin calcium per gram in a base of petrolatum, anhydrous lanolin, beeswax and peanut oil. Tube of 14.5 Gm. (½ oz.)

TOPICILLIN OINTMENT OPHTHALMIC

1,000 units penicillin calcium per gram in a base similar to general purpose ointment, but with consistency adjusted to ophthalmic use. Tube of 3 6 Gm. (⅛ oz.)

DELACILLIN

Penicillin calcium in peanut oil with beeswax, 300,000 units per cc. 1-cc. and 10-cc. vials.

MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

IMPROVED CLEANSING

without HARSH SCRUBBING

in Acne Vulgaris

Better cleansing in acne vulgaris was successfully attained when Acidolate—replacement for soap—was used as the skin cleansing agent in over 400 acne vulgaris patients during a period of four years [1]

Acidolate, the original and only sulfated-oil detergent with a background of extensive clinical research, offers the following advantages as a skin cleanser in acne vulgaris —

1 Achieves thorough and better cleansing by gentle massage instead of harsh scrubbing.
2 Removes excess sebum as well as other fatty materials and loosens epithelial debris.
3 Seems to lessen formation of new comedones and facilitates removal of those that do form.
4 The acidity of Acidolate (pH 6 25) approximates that of normal skin and does not change the protective action of sweat
5 Renders the skin receptive to the action of prescribed therapeutic agents.
6 Insures the patient s cooperation because of early, favorable response to the "Acidolate Massage cleansing technique.
7 Contains no alkalis no irritating fatty acids of low molecular weight and no allergenic substances.
8 Water miscible, Acidolate rinses off readily with hot or cold, hard or soft water

Printed instruction sheets for use of Acidolate by acne vulgaris patients available to physicians on request.

Other indications *When soap is contraindicated,* as in dermatitis venenata, eczema, seborrhea, etc., when soap is *inadequate* as in removing residual ointments

Supplied in
8 oz. and gallon bottles

Whenever Vitamin C is indicated

prescribe

SODASCORBATE

In surgery, in convalescence, in pregnancy and lactation, in infectious diseases—in scores of clinical and pathologic states—vitamin C is being prescribed more widely every day

And every day, more and more physicians are avoiding certain of this vitamin's undesired side and after-effects—gastric irritation, acid shift and laxative action—by prescribing SODASCORBATE, the *improved* vitamin C therapy

SODASCORBATE (sodium ascorbate) corrects vitamin C deficiencies surely swiftly safely It has many advantages over ordinary ascorbic acid particularly where this therapy must be continued over long periods, or where massive doses of vitamin C are required

The average dose for adults and children over 12 years is one tablet three times daily, or as indicated by the condition. For children under 12 one-half tablet. This may be dissolved in milk for babies and young children

Supplied in bottles of 40 and 100 tablets as well as in "hospital-size bottle containing 500 tablets. For professional samples and covering literature, sign and mail the coupon.

"NEW HORIZONS IN VITAMIN C THERAPY"

Editorial

Promises

In a preceding issue of the JOURNAL we commented upon President Truman's recent message calling for a national health program as a part of an expanded Social Security project. Naturally, this is a matter for the people finally to decide, we hope on the merits of the proposal itself Security has to be paid for in one way or another, and the mere payment of the price does not guarantee either the quality of the product or its durability, nor the satisfaction of the customers with what they have purchased

As to the medical aspects of the program, about which it might seem doctors could speak with a degree of authority surely greater than most laymen and many politicians, the medical profession can act only in an advisory capacity to the public. And even in this capacity it can only lead the horse to water We can advise against socializing the medical profession, we can document that advice by numerous references to the experiences of other countries, all unsatisfactory, not perhaps by their standards but by ours, we can point out the benefits derived from private enterprise as against governmental control and management, we can show that "free" medical care is never free, that somebody pays for it in the end, but we cannot compel the public to listen to us

On the other hand, backed by the power of the public purse, there is little that the proponents of socialized medicine cannot promise Governor Saltonstall of Massachusetts, in a recent address at Town Hall, in New York, stated this very bluntly when he declared, "Don't have the Government make promises that it cannot live up to," and characterized the program as "a difficult one that has to be approached with care" Although measures of this kind have previously been before the public, it is questionable how much attention has been accorded them, especially by those groups which would be directly involved in the proposals No matter how these are presented by proponents of such measures, the general interpretation is that by their adoption, *free* medical care is to be given. The accessory devices relating to deductions from pay envelopes, to the red tape involved both for

patient and physician, to possible and very likely increased general taxation and to many other features, are not given sufficient thought in contrast to the glorious promises held out It is usually some time after the promises are made, after the voters have left the polls, that the citizen feels the cold hand of the government tax collector clutch his pocket, his business, his pay envelope, and enmesh his heirs and assigns forever

Promises are one thing, performance quite another Promises are the stock in trade of the politician and legitimately so, but in the case at least of the practice of medicine he can carry out his promises to the voters only by the *performance* of the doctors under the system he proposes It is difficult enough to guarantee one's own performance under most circumstances, to guarantee that of another person or of another group, even that of a profession governed by as rigid ethical principles as the doctors', would be no mean accomplishment True, it can be compelled by statute to a certain extent, as by the Public Welfare Law or the Workmen's Compensation Law, but in these instances there is more or less acceptance of the principle by the medical profession as a whole, and such systems are on a state level for the most part The recent experiences of New Zealand with its compulsory 'health' insurance and the thorny path being traveled in Great Britain by the doctors and the Labor Government are cases in point where national systems of medical care under governmental auspices are involved

For the information of our readers, we quote, *in extenso*, from a London correspondent,[1] since the question of the operation of a National Medical Service is now under discussion by the British Medical Association and the Labor Party

"The Labour Party has long been in favour of a National Medical Service, and some years ago it declared itself to be in favour of a whole-time salaried service Those in power are not fools and they realise the enormity of their present tasks in the rehabilitation and postwar reconstruction of Britain and the world They realise that without the good will of the majority of any affected group of the community their task is a hopeless one

"It is likely therefore—indeed the Minister of Health has said so—that the medical profession will be extensively consulted in regard to any scheme which is placed before Parliament, and so far as possible the profession's wishes will be met It seems likely that the first stage will be to provide free treatment for all in the following way Every person will be entitled to the services of a family physician of his or her choice. The family physicians, or, as we call them, the general practitioners, will be remunerated by a capitation fee for every patient on their list of patients But the government is also toying with another idea, the health centre. At a health centre a number of family physicians will be centred, and there will be such facilities as x-ray, special clinics, etc

"At such clinics or health centres the doctors will be remunerated by salary Thus there will be salaried and nonsalaried doctors competing with one another As regards hospitals, there are in this country voluntary and local authority or municipal hospitals It is likely that the Government will nationalise the municipal hospitals and enter into contract with the voluntary hospitals so that the latter are paid a certain sum for each service rendered to a patient treated on behalf of the State Later the voluntary hospitals may be taken over but not at first

"The public health services are at present maintained by local municipal authorities A form of regionalisation is visualised, and the administrative control of all medical services in the region will be vested in a regional committee On the regional committees and on the central committee the medical profession, the ancillary services, and the public (the patients) will be represented

"What is the profession's attitude towards all this? It is very difficult to determine When the late government issued its proposals the British Medical Association issued through the Institute of Public Opinion (Gallup Poll) a questionnaire This was sent to 53,728 doctors. 25,435 replies were received On the basis of these 39 per cent of the profession was favourable and 53 per cent unfavourable, the remainder being uncertain It is interesting to note that the figures from doctors in the services differed quite markedly from the general view Thus the figures show that doctors in the services were 53 per cent in favour and 41 per cent against. What effect would a national medical service have on doctors?

"In general, one can say that it would make the life of the junior less precarious and the life, or rather the latter part of the life, of the senior less remunerative That applies equally to specialists and general practitioners

"Until the present government announces its

[1] Letter of October 18, 1945

scheme including its financial terms, it is impossible to make any further statement The most important things are (1) How is the service to be administered, (2) What are the financial terms, (3) What prospects will there be for individual initiative and advancement?

"The profession is fully determined that, so far as possible, bureaucracy and politics, whether local or national, shall be kept out of the service, and that the profession shall be adequately represented in the management of the service"

According to a recent article in the *American Magazine*[1] for January, 1946, President Truman's recommendation that Congress establish a system of compulsory health insurance under the social security setup is supported by 60 per cent of a group of physicians and experts in public health work polled by the *American Magazine*

Ninety-nine per cent of the experts polled believe that the American people should be protected by some form of health insurance, but 40 per cent feel that the insurance should be private and voluntary rather than compulsory and under government operation Of the men and women authorities polled, more than half of them were physicians, some in private practice, others in public health work, in hospitals, universities, industries, and group health systems.

While the social and economic authorities (those without M D 's) favored compulsory insurance 75 to 25 per cent, the experts who are physicians divided almost exactly 50–50, according to the magazine

The majority of the experts believe that at least 40 per cent of the American people are receiving inadequate medical service and five out of six would have insurance payments cover both doctor and hospital costs "Even the other one sixth go beyond hospital service alone," says the magazine "They would include doctors' services of especially high cost, such as surgical costs"

In line with President Truman's recommendation, nine out of ten experts would let patients decide for themselves what physicians they would go to

Those favoring compulsory insurance under government operation argue that it will provide medical care to all at a price they can afford, it will spread the cost so widely that it won't be overloaded with people of very low incomes or by those who are poor health risks, and that the quality of service will be more uniformly maintained, since minimum standards will be established and supervised on a nation-wide basis Moreover, they think such a plan "will provide an efficient system which combines the care of insured persons with broad tax-supported services and programs for preventing disease

Those supporting a voluntary system contend that it will provide higher quality service and encourage medical progress They argue that government administration will be incompetent, inefficient, bureaucratic, will be run "politically" and "regiment" doctors and patients, will limit the initiative of doctors, and generally stifle medical progress and lower the standards of medical care

Among those polled were A J Altmeyer, chairman of the Social Security Board, Reginald M Atwater, Executive Secretary, American Public Health Association, A. C Bachmeyer, director of clinics, University of Chicago, Dean A. Clark, medical director, Health Insurance Plan of Greater New York, Morris Fishbein, editor, the *Journal of the American Medical Association*, S R. Garfield, medical director, Permanente Foundation Hospital, Oakland, California, Frederick D Mott, chief medical officer, Farm Security Administration, Louis S Reed, U S Public Health Service, Richard H Shryock, University of Pennsylvania, Harvey B Stone, private medical practice, Baltimore, Senators James E Murray, Montana, and Robert F Wagner, New York, and Franz Goldman, Yale University In Chicago on December 2, 1945[2]

"The first annual conference of presidents and other officers of state medical societies, to which delegates from all forty-eight states were invited, adopted a resolution calling for state-wide health programs 'based on the free choice of purveyors of health care' and urged also that a secretary of public health and medical welfare be added to President Truman's Cabinet

"Dr Philip K. Gilman, of San Anselmo, California, president of the California Medical Association, condemned President Truman's

[1] News Release of December 3 1945. Results of a poll of experts conducted by Dr Arthur Kornhauser of the Bureau of Applied Social Research Columbia University

[2] Herald Tribune, Dec. 3 1945.

proposed national system of health insurance as compulsory and 'bureaucratic'

"'We find our profession attacked on a broad front by politicians under the leadership of the highest elected official of our country, the President,' Dr Gilman declared

"Dr Joseph H. Howard, of Bridgeport, Connecticut, president of the Connecticut State Medical Society, also said President Truman's bill 'is socialized medicine' and asserted the measure's provision for 'free choice of physicians' includes 'only those physicians who are participating in the program'

"Arthur J Altmeyer, of Washington, chairman of the Social Security Board, defending President Truman's program, told the physicians that 'the medical profession cannot achieve the objective without the help of the government'"

New York Medicine,[4] commenting on the President's Health Program, says

"None of these proposals is strictly new The hospital and health center construction program for example, is already before Congress in the "Hill-Burton Bill" and is supported by both the American Medical Association and the national hospital organizations

"Several other principal features of the President's program will unquestionably be endorsed by the medical profession The most seriously controversial proposal, of course, is that recommending a federally financed national compulsory health insurance system

"As the public, both lay and professional, has a right to ask for candor and explicit details in the legislation to be offered, so, also, should we demand a show of honesty and realism in calculating the costs, financial and otherwise, involved in such an enormous experiment

"On this point, the *New York Times* offers a word of caution, suggesting that with at least one hundred million people insured, the demand for medical service will expand to an enormous degree, with the result that the cost of insured medical care may well amount to $4,000,000,000 annually rather than the $2,800,000,000 estimated by the President

"'Add the cost of building and operating the proposed hospitals and medical centers at Federal and State expense, and last, money allowances when sickness or disability prevents a man from working, and no one knows what the ultimate figures may be,' the *Times* points out

"'The hard facts must be faced,' continues the *Times* editorial, 'that we have a national debt which may well reach nearly $300,000,000,000, and that even this country's riches are not inexhaustible The small business man is the one who will suffer most by increased levies, whether they are imposed directly on his income or indirectly in the form of contributions His margin of profit is in many cases already so small that it will be harder than ever for him to survive'

"Insurance experts have pointed out that the present social security system is being maintained on an actuarially insecure base, due to the refusal of Congress to increase the rate of contribution beyond the original 1 per cent level that still obtains The normal rate originally contemplated to be in effect by 1945 would be 2½ per cent Some insurance actuaries assert that the level rate of contribution necessary to furnish the benefits provided by the Social Security Act is now actually nearer to 5 per cent than 2½ per cent

"If the American people really want socialized medicine, we may be sure that they will ultimately get it There is no point, however, in trying to 'sell' them socialized medicine under a phony label, nor should these goods be advertised for prices which won't meet the cost of production We do not ask the public to take our word for it that this kind of socialized medicine will not be good for them All we ask is that the public shall have an opportunity carefully and completely to examine the case, that beautiful promises shall be embodied with precise language, and that the views of medical men be given equal consideration with those of politicians in the ultimate decision

Mark Sullivan, writing in the *Herald Tribune*,[5] says

"The President's health program can become socialized medicine or remain free Which turn it takes depends on how the measure is written, after debate in Congress, and how the system is administered

"One test will be how and to whom the government pays the money for health insurance In Social Security the government pays direct to the beneficiary, and he uses it as he freely chooses If in health insurance, likewise, the government pays direct to the beneficiary, the beneficiary will be free to choose his own doctor, and doctors will have no cause for complaint in that respect. But if the government is to make the payments to doctors, government would in that case choose the doctors, or set up categories of doctors acceptable to it It would have much control over doctors, their fees, their standards of practice, and their relations with patients And with control over doctors would go control over patients By watching this and other tests, Congress, in writing the details of the measure, can

[4] Vol. 1, No 23, Dec 5, 1945

[5] December 9, 1945

achieve the benefits of health insurance without the dangers which doctors and others fear"

We could wish that it was as simple as all that. Oversimplification of a vast and complex problem can be as harmful to a workable solution as anything we can think of Fair debate of the whole question with adequate representation of the medical profession and of the public, with full publicity, is the next step

Frozen Foods

The last few years, even with wartime restrictions, have witnessed a large expansion in the field of frozen foods. While news releases and editorial comment in the press have announced the inauguration of new community locker plants, little information has reached the public concerning the comparative nutritive value of frozen foods. Mothers are asking the family physician more and more about feeding the family from the family locker Now that developments of much greater magnitude are in the production stage and will reach the consumer within the next few months, the alert doctor will become familiar with the trend and keep informed on facts regarding frozen foods, especially the nutrition and public-health features. Fortunately, the latter aspects have received considerable attention in recent studies

The loss of nutrients has been studied in blanching, freezing, storage, and cooking The freezing process retains more nutritive value than any other method of preservation. The losses during storage of frozen products are small The blanching and cooling prior to freezing vegetables, however, result in a considerable loss of vitamin C and significant losses of some of the other vitamins and water-soluble minerals Because frozen foods require much less cooking than fresh products, the loss of nutrients from cooking is considerably less. The net result is that frozen foods may have as high a nutritive value when they reach the table as they do when cooked fresh For example, frozen peas cooked after a year's storage may have as much vitamin C as the same product cooked within seventy-two hours after picking

Frozen vegetables are not as subject to deterioration in color and flavor in cooking as are fresh products In fact, greater palatability is an important factor in consumer preference for many frozen foods, compared with the corresponding canned products or even the fresh products as purchased in the market.

The public-health aspects of frozen foods have been authoritatively discussed in a report by a Committee of the Public Health Association.[1] This report points out that while freezing causes a large decrease in the micro-organisms present, it does not sterilize food and, further, that thawed products are more prone to spoilage than similar fresh products Thus the report states, "The same or greater care should be taken in handling foods prior to freezing as is given in handling similar foods which are consumed without freezing or storage" Regulations which should govern the operation of storage-locker plants are discussed A finding of special interest noted in this report is that the temperature commonly employed in cold-storage lockers and farm freezers kills trichinosis organisms

As new developments in freezing and storage are extended into individual homes, it becomes of special importance that there be a thorough understanding of the conditions or precautions necessary in the preparation of food for freezing and the conditions of storage Particularly, there is danger that frozen food may be held too long at too high a temperature, such as exists in the freezing compartments of many ordinary refrigerators Frozen foods should not be held above 15 F for more than a few weeks, because some micro-organisms can develop at this temperature To avoid deterioration in palatability, the storage temperature must be lower Taste and appearance will remain practically unchanged for a year at 0 F and

[1] Report of Committee on Foods of American Public Health Association, Am. J Pub. Health (Supplement) 33: 77 (1940)

for six months at 10 F , but only for a much shorter period at higher temperatures

The new developments should prove of special benefit to the nutrition and health of rural people Fresh fruits and vegetables as they are gathered from the garden can be preserved for out-of-season use, and a meat supply with its original flavor and other qualities can be constantly at hand A more nutritious and better balanced year-round diet should result Suburban and village people with vegetable gardens can similarly benefit Improved products in the markets and the new small storage units for the home may also mean a large increase in the use of frozen foods by the city dweller and a better diet accordingly Costs of products, equipment, and services will be large factors in determining the future expansion in the consumption of frozen foods

Detailed information on the freezing of foods can be found in the bulletin by Masterman and Lee,[2] and on their preparation for the table in the publication by Fenton [3]

Cobra Venom in the Treatment of Angina Pectoris

With the increasing prevalence of cardiovascular disease, the control of the pain in patients suffering from angina pectoris assumes increasing importance In a recent study Freedberg and Riseman[1] have attempted to evaluate the therapeutic value of cobra venom They review the literature since Monae Lesser, in 1929, first suggested its use for the control of pain and find 14 reported cases of angina pectoris treated by the injection of cobra venom "with uniformly good results" They point out that in all of these cases the benefits were evaluated by the clinical history alone

"It has been repeatedly demonstrated that when judged by the clinical history, beneficial results can be obtained with the use of placebos as frequently as with other medication, so that objective studies are necessary The present study was undertaken as part of an objective evaluation of methods of treatment in this condition, which has, up to the present, included approximately seventy different therapeutic measures"

For this study 12 patients were divided into three groups Group 1 consisted of those who, following the sublingual administration of 0 3 mg of nitroglycerin, were able to do 100 per cent more work than was possible without medication Group 2 patients were able to do approximately 50 per cent more work after taking nitroglycerin Group 3 patients failed to respond to any of the usual methods of treatment, including nitroglycerin

The daily intramuscular injection of venom in doses of 1 to 2 cm was beneficial in 7 of the 12 patients studied However, in patients in the 1 and 2 groups nitroglycerin was, with one exception, considerably more effective

"On the other hand, in 3 of the 5 patients comprising Group 3 the injection of cobra venom resulted in a significant increase in ability to do work In 2 of these patients cobra venom is the only drug out of fifty-seven tested to date that has enabled them to do more work or has resulted in demonstrable clinical improvement The increase in ability to do work under standardized conditions was paralleled by a decrease in the frequency of attacks in daily life"

In contrast to the effect of nitroglycerin, cobra venom did not prevent the electrocardiographic changes induced by exercise .Its action is, therefore, not that of coronary vasodilatation The authors' conclusion is, "Cobra venom apparently acts by preventing the patient from experiencing the sensation of pain It is, therefore, comparable to the surgical procedures designed to interrupt sensory nervous pathways and should, we believe, be reserved for patients in whom surgery is contemplated but who may possibly avoid it by the use of this medication."

[1] Freedberg, A Stone, and Riseman, Joseph E F New England J Med 233 462–466 (Oct. 18) 1945

AN EFFECTIVE CONTROL PROGRAM FOR RABIES

ROBERT H BROAD, M.D., Ithaca, New York, and ALEXANDER ZEISSIG, D.V.M., Ithaca, New York

(Health Officer, Ithaca, and Associate Professor of Bacteriology, New York State Veterinary College, Cornell University, Ithaca)

AN EDITORIAL on "Rabies Control" appeared in the NEW YORK STATE JOURNAL OF MEDICINE,[1] in which, among other things, some of the necessities of a rabies control program were outlined. An opportunity to put some of these recommendations into practice has presented itself in the case of Tompkins County. Since the results, up to the time this is being written, have been very gratifying, it was felt that an account of what was done might prove valuable to others faced with the same problem.

Preoutbreak Activities

Early in the spring of 1945, it was realized that the County of Tompkins was in the path of a spreading wave of rabies. The greatest threat seemed to be from areas to the south where cases of this disease were numerous. In February a group of the faculty of the New York State Veterinary College at Cornell University, realizing the possibility of this menace appearing locally, initiated a program to inform veterinarians, physicians, and the lay public of the known facts regarding the disease. After considerable deliberation a group of veterinarians and public-health officers decided upon a program of action to avert, if possible, the necessity of having to deal with this disease. This self-appointed committee invited city and county administrative officers to meet with it and consider the problem. The situation was presented by the Health Officer of the City of Ithaca, supported by the other members of the volunteer committee. Their proposals were favorably received by the county and city officials with the result that certain protective measures were initiated in an effort to shield the community and get it ready for the storm should it strike. The following recommendations were put in force. (1) It was decided to enforce more rigorously the night quarantine on dogs of the Department of Agriculture and Markets. It was felt that to the extent that this regulation was complied with there would be fewer dogs in circulation, at least during the hours of darkness. To implement this regulation each Town Board in the county agreed to appoint at least one town dog warden to supplement the work of the county dog warden. (2) The dog wardens of the county were instructed to pick up and dispose of all unwanted stray dogs. It has been well established that this class of dog is one of the principal disseminators of rabies. (3) It was agreed to alert the public regarding the potentialities of rabies so as to prepare them for the problem with which they might soon be faced. Vaccination of dogs as a preventive measure was discussed but it was felt to be too early to secure public cooperation. (4) Individuals were requested to report all dog bites to the family physician or health officer, and to have them properly treated. (5) The procedures to be employed should rabies make its appearance in Tompkins County were discussed. Among other things these included a Rabies Advisory Council and a public vaccination program as indicated in the editorial cited above.

The institution of the protective measures just outlined had a very beneficial effect. Through the educational work which was done by means of radio talks, addresses before service clubs and other groups, the public was prepared to accept some of the inconveniences necessitated by the proximity of this disease. Not only was there greater compliance with the night quarantine, but also many unwanted dogs were eliminated. Furthermore, many persons restrained the activities of their dogs as a protective measure. Finally, large numbers of dogs were privately vaccinated against rabies. Naturally, some of these procedures, particularly that of picking up stray dogs which were claimed as pets by groups rather than individuals, met with criticism. However, as soon as the necessity for what seemed like cruelty or overzealousness on the part of persons charged with protecting public health was explained and understood, this criticism subsided. We believe that the control measures instituted and the preparatory educational work which accompanied them made possible the snuffing out of the disease when it finally did make its appearance. This occurred during the latter part of June. Two dogs developed rabies within a few days of one another.

Presumably some stray rabid dog or other animal was responsible for both of these cases although the original animal was never found. Subsequently, a rabid fox was killed by a dog just outside the City of Ithaca. To date, there have been no additional cases.

[1] New York State J. Med. 45: 1639 (Aug. 1) 1945.

Procedures at the Time of the Outbreak

When rabies struck Tompkins County in June we had the machinery to combat it ready to spring into action Not the least of these weapons was an educated public As soon as the diagnosis was established, and without waiting for certification from the Commissioner of Health, we asked the local radio station to make spot announcements that rabies had appeared in the City of Ithaca and to request dog owners not to allow their pets to run loose They were requested instead to have them on a leash while on the streets The response to this request was phenomenal We were totally unprepared for the practically universal public compliance which followed The dogs disappeared from the streets For several days there was much barking and yipping emanating from the homes of dog owners In three or four days this racket ceased as the dogs became used to the idea Meantime, dogs which were encountered on the streets were on leash, and it was gratifying to observe that even the children were doing their part, as evidenced by groups of them with the neighborhood pet tied to the other end of a piece of clothesline

The first case of rabies happened to be discovered on a Saturday On Monday the general plan of control was presented to the city and county officials along with other interested persons at a meeting called for that purpose The group agreed that, regardless of the fact that under the law the Town Health Officer is the controlling official, active participation of all groups concerned would be necessary if success was achieved Furthermore, most towns and cities encompass an area which is too small for control measures to be effective The multiplicity of control units, that is, towns, might result in lack of uniformity in procedure leading to public confusion and dissatisfaction Under such an arrangement there is also apt to be much duplication of effort and facilities, which increases the public expense On the basis of these facts the group decided to pool the resources of the entire county The plan which follows is, therefore, drawn up on a county basis We see no reason, however, if a town were faced with a similar problem, why it would not prove equally valuable for such a control unit A résumé of the plan and its method of operation follows

A Rabies Advisory Council

Attempts to control rabies are frequently accompanied by accusations that this, that, or the other group has invented rabies to suit its own ends Certain groups may also be accused of exploiting the situation for their personal gain Where such is the case we do not believe that the individual or group should be shielded. On the other hand, it was felt that false accusations in these respects should be convincingly answered It would be better yet if they never arose One of the most important features of the plan proposed, therefore, was a "Rabies Advisory Council," on which were represented all of the elements of the community which would be concerned in the eradication program In addition to forestalling unjust criticism, this council was the source of many a constructive suggestion as well as being the means of bringing back to its constituency an understanding of what we were trying to accomplish

We believe that it was invaluable in creating public confidence in the procedures decided upon and in facilitating compliance therewith The Council consisted of

1 The District State Health Officer, Chairman
2 One of the town health officers
3 The city health officer
4 The County dog warden
5 Two dog owners
   (*a*) A representative of the ordinary pet owners
   (*b*) A representative of the Tompkins County Kennel Club
6 A representative of the Board of Supervisors

This council sponsored all of the publicity which appeared in the local papers on the subject of rabies It served in the same capacity in respect to a public vaccination program We feel that this sponsorship helped to "sell" both programs

Public Education and Public Relations

Public education, to the point where the people understand the nature of the problem, and harmonious relations between the public and those attempting to control rabies are the backbone of any effective program Therefore, it was agreed that the publicity campaign should be frank and correct in all respects It is also important that differences of opinion or bickerings about methods or procedure should not be aired in public because they divert attention from the main objective The second important feature of the plan which we proposed provided for a person through whom all material relating to rabies which appeared in the press of the county in all radio releases, and in talks before groups was cleared The cooperation of the editors of newspapers in this matter was solicited and obtained We might mention that in the beginning we had an unfortunate experience or two along this line When we understood the problems of the reporters and editors in fitting copy into a certain space, and they in turn under-

stood the necessity for accuracy and completeness, which was vital to us, there was no further difficulty To further facilitate smooth cooperation we agreed to supply material in finished form at regular intervals This lightened the work of the reporters and editors and assured us that the material which appeared was what we wanted it to be.

The official notice of certification was accompanied by an article in the local daily on interpretation of the law and the responsibility of the dog owner thereunder Posters explaining the fundamentals of the law were displayed in conspicuous places throughout the county The public was also advised to consider all dog bites as those of potentially rabid animals The importance of early treatment of such wounds was stressed and the people were urged to report immediately to the family physician to have it administered Bitten persons were also asked to try to remember enough about the dog responsible so as to provide the health officer with information leading to his identification This initial article was followed at one- or two-day intervals by others on "Animal Rabies," "Human Rabies," and "Vaccination Against Rabies."

Rabies publicity must meet some peculiar demands It would be unfortunate to have a plethora of articles at the time of the outbreak followed by a dearth which would allow public interest to lag On the other hand, such publicity can be overdone to the extent that the public becomes bored and indifferent. We, therefore, set out to prepare a short column each week under the caption, "The Fight Against Rabies." This column was short and to the point. By means of it we slapped people on the back when a good job was being done and prodded them where things seemed to be lax. We made announcements in connection with the vaccination program which the Council sponsored. We pointed out what was happening elsewhere. These weekly bits served to sustain interest in the subject. Since certification lasts at least six months after the last case is found, such sustained interest is a necessity

Quarantine

Of the two classes of methods in the control of rabies, the most important is the interruption of the cycle of infection by quarantine It is necessary to establish such a state, not only where the disease is known to have occurred but also in the surrounding area. Dogs with the furious form of rabies have been known to travel twenty miles or more from their homes The only way that such an animal can be prevented from infecting others during such a journey is to endeavor to convince dog owners in an area where the disease does not exist of the necessity of keeping their pets in isolation before the disease arrives. If this can be done, the rabid dog finds no other dog to bite. Such cooperation can be achieved only through an effective educational program

It is desirable to appoint extra dog wardens, if necessary, in advance of the appearance of the disease. Such individuals can do much toward eliminating uncared-for dogs prior to an outbreak, whereas, after the disease appears, they are indispensable, to insure compliance with the regulations. Such individuals should be selected because of their ability to deal courteously yet firmly with the public. Immediately following notice of quarantine, animals apprehended by the dog wardens were returned to their owners with a warning However, if a dog were found at large a second time, the owner was summoned into court and fined After about ten days the procedure was changed in that any dog caught at large was taken to the pound The owner was then informed that it was necessary for him to obtain a release from the court before his dog could be returned. As the public became educated along these lines, fines were imposed for first offenses These were usually $3 00 Subsequent offenses brought larger fines, or the offender might be placed on bail until the dog was properly confined or disposed of

Dog wardens were supplied with nooses and other equipment for catching and handling dogs found at large Nooses were also supplied to city police for emergency use The City of Ithaca provided its warden with a truck to be used for patrol and for transportation of captured dogs to the pound It was necessary to enlarge the pound facilities to accommodate the extra volume. It should be pointed out that in this matter, also, it was decided that it would be more economic and more satisfactory to have a single pound for the entire county

The justices of the peace and the Ithaca City Judge agreed upon uniform procedure to be followed in the case of violators of the quarantine. This insured equality and uniformity of treatment throughout the county

Dogs suspected of being affected with rabies and dogs known to have been bitten by a rabid dog must be especially provided for in an effective control program These two classes of dogs might be referred to as seven-day dogs and four-month dogs, respectively In the case of the seven-day dogs it is desirable, if practicable, to confine them in a suitable place, in order to determine whether they are infected with rabies, or are suffering from some condition with which it may be confused The rabid dog will die within one week of the onset of symptoms. In most

instances death will occur about the third day Allowing the rabid dog to die has another advantage If death occurs naturally, the chances of finding Negri bodies in impression preparations or sections seems to be increased Hence, much time may be saved in establishing the true diagnosis, and this information can then be applied in deciding upon the proper course of treatment of persons who may have been bitten In the case of a dog known to have been bitten by a rabid dog, the most radical and probably the safest procedure is to destroy the animal In the Tompkins County outbreak six dogs and three cats known to have had contact with rabid animals were destroyed during the ensuing week This action no doubt had a great deal to do with the failure of additional cases of rabies to appear in the City of Ithaca It may be of interest to note that despite the fact that one of the original cases of rabies appeared in a section of low economic status, it was necessary to take court action to destroy a dog in only one instance The alternative to destroying dogs known to have been exposed to rabies is to hold them in suitable quarters for a period of at least four months The present law provides that this shall be done at the expense of the owner, if he elects this alternative From our experience we believe that the holding of both seven-day dogs and four-month dogs for observation should be at public expense If either of these procedures becomes a matter of private expense to the owner, he will refrain from reporting such suspicious symptoms or exposure, thereby hamstringing the control program The reporting of exposures is particularly important since such dogs, suddenly showing symptoms of the disease, may bite members of the owner's family or be responsible for creating secondary foci of infection in an untold number of other animals

Vaccination

Vaccination is a weapon which has a valuable, though secondary, role in controlling rabies It is, however, considered by many to be an indispensable adjunct to quarantine The benefits of a program of mass vaccination to the dog owner are no greater than those derived by the general public It was the feeling of the Advisory Council that unless the cost to the dog owner were little or nothing, clinics for the vaccination of dogs would not serve a sufficient number to make their establishment worthwhile An appropriation for the establishment of free vaccination clinics was, therefore, requested at a meeting of the Board of Supervisors held the week after the cases of rabies made their appearance The Board appropriated $4,000 to be used for the purchase of vaccine, defraying the cost of administration, and other necessities arising out of the rabies control program The legal basis for this action was Section 12, Subdivision 28-C of the County Law The Tompkins County Board of Supervisors justly deserves commendation for their farsightedness and their assumption of responsibility for the public welfare and the protection of the livestock of the county

Prior to the initiation of the vaccination program the public was repeatedly informed of the importance of vaccination both as a means of protecting the individual dog and in preventing the development of an epidemic However, it was cautioned that until the "area was designated" a vaccinated dog had no privileges and could not be allowed to run at large Ten clinics were conducted in the City of Ithaca and twenty clinics in nineteen places throughout the county over a period of two weeks At these clinics a total of 3,312 dogs, or approximately 58 per cent of the county dog population, was vaccinated To insure each dog owner's being notified, postcards were sent each licensed owner requesting him to bring his dog to a designated clinic at a certain hour In addition, notice of the time and place of holding clinics was published in the daily paper and those persons not receiving cards were advised to bring their pets to the clinics nearest them for vaccination Volunteers addressed and mailed the appointment cards and assisted at clinics Firemen in the fire stations, which were used in many cases as clinics, set up tables and assisted in other ways The participating veterinarians, who were paid on a fee-per-clinic basis, definitely earned their money Two veterinarians were in charge of each clinic The procedures were so streamlined that the injection of vaccine, the fastening of vaccination tags, the making out of vaccination certificates, and the recording of the necessary information were so speedily accomplished that at some clinics 175 dogs were processed in a two-hour period Each owner was given a small handbill, a replica of which follows

Your dog has been vaccinated against rabies. The desired immunity will not develop for at least one month, and he should, therefore, be kept away from other dogs for this period of time or longer

Should your dog have been bitten by a rabid animal before he was vaccinated, the vaccine may not prevent him from having rabies

Rabies vaccination does not give 100 per cent protection but does give immunity to a sufficient number of dogs to make the procedure worth while If any dog develops rabies after vaccination it is not necessarily the fault of the vaccine or the veterinarian who gave it

The privileges of the vaccinated dog are at all times subject to the rulings of the State Commissioner of Health

The Tompkins County Rabies Advisory Council

The effectiveness of this program cannot be accurately measured, because we have no way of knowing what would have happened had the steps which we carried out not been taken For the past six months no new cases of rabies have come to our attention We feel, therefore, that the public money was spent well The cost of vaccination per dog, including the material, its administration, and incidental expenses, was about $0 60 Approximately two months after having been certified all of Tompkins County was designated by the Commissioner of Health as an area in which vaccinated dogs would be allowed to run at large Thus there have been six months of quarantine and four months during which vaccinated dogs have been running at large without a case of rabies having occurred We feel that the public is grateful for the aggressive program which was initiated and feel that it is to be congratulated because without its intelligent cooperation the results just mentioned would not have been obtained

---

ANSWER TO MUSCLE RIDDLE

The question of how living muscles contract and relax seems to have been answered by research by Prof A. de Szent-Gyorgyi, of Hungary, winner of the Nobel Prize for his isolation of vitamin C

The muscle research, finished by Prof de Szent-Gyorgyi during severe persecution by German and Hungarian Nazis was reported in full at a meeting of the Hungarian Society for Natural Sciences the first public act of scientific life after Hungary's liberation.

Discovery of a previously unknown protein and its role in muscle contraction were reported by Prof de Szent-Gyorgyi. He and his collaborator, Bruno Straub, named this protein actin.

Under certain conditions, actin forms filaments consisting of globular particles arranged in a string like the beads of a rosary These actin filaments or strings of beads unite with another previously discovered muscle protein, myosin Rod-shaped particles of myosin cling together side by side and at their ends adhere to the globules of the actin string.

When a potassium salt is added, the myosin is precipitated The consequent shrinkage bends the actin string toward the side of the shrinking myosin. The shortening which follows is seen as muscle contraction.

The myosin particles are attached to the actin string in a spiral pattern which much resembles a winding staircase, the actin particles forming its axis and the myosin particles its steps. Through muscular contraction, the complete system assumes the shape of a corkscrew

The cross-striation of voluntary muscles of the body is due to this spiral arrangement of the clusters of myosin-actin systems of which the muscle fibers are composed, Prof de Szent-Gyorgyi reports.

This has been proved by rotating the muscular fibrils under the microscope. During such rotation, the cross striation moves along the axis of the fiber This explains the difference between cross-striated muscle, such as that in the arms, and smooth muscle such as that of the heart. Inside smooth muscle, the actin-myosin systems are less closely packed and thus neighboring actin-myosin spirals differ in their phases

The three known conditions of muscles, relaxation, contraction, and rigor mortis, are accounted for by Prof de Szent-Gyorgyi's findings. Like myosin, actomyosin is precipitated by potassium chloride. If this reaction is performed in the presence of another chemical, adenosintriphosphate, the actomyosin not only precipitates but contracts.

This precipitation and contraction is limited to a very narrow range of salt concentration, outside of which the actomyosin splits into actin and myosin. Furthermore, the range of concentration depends also on the adenosintriphosphate concentration. Very slight variations of either cause a transition of the dissociated (relaxed) system into the contracted one

Relaxation of muscles corresponds to the dissociated actin-myosin system. Contraction of muscles corresponds to the associated one, while rigor mortis corresponds to the salt precipitation of actomyosin through decomposition in the absence of adenosintriphosphate.

Actin was discovered during investigation of what happened during a mistake, as scientists considered it, in extracting myosin from muscles.

The consistency of myosin differs considerably according to the duration of the process of extracting it. Short extraction yields a thin fluid Prolonged extraction produces a jelly Previous researchers usually discarded the jelly-like product, believing it to be the result of having "spoiled" the process of extraction.

Prof. de Szent-Gyorgyi, however, prepared filaments from the jelly-like product and immersed them in a muscle "soup," that is, a boiled extract of muscle tissue. The filaments from the "spoiled' extraction contracted vigorously Prof de Szent-Gyorgyi thus reproduced the vital function of muscle in the test tube and made it accessible for analysis.

Prof de Szent-Gyorgyi's results seem to open new vistas for explaining the nature of wave excitation and the mechanism of neural action. They represent a new approach to one of the oldest and most important problems of biology He has been invited by the Soviet government to give a number of lectures in Moscow about his fundamental researches.—*Science News Letter, July 14, 1945*

THE POSSIBILITY OF EXTERMINATING MAMMARY CARCINOMA IN MICE BY A SIMPLE PREVENTIVE MEASURE

Its Practical Implication for Human Pathology

LUDWIK GROSS, M D , New York City

(Chief, Research Unit, Veterans Administration Hospital, New York)

MIDDLE-AGED or old female mice occasionally develop breast tumors that are microscopically typical adenocarcinomas These tumors grow slowly but progressively, and infiltrate the surrounding tissues Eventually they may grow through the skin and ulcerate If untreated, they may attain considerable dimensions Metastatic tumors may ultimately develop in the adjoining lymph nodes, in other breast glands, or in the lungs When removed surgically, these tumors have a tendency to recur either at the same site or in distant organs Briefly, the mammary carcinoma in the female mouse appears to be a disease essentially similar to breast cancer in woman

At first it was believed that mammary carcinoma developed in mice "spontaneously," and that each tumor represented an individual entity, completely independent, and with no direct relation whatever to similar mammary neoplasms in other mice It was observed several years ago, however, that female descendants of mice suffering from mammary carcinoma quite often develop similar breast tumors [1-4] When descendants of parents who had died from tumors were mated among themselves in several successive generations, pedigreed families of mice resulted, in which practically all females developed mammary carcinoma upon reaching approximately one year of age [5-8] Pregnancy accelerated the development of breast tumors in these mice [9,10] In certain families, virgin females usually did not develop breast tumors, while those that had had litters as a rule died from breast carcinomas [9] The removal of the ovaries early in life could prevent the appearance of breast tumors in mice [11] Lung carcinomas frequently developed in older animals of these "tumor families "[9 12]

A series of fundamental experiments performed by the Staff* of the Roscoe B Jackson Memorial Laboratory, at Bar Harbor, Maine, on the "inheritance" of tumors in mice[13-15] formed the basis on which one of the most brilliant discoveries of modern medicine was made in 1936 by Bittner [16] In his studies[9,17-23] it was demonstrated that mammary carcinoma is transmitted in mice from mothers to their offspring through milk, and that the development of mammary tumors in female descendants of mice suffering from breast carcinomas could be prevented by isolating the newly born animals from their potentially cancerous mothers immediately after birth, and transferring them for the purpose of nursing to lactating females whose milk was free from the cancer agent These experiments were immediately confirmed and extended by Andervont and his colleagues at the National Cancer Institute in Bethesda, Maryland, and by many others [10 24-29] It was also soon demonstrated that mice of families free from tumors often develop mammary carcinomas following ingestion in early infancy of milk from foster mothers carrying the tumor agent [25-28 30] Further experiments demonstrated[20 27] that the mysterious tumor agent, present in the milk of animals that develop breast tumors, is so small as to pass without difficulty through Berkerfeld filters that retain all visible microbes The tumor agent can be inactivated by heating to the temperature of 56 C for thirty minutes

The tumor agent causes symptoms of disease, i e , typical carcinomas of the mammary glands, in females of susceptible families of mice The susceptibility to this agent is, however, apparently much more common than it might have appeared only a few years ago In recent experiments Andervont and Bryan[27] used ordinary albino mice of unknown parents, such as are furnished by dealers to various laboratories, within twenty-four hours after such market mice had thrown their litters, half of each litter was given for the purpose of nursing to females of a pedigreed high-tumor line (C3H), i e , to animals that are known to carry in their milk the carcinoma agent Over 80 per cent of animals that ingested the tumor agent developed breast carcinomas before they reached 1 year of age, whereas none of their sisters that had been nursed, as controls, by their own mothers died from tumors

Thus, mammary carcinomas develop late in the life of susceptible animals that ingested the tumor agent early in infancy, i e , at the nursing

Published with the permission of the Medical Director of the Veterans Administration, who assumes no responsibility for the opinions expressed or the conclusions drawn by the author

* The following individuals were on the staff[15] of the laboratory at the time, and contributed to the results published J J Bittner, E Fekete, C V Green, C C Little, J M Murray, W S Murray, and L C Strong

age In other words, animals susceptible to tumors and actually carrying the tumor agent do not display any symptoms of disease during their youth and early adult life They appear to be in perfect health and show no symptoms of tumors until they reach the tumor age, which is approximately 9 to 12 months for the mammary carcinoma of mice While in perfect health, however, these animals disseminate the invisible tumor agent, passing it through their milk to the next generation, i e., to their offspring, which, in turn, again transmit it to the next succeeding generation before they also perish from tumors The tumor agent may also pass through one or several successive hosts without causing any symptoms of tumors. A mouse may transmit the disease to her offspring and die before she has a chance to develop a tumor, or she may live her entire life span without ever showing symptoms of the disease And yet she may disseminate the tumor agent not unlike those mice that actually die from the neoplasms

These observations were so startling as to appear almost unbelievable at first sight. And yet they were true, were promptly confirmed in various laboratories, and had to be accepted at their face value Our entire approach to the problem of cancer had to be modified The following conclusions appeared unavoidable

1 Mammary carcinoma of mice is *not* a "spontaneous" disease. Each tumor can be traced to another similar neoplasm, the causative agent responsible for the development of the new growth having been transmitted from one individual to another of successive generations through the milk of lactating females

2. The agent that is able to reproduce mammary carcinoma in susceptible mice is filterable, and can be destroyed by heat. This agent is specifically pathogenic for certain hosts, and produces specific symptoms of disease It has, therefore, the characteristics of a virus [26 27]

3 The tumor agent can be acquired by ingestion, in early infancy, at the nursing age. On the other hand, the development of tumors can be prevented by isolation, in early infancy also, of the newly born animals from their tumor-agent carrying mothers. Hence, it is difficult to avoid the conclusion that mammary carcinoma of mice truly belongs to the broad group of communicable diseases.[31]

4. Most of the individuals carrying and disseminating the tumor agent are in perfect health. Thus, the tumor agent does not always cause symptoms of disease. It remains latent most of the time and in most of the cases. It causes fatal symptoms of disease, when activated by age, hormonal influence, and probably an array of other as yet obscure factors

5 The invisible tumor agent is transmitted from one individual to another of successive generations, i.e , from parents to their offspring, thence to the offspring of the offspring, again to the progeny of these offspring, and so forth, indefinitely, from one generation to another The term "vertical epidemic" has been suggested to designate this type of transmission of a pathogenic agent [31] It differs from that of the common communicable diseases, such as smallpox or measles, by the conspicuous fact that transmission occurs among individuals of successive generations, i e., "vertically," whereas in the case of smallpox, measles, or many other communicable diseases, individuals carrying the pathogenic agent transmit it to other susceptible individuals of the same generation, i e., "horizontally "

Vertical transmission of a pathogenic, invisible virus, causing symptoms of disease in descendants of diseased parents, may sometimes simulate inheritance, though in reality there is a fundamental difference between heredity and vertical transmission of parasitic agents

It is worth emphasis that vertical transmission of pathogenic agents is not limited to tumors, and that similar phenomena have long been observed in various diseases of plants and of insects Thus, the virus of the mosaic disease in the Duke of York variety of potato is transmitted from one generation to another as long as these potatoes are planted by their tubers, but can be immediately separated from these hosts by planting the seeds which do not contain the virus [32] Vertical transmission of the mosaic-disease virus has also been observed in various other plants [33] In insects, Pasteur demonstrated that the invisible virus of the silkworm disease called "pébrine" is transmitted from one generation to another through the eggs[34,35], the chain of transmission, however, can be interrupted by carefully selecting healthy from diseased moths, and using only eggs from healthy parents for the purpose of breeding Many other insect diseases that are transmitted vertically from one generation to another have been found [36] More and more observations become available suggesting that various rickettsial and spirochetal parasites are being transmitted vertically, from one generation to another, in certain insect hosts, such as the tick.[37–40]

For the casual observer there is a fundamental difference between a vertical and a horizontal transmission of a communicable disease. Cases of successive transmission of measles, smallpox, diphtheria, or other common communicable diseases that attack hosts within the same generation can be readily traced by the human observer, even though symptoms of disease may occasionally not develop in one or several intermediary

carriers On the other hand, the vertically transmitted agent of mammary carcinoma can hide for one or several generations without causing any symptoms of disease, it can submerge, and reappear after years, giving the casual observer the impression of a "spontaneous" disease Theoretically, it is possible to assume that breast cancer could kill the greatgrandmother, then skip the grandmother, mother, and so forth, only to reappear perhaps in the greatgranddaughter in its usual form of a typical breast carcinoma In reality, the tumor agent does not skip any of the individuals through which it passes They all carry the tumor agent, though many of them never show any symptoms of tumors Because, however, the mammary carcinoma agent can cause no symptoms, and because it is transmitted vertically, it may actually submerge for one, two, or more generations of hosts disappearing entirely from the sight of the most patient observer Years, and in man perhaps even a century or two, may sometimes elapse between cases of disease that have been caused by transmission of the same pathogenic agent The task of unveiling the pattern of vertical transmission of pathogenic agents appears almost superhuman, especially in hosts that have a comparatively long span of life Thus, the time factor may prove the most formidable obstacle in further studies on the epidemiology of tumors in man [31]

The vertical transmission of mammary carcinoma in mice has been demonstrated beyond any reasonable doubt The fundamental question arises whether malignant tumors in man may also be caused by pathogenic, invisible agents, transmitted vertically from one generation to another.

Systematic studies extending over several successive generations in man, similar to those of Warthin,[41] but performed on a large number of families, and covering a sufficient period of time, are necessary There are indications suggesting that certain tumors, at least, may be transmitted vertically from one generation to another, in man, not unlike breast cancer in mice It has been observed repeatedly that malignant tumors may develop occasionally in several members of the same family [31,41–45] In particular, the development of breast cancer in several members of certain families has been observed and studied in woman [46–52] Broca[46] reported the following case a woman died from breast cancer, her four daughters all died of tumors (2 breast carcinomas), of the sixteen grandchildren, eight died with neoplasms (5 breast carcinomas) Finney reported a family[48] in which the mother, four daughters, and three nieces had all been operated upon for cancer at the Mayo Clinic, all but one had cancer of the breast Handley[49] reported four sisters with breast cancers, their mother and grandmother also died of tumors Leschcziner[50] treated a woman for breast cancer, her three daughters all died of breast carcinomas. In Körbler's case[50] five of seven children of apparently healthy parents developed tumors One of the tumorous daughters had three daughters all of whom developed cancers of the breast Two granddaughters of this patient also developed breast carcinomas Wood and Darling[51] reported a family in which breast cancer or other tumors developed in numerous members of four successive generations three sisters of the third generation had breast carcinomas

It is true that in many instances women have been observed to develop breast cancers, though no similar or other tumors had been, at least to the patient's knowledge, observed in their ancestors It should be kept in mind, however, that the communicability of the tumor agent can be established only when accurate records are available for members of several successive generations Without such records, the tumor may appear to develop "spontaneously" In most instances, no reliable information is available concerning the cause of death of most of the family members of preceding generations of tumor patients The patient may, or may not, know the cause of death of her parents, infrequently, she may even remember the cause of death of one or two of her grandparents, perhaps even that of one of her greatgrandparents, but rarely, if ever, can information be obtained beyond this point. The information concerning one single preceding generation may be in many instances considered reliable, all further information, however, is, as a rule, incomplete, and not entirely dependable For that reason, it does not seem possible to evaluate at this time the probability of vertical transmission of tumors in man

Let us assume, however, as a working hypothesis at least, that breast cancer of women is not fundamentally different from mammary carcinoma in mice If this assumption is correct, breast cancer in woman is caused by an invisible agent which may be acquired in early infancy through the milk of the nursing mother Speaking with every reserve, it is possible to foresee that artificial feeding may be able to prevent the development of breast cancer in woman. There is no way of determining whether an expectant mother is carrying the hypothetic tumor agent, except by finding out whether there have been any tumor cases among the members of her immediate family, such as brothers or sisters, or, most important of all, whether there had been any tumors in her ancestors It should be emphasized that mice carrying the tumor agent are in perfect

health at the time they nurse their babies, they may develop tumors later in life, or they may never show any symptoms of tumors although they may be perfectly able to transmit the tumor agent to their offspring

Furthermore, it should be kept in mind that no more than a few hours of breast feeding may suffice to transfer the tumor factor from the mother to her offspring Thus breast feeding should be in such cases abandoned *from birth*, and artificial feeding substituted Artificial feeding of one single generation may suffice, since it has been demonstrated that the chain of the vertical transmission of mammary carcinoma in mice could be interrupted by foster nursing of one single generation of animals A history of any tumor appearing in a woman's ancestors, or members of her immediate family, should be therefore sufficient to warrant artificial feeding *from birth*, of this woman's children By this simple preventive measure, the development of breast cancer could be perhaps prevented in the next generation of these women

Even the most optimistic anticipations, however, could not expect a complete disappearance of all malignant tumors in man following artificial feeding of one or two generations Breast cancer may disappear, perhaps, following such a preventive measure, if breast tumors in women develop under conditions similar to those causing mammary carcinoma in mice. Other tumors, however, such as lung carcinomas, bone sarcomas, or intestinal neoplasms, may have other ways of transmission, if such transmission occurs at all

It should be emphasized that even the most radical conclusions based on experimental data thus far obtained do not warrant the assumption that *all* descendants of individuals developing tumors will eventually perish from neoplasms Current experimental data suggest only that the majority of descendants of tumor-parents will carry a latent tumor agent, and that this agent may become activated, and eventually produce tumors in some of these individuals In the laboratory animals, the development of such tumors in the carriers may be prompted by certain conditions, such as selective inbreeding by brother-to-sister mating, frequent pregnancies (forced breeding), application of certain carcinogenic compounds, etc. Under natural conditions of life, however, many, if not most, of the latent carriers will probably never show any symptoms of tumors.

We are only at the beginning of the long road leading to the ultimate conquest of tumors Accurate records of the cause of death of all persons, but especially those of cancer families, for at least several successive generations, are absolutely essential for the study of natural transmission of cancer in man It may well take centuries before the epidemiology of tumors in man will be definitely established, if such natural transmission of human cancer exists at all. In the meantime, however, over 160,000 people in the United States alone die each year of tumors. Of these, conservatively speaking, 25,000 to 30,000 are women perishing from breast carcinomas The simple preventive measure of artificial feeding of one single generation of man may save the lives of many thousands of women who otherwise would perhaps be earmarked to perish from breast tumors. The results of this experiment may not be known before the next generation reaches the tumor age, i e , after forty or sixty years. On the basis of data obtained in mice, however, it appears justified to recommend that such a preventive measure at least be tried, even though no sufficient evidence is as yet at hand to prove that breast cancer in woman is truly identical with mammary carcinoma in mice. In spite of the lack of such evidence, however, experimental data thus far obtained appear encouraging enough to warrant such a preventive measure in man The risk is minimal, if any The reward may be tremendous, and measured in human lives.

It is also worth remembering that heating to the temperature of 56 C for thirty minutes will inactivate the tumor agent in mice.[22] It is therefore reasonable to assume that pasteurization of woman's milk will also inactivate the cancer agent, if such agent is present in human milk at all A brief boiling of human milk, such as is routinely practiced in certain milk banks,[24] would serve the same purpose Thus, feeding of pasteurized or boiled human milk could be safely substituted for artificial feeding

The experiment in man appears well worth a trial [19 21,25]

Summary

Recent experiments leave no doubt that mammary carcinoma of mice, a disease very similar to, if not identical with, breast cancer in women, is communicable from one generation to another through the milk of nursing mothers Animals transmitting the disease appear to be in perfect health at the time they nurse their offspring, and do not display any symptoms of tumors until they reach the "tumor age" The agent transmitted in milk and responsible for the development of tumors has the characteristics of a virus it is filterable, and can be destroyed by heat The development of mammary carcinoma can be entirely avoided in susceptible mice by preventing the newly born animals from nursing their potentially cancerous mothers, and transferring the offspring for the purpose of nursing

to females whose milk is free from the cancer agent

A working hypothesis is advanced suggesting that human tumors may be similar to those of mice, and that breast cancer of women may perhaps be communicated from one generation to another through the milk of nursing mothers The nursing women may be in perfect health at the time they transmit the disease, and yet they may carry the tumor agent, and be therefore responsible for the development of breast cancers in their daughters later in life It is therefore suggested that women of families with any malignant tumors in their ancestry refrain entirely from nursing their children Since no more than a few hours of breast feeding may suffice to transmit the tumor agent, breast feeding should be abandoned in such families *from birth*, and artificial feeding substituted Feeding of pasteurized human milk should also be considered, a brief boiling of human milk, such as is routinely done in certain milk banks, would serve the same purpose

This simple preventive measure may save many human lives The results will not become evident, however, until the next generation reaches the tumor age

PSYCHOSOMATICS

When, in 1822, William Beaumont, a native of Lebanon, Connecticut, exercised his Yankee ingenuity by holding a pannikin under Saint Martin's gastric fistula and catching the drippings, he was selling the world no wooden nutmeg He was anticipating the work that Pavlov would do later with considerable refinement in technic—Pavlov, for instance, early abandoned the use of gunfire in producing his fistulas—and he was paving the way for the conclusions that Cannon would arrive at somewhat later on the bodily changes in pain, hunger, fear, and the various subsidiary emotions.

Beaumont, in other words, laid the groundwork for a scientific approach to the study of mind and matter, and the influence of the former over the latter—a reality empirically accepted and never for an instant doubted by Bishop Berkeley, the homeopaths, the mesmerists, Elisha Perkins, and the followers of Mary Baker Eddy

Except for a few ardent and credulous cults, however, and a numerically less imposing group of psychologically and scientifically minded physicians, it has required for the population at large a second world war and a popular pictorial magazine to acquaint the people with the actuality of psychosomatics

It is time for the public to tire of chasing vitamins, as a cat chases its tail, having it always with him but never catching up with it—the matter of vitamins was practically settled, as we are beginning to learn, with the discovery of food But the psychic origin of peptic ulcer is something new over which to agonize

The thought that a cold in the head, an attack of asthma, or a cardiovascular crisis may have its inception in the imagination is, for many, a novel idea with which to toy *New England J M , May 10, 1945*

THROMBOPHLEBITIS AND PHLEBOTHROMBOSIS

LAWRENCE L. HOBLER, M D , F A C S , Elmira, New York

IN RECENT years, a large amount of investigation in thrombophlebitis and vascular disease has radically changed our conception of thrombophlebitis and its treatment The purpose of this paper is to review the present conception of thrombophlebitis and to discuss the various methods of treatment

Intravenous clotting is of great significance because of its grave potential dangers as regards both life and subsequent disability Tragic consequences of pulmonary embolism following recovery from an operative procedure and a persistent disability not infrequently resulting from thrombophlebitic processes are of concern to all physicians, but particularly to surgeons.

Definition

It is important from etiologic, prognostic, and therapeutic standpoints to distinguish between the two major types of intravenous clotting thrombophlebitis and phlebothrombosis Ochsner and DeBakey[1] define thrombophlebitis as a partial or complete venous occlusion by an intravascular clot which is associated with and dependent upon inflammation of the vein wall They define phlebothrombosis as a partial or complete venous occlusion by an intravascular clot which is unassociated with inflammation, the clot remaining loosely attached to the vein wall The clotting in thrombophlebitis is the result of injury to the vascular endothelium from mechanical trauma, bacterial invasion, or chemical injury and results in a so-called white or inflammatory clot which is firmly attached to or into the vein wall In phlebothrombosis, the intravascular thrombus formation is due to venous stasis and to alterations in cellular and fluid constituents of the blood which increase the clotting tendency The clot is usually a result of a multiplicity of factors in which there is minimal damage to the vein wall, and results in the so-called red or agglutination clot which is loosely attached to the vein wall and has a long unattached tail On the basis of these differences in pathologic physiology lies the symptomatologic, prognostic, and therapeutic significance. In thrombophlebitis, the clot is strongly adherent and unless suppuration is present, rarely results in pulmonary embolism However, because of the inflammatory element, there is most likely to be an associated profound arteriolar spasm, resulting in edema which may be persistent and cause a prolonged disability

In phlebothrombosis the coagulum is loosely attached to the vessel wall and therefore is more likely to produce pulmonary embolism. Because it is a bland process, local symptoms are minimal and the condition is likely to be overlooked until symptoms indicating pulmonary embolism are present This may be too late for successful therapy

Incidence

The incidence figures of thrombophlebitis and embolism in various hospitals vary greatly and more recent analyses show that the incidence is decreasing Duryee[2] reports an incidence of thrombophlebitis of 0 44 per cent of over 100,000 patients admitted to the New York Post-Graduate Hospital, but notes that this hospital has no obstetric patients but an active vascular clinic

Evans[3] reports an incidence of 15 pulmonary embolisms in 550 major operations, 1.8 per cent, by Lahey Clinic surgeons in 1942

Cause

The factors involved in the production of intravenous clotting may be classified as predisposing and precipitating Predisposing factors are cardiovascular disease, advancing age, sex, seasonal variation, constitutional diathesis, obesity, debility, varicosities, excessive smoking, hematologic conditions, and foci of infection Precipitating conditions are tissue injury or trauma and circulatory retardation

Various authors[1,3] report that anywhere from 20 to 90 per cent of their patients with venous thrombosis have cardiac impairment. It has been shown repeatedly that the degree of prolongation of circulation time is directly related to the degree of cardiac impairment. The value of prophylactic treatment of cardiovascular disease has been adequately shown by a decrease in the incidence of venous thrombosis and mortality from pulmonary embolism to about 50 to 25 per cent of its previous incidence (Von Jaschke[1]—2,053 operations—1 75 per cent to 0 9 per cent) (Koenig[1]—2,000 operations—6.2 per cent to 0 95 per cent)

That age is a factor is shown by the fact that 60 to 85 per cent of the cases occur in those over the age of 40 years largely because of cardiovascular disturbances and circulatory retardation which predisposes to intravascular clotting In men, thrombophlebitis is most frequent at 50 to 70 years of age and in women at 40 to 60 years of age

Women are more subject to venous thrombosis

Read at the Thirty Ninth Annual Meeting of the Sixth District Branch of the Medical Society of the State of New York, Cortland, September 26 1945.

than men, in a ratio of 3 2, childbearing probably being the chief cause of this difference

Seasonal variation is more noticeable in colder climates, as the highest incidence occurs during the winter months The average incidence in the northern states is about two times that of southern states The vasospastic influence of exposure to cold increases circulatory retardation and predisposes to intravascular clotting The danger of postoperative chilling of extremities is to be noted

A constitutional diathesis to intravenous clotting definitely exists A definite familial history of such phenomena is often obtained The type of individual who is most susceptible to such an occurrence is the adipose, asthenic, weak-muscled, pale-skinned person who often has a marked vagotonia and psychic lability

That obesity is a factor in this disease has often been shown To illustrate, Snell[1] states that 30 7 per cent of his postoperative deaths in obese individuals were due to thromboembolism In 3,680 patients at the Mayo Clinic[4] undergoing intestinal operations, thromboembolism occurred in 3 2 per cent of those under 200 pounds and 7 1 per cent of those over 200 pounds

General debility is a factor, probably mainly by promoting circulatory stasis Varicose veins act similarly

Smoking has been shown to be a powerful vasoconstrictor One author recently tested skin temperatures and found an average decrease of peripheral skin temperature of six degrees after smoking Peripheral vasoconstriction acts by causing circulatory stasis

Hematologic disorders predisposing to thrombophlebitis consist of mainly the anemias, but polycythemia is also a factor In anemic states, especially posthemorrhagic anemia, the cellular elements are increased, especially the platelets The clotting time is markedly decreased and the anemia has a deleterious effect on the cardiovascular system, predisposing to circulatory stasis Malignant disease definitely predisposes to venous thrombosis The factors here are markedly increased blood coagulability, general debility, and localized pressure on veins

Hypothyroidism is a factor which acts through obesity and circulatory stasis due to poor cardiac and peripheral muscle tone Fungous infections of the feet are frequently the cause of phlebitis The postoperative period is a natural period for venous thrombosis to occur because of the multiplicity of factors which are inherent in that state Since the negative intrathoracic pressure is a factor in promoting venous return from the lower extremities, any decrease tends to reduce this flow Since shallow breathing is frequently caused by anesthesia and postoperative sedation, negative intrathoracic pressure is reduced] laparotomies, deep breathing is often difficult di to pain Ileus with increased intra-abdomin pressure tends to compress the abdominal vein and produce circulatory stasis Tight abdomina binders act similarly Venous return is also in fluenced by three other factors, one of which ha been previously mentioned Peripheral vasc constriction is very frequent in the postoperativ period because of trauma, anesthesia, and expo sure during surgery The second factor is skele tal muscle contraction The patient who is i from any cause but particularly in the postopera tive period tends to lie quietly and keep the lowe extremities inactive This produces venous sta sis and is probably one of the most important rea sons why postoperative thrombosis usually oc curs in the lower extremities The third factor i vascular stasis produced by normal anatomi structures and posture The inguinal ligament the adductor hiatus of the femoral vein, the origi of the soleus muscle, and the ligaments and ten dons at the ankle produce constriction of th femoral vein and its tributaries, predisposing t thrombosis in the plantar veins and the veins o the calf and thigh Posture has an importan relation to these anatomic structures Fowler' position, with the knees slightly bent, produces kinking of the popliteal vein This position also places the leg in a dependent position The calves of the leg tend to press upon the mattress, compressing the deep veins The purely supine position tends to produce vascular stasis because of the uphill course of the femoral vein to join the iliac vein at the pelvic entrance Two other anatomic points should be mentioned as favoring thrombosis in the left leg as contrasted to the right Due to embryologic development, the left common iliac is smaller and forms a more acute angle with the inferior vena cava than does the right common iliac vein The right common iliac artery crosses the left common iliac vein These two factors tend to produce greater venous stasis in the left leg than in the right Operative trauma in itself tends to produce venous thrombosis by direct trauma to veins and indirectly by causing changes in the blood constituents The albumin-globulin ratio is changed, the thrombocytes and leukocytes are more numerous, and their agglutinability is greatly increased Postoperative dehydration with hemoconcentration may be a factor

Clinical Manifestations

The clinical manifestations of thrombophlebitis are well known and will only be touched upon Classically there is fever, pain, and swelling of the involved extremity, leukocytosis, and increased sedimentation rate If superficial veins are in-

involved there is redness while if deep veins are involved the leg will be cold and pale For therapeutic reasons we will discuss briefly the mechanism of these symptoms The fever is probably due to inflammation in the wall of the vein, the pain was previously thought to be due also to the inflammation However, it has now been proved to be due to ischemia Prompt relief of pain following the establishment of normal blood supply through the extremity supports this contention. The edema previously thought to be due to venous obstruction is now known to be due to vasoconstriction and ischemia Relief of the ischemia reduces the edema dramatically

The symptoms of phlebothrombosis are often very minimal The patient is often restless and may have a sense of impending disaster, however, he has no pain, little or no fever, and usually no swelling The first symptoms are often referred to the pulmonary tract, with pleuritic type of pain, cough, dyspnea, cyanosis, hemoptysis, and shock Of diagnostic importance is an increasing pulse rate over a few days out of proportion to the temperature elevation Production of pain by squeezing the feet, dorsiflexion of the feet (Homan's sign), squeezing the calves, and palpating along the course of the femoral vein is indicative of the presence of a quiet venous thrombosis Whenever any of these signs are present or if a pulmonary embolism has occurred, phlebography may be done Phlebography or venography is indicated in any suspected thrombophlebitis or phlebothrombosis, also in all cases of pulmonary infarction, because Zink[1] has shown that in 70 per cent of cases with fatal pulmonary embolism there had been a previous nonfatal pulmonary infarct, the result of embolism.

The technic of phlebography is simple[4] The entire veins of both extremities are visualized by injecting 25 cc of 35 per cent diodrast solution into the dorsal vein of each foot The x-ray tube should be at least six feet distant and the film beneath the entire leg or legs A tourniquet is applied to the upper thigh immediately distal to the fossa ovalis, applied only tight enough to compress the superficial veins Approximately forty to sixty seconds after completion of the injection (injection at the rate of 1 cc per second) the x ray exposure is made, using soft-tissue technic. In this manner, the location and character of any filling defects can be determined and evaluated[5] and more appropriate treatment outlined

Treatment

The most important phase of treatment is in the prevention of these conditions or prophylactic treatment It is well stated that the greatest single factor favoring thrombus formation in the lower extremity is the sudden bed confinement of a previously ambulatory older person without the benefit of exercise or the aid of gravity in the maintenance of an efficient venous circulation The cardiac status should be elevated and treated particularly in the older age group The constitutional type should be watched for The obese patient should have preoperative reduction of weight if possible Varicose veins should be treated, if possible, in the preoperative period and in the postoperative period should have Ace number 8 bandages applied Smoking should be reduced pre- and postoperatively The patient's extremities, during and following surgery, should be kept warm Some authors routinely use a heat cradle The blood picture should be adequately treated preoperatively Fungous infections of the feet should be brought to a quiescent stage Postoperative hypopnea should be combated by the routine use of deep-breathing exercises, rebreathing into a bag, or carbon-dioxide inhalations In modern anesthesia a good preoperative basal anesthesia is desirable. The surgeon demands complete relaxation during a major surgical procedure, but the patient should not sleep for hours in a state of metabolic depression postoperatively before he reacts The routine use of metrazol or other stimulant postoperatively is to be commended, especially following intravenous sodium pentothal anesthesia Tight abdominal binders should not be used Dehydration should be avoided and fluid balance well maintained Ileus should be prevented or reduced as quickly as possible Active motion of the legs should be instituted early The patient should be gotten out of bed as soon as is compatible with his general condition and the surgery which has been done The gradual reduction of the postoperative bed confinement period in recent years has markedly decreased the incidence of thrombophlebitis as well as decreasing the disability period following surgery Fowler's position should be modified by having the legs elevated The latter will increase the amount of flexion of the thighs on the abdomen. Although it would appear that this would tend to constrict the femoral vein, actually the tension at the inguinal ligament lessens

Active Treatment—Active treatment of venous thrombosis of the extremities depends upon the type of process present and varies considerably in different clinics, but in general is divided into medical treatment and surgical treatment, or specifically anticoagulation therapy using heparin and dicumarol, vein ligation, and sympathetic ganglion or nerve block by paravertebral blocks, sacral blocks, or spinal anesthesia

These forms of treatment will be discussed individually but they all aim to (1) reduce the incidence of embolism, (2) decrease the clinical

symptoms of pain, fever, and edema; (3) reduce the period of total and partial disability

Anticoagulant therapy is the preferred treatment in most clinics, and Evans, of Boston (Lahey Clinic), has presented their program well [3 6 8] Prophylactically, for the past four years they have subjected patients with a previous postoperative or postpartum history of venous thrombosis or pulmonary embolism to anticoagulation therapy with dicumarol, beginning about three days after operation if there is no danger of hemorrhage

It should be mentioned that heparin or dicumarol has been proved effective[9] in causing the solution or disappearance of a thrombus, but only when given during the early stages of clot formation It has no effect when given after the clot has already organized, except in limiting an extension from the original thrombus

Heparin alone, however, is expensive for the patient and the administration tedious and laborious for the professional staff

Dicumarol, the active principle of spoiled sweet clover causing hemorrhagic disease of cattle, was isolated by Link at the University of Wisconsin[11] in 1941 Its action on the clotting mechanism is due to the lowering of the prothrombin content of the blood Whether this action is due to the inhibition of the formation of prothrombin in the liver or in the blood stream is unknown, but intravascular clotting is delayed when the prothrombin time is prolonged by dicumarol Dicumarol[10] has no consistent effect on the platelets, hemoglobin, red cell count, white cell count, capillary fragility, clot retraction, serum calcium, or fibrinogen The clotting time is prolonged only when the prothrombin time is reduced to low levels, usually about 40 per cent of normal

Regulation of Dosage —Evans[6] gives an initial dose of 300 mg of dicumarol for a patient below 120 pounds and 400 mg for one over 120 pounds A daily maintenance dose of 100 to 300 mg is administered, depending on the rapidity of the fall of the prothrombin time The average total amount required to maintain the prothrombin time below 75 per cent was 1,200 mg in eight days or 150 mg per day When the prothrombin time falls below 60 per cent or falls precipitously, the drug is discontinued These doses of dicumarol are given regardless of whether heparin is administered simultaneously Heparin administration in itself may cause a fall of prothrombin percentage to around 75 per cent of normal and does not necessitate stopping the dicumarol The administration of heparin is guided by the clotting time, done at least twice daily Heparin is given by continuous intravenous drip or intravenously every four hours, about 2 cc of heparin in 20 cc of saline, enough to keep the coagulation time between twenty and forty minutes

There is considerable difficulty in determining the amount of dicumarol necessary for effect and for its maintenance The latent period varies from one to six days so that in combined heparin-dicumarol therapy it may be necessary to administer heparin longer than the average two-day period With dicumarol, the prothrombin time may continue to drop as long as five days after the drug is discontinued

Dicumarol should not be given to patients with hepatic damage, especially if prothrombin percentage reduction has already occurred It is contraindicated in any case of hemorrhagic diathesis The morning prothrombin time should be determined before the daily afternoon dose of dicumarol is given Twice-daily determinations of the coagulation time of the blood are necessary to control the dosage of heparin Water-soluble vitamin K in 40 to 60 mg doses intravenously and repeated blood transfusions are the treatment for overdosage or secondary hemorrhagic states

In 56 patients with thrombotic emergencies treated with dicumarol with or without heparin by Evans from 1941 to 1943[6] two deaths occurred due to medication (hemorrhage), 8 cases (14 per cent) showed hemorrhagic phenomena, but in the 46 cases of thrombophlebitis, one benign and no fatal pulmonary embolism occurred. He feels, therefore, that this is the therapy of choice This opinion, in general, is also shared by Yahr, Reich, and Eggers, at Lenox Hill Hospital, New York City [11]

Evans uses paravertebral sympathetic procaine blocks only in cases of thrombophlebitis when signs of reflex arterial spasm are present, such as absent or reduced pulses, a white cold foot, or swelling

If the patient is over 50 years of age and has had a warning benign embolism, they consider venous ligation, but Evans feels that venous ligation may prove unnecessary except in rare cases of recurrent embolism occurring in spite of anticoagulant therapy

He further considers surgical venous ligation objectionable due to. (1) the additional operative procedure on a patient often very sick, (2) the added risk of an edematous leg, at least until collateral venous circulation is accomplished, (3) no opportunity to establish recanalization, (4) the necessity of ligating both sides, since it is often difficult to tell from which leg the embolism has metastasized unless the venogram has indisputably established this fact—and they frequently fail to do this, (5) the possibility that embolism has sprung from pelvic or abdominal veins, whether or not both legs are normal, (6)

the possibility that thrombosis may proceed above the level of ligation, and (7) the necessity and technical difficulty of tying the common iliac vein to get above the thrombus.[2]

Surgical Treatment.—In many clinics, the surgical treatment of venous thrombosis and embolism is still considered primarily the treatment of choice.

Takats, of the University of Illinois,[12] and Linton, of the Massachusetts General Hospital, Boston,[13] have recently summarized this viewpoint. Linton seldom does venography and mentions the frequent inaccuracies of this procedure. When the clinical chart shows a synchronous elevation of temperature, pulse, and respiration and minimal signs are found in the patient's legs, he feels a bilateral deep femoral-vein ligation is indicated. In 202 patients in whom a total of 280 femoral-vein ligations were done, there was no mortality due to the femoral-vein ligation. Only one died of subsequent fatal pulmonary embolism, and this embolus arose from the uninterrupted vein of the opposite, supposedly normal, leg. He uses anticoagulant therapy for patients with pulmonary infarction following femoral vein ligation. When thrombi were found in the femoral veins at operation, the iliac veins were aspirated of their thrombus by the insertion of a glass cannula. At first thought, this would seem a hazardous procedure, yet in none of 86 such patients did this dislodge a portion of the thrombus with embolism resulting. They use a large glass cannula almost the size of the femoral vein.

Serious sequelae following femoral vein interruption are rarely noted. Persistent edema is the most common one, but Linton claims it is no greater than if the phlebitis, especially of the femoral iliac group, had been allowed to run its natural course, and it is his opinion that the postoperative edema diminishes more rapidly after aspiration of the thrombus than if conservative treatment were followed. Postoperative follow-ups show that after one year there is little difference in the amount of edema whether the common femoral or superficial femoral vein had been interrupted. While 45 per cent exhibited some edema, the swelling was actually minimal and practically all the patients had discarded any form of supporting bandage or elastic stocking.

The patients, postoperatively, were allowed out of bed as soon as they became afebrile or their general condition permitted. This was frequently the following day. In 84 uncomplicated cases the average was four and a half days and the average number of days after ligation to discharge from the hospital was 8.4 days. Linton states that this relatively simple surgical procedure obviously offers a great saving in hospitalization as well as protection from possibly serious pulmonary embolism.

Fine[4] states that one out of every 17 to 20 patients with clinically recognizable thrombophlebitis of the deep veins of the lower extremities will die of pulmonary embolism, and he recommends dividing the femoral vein whenever signs and symptoms of thrombophlebitis of the lower leg exist or if a filling defect is demonstrable in the venogram.

Paravertebral Block.—Paravertebral sympathetic block is indicated primarily in the typical femoral thrombophlebitis when signs of arterial or venocapillary spasm are present, such as cyanosis, diminished pulsation, or intense stocking- or glove-like pain. There is an almost immediate decrease or relief of pain, the coldness and pallor of the tissues revert to normal, the edema decreases. The procedure is effective by producing vasodilatation and breaking the vasoconstrictor reflex arc.

The technic of paravertebral sympathetic block[14] is simple. Morphine and a short-acting barbiturate should be administered thirty to sixty minutes before the procedure. The patient is placed in a lateral decubitus position, the lumbar region is prepared and draped, and with 1 per cent procaine with epinephrine, skin wheals are made 4.5 to 5 cm. lateral to the upper part of the spinous process of the first, second, third, and fourth lumbar vertebrae. A 20-gage needle, 10 cm. long, is inserted so as to encounter the tip of each transverse process. The needle is then partially withdrawn and directed superiorly so that it passes between and beyond the transverse process, pointing slightly toward the midline. After inserting it about 4 cm. beyond the transverse process, it will strike the anterior lateral surface of the vertebral body in the retroperitoneal space and 10 cc. of 1 per cent procaine is deposited at each site. Within ten minutes the leg feels warmer, pain is decreased, arterial pulsations improve, and the patient has an area of hyposensitivity to pinprick from the iliac crest to just below the knee on the ipsolateral side. In some cases one treatment will suffice, but the treatments should be continued daily until temperature returns to normal and the symptoms subside. It is believed that vasospastic impulses can originate in a thrombophlebitic segment as long as fever persists.

Recently bromsalizol, a monobromhydroxybenzylalcohol preparation, has been suggested and used by Lee at Johns Hopkins.[15] Its anesthetic action is effective from three days to three weeks, and thus one injection usually suffices in a case of acute thrombophlebitis. It is totally nonirritating.

Other methods of producing sympathetic block

are continuous caudal[16] and spinal anesthesia The latter, the continuous spinal, although it should not be repeated, guarantees a complete sympathetic block, and if used initially serves as a proof of the effectiveness of subsequent paravertebral blocks, if indicated

Both sympathetic block and anticoagulant therapy have been used for the chronic stage of thrombophlebitis The results in general have been good with decrease of edema, healing of ulcers, and decrease in symptomatology

One thing about septic peripheral thrombophlebitis[17] we have not mentioned during this discussion The condition is most commonly associated with postpartum sepsis Clinically it is characterized by a high, more spiking temperature and a sicker-appearing patient Septic pulmonary emboli are more common in this condition, due to liquefaction of the clot The causative organism is frequently an anaerobic streptococcus Therapy should consist of penicillin and/or sulfadiazine If embolism occurs, vein ligation should be done This ligation should usually be of the common iliacs and ovarian veins

If necessary, the inferior vena cava should be ligated Sympathetic block and anticoagulant therapy are indicated here also

Summary

The causative factors and clinical manifestations of thrombophlebitis have been discussed

The various forms of treatment the prophylactic, the medical (anticoagulant therapy with combined heparin and dicumarol therapy), and the surgical (femoral-vein ligation and sympathetic ganglion block) have been presented

The most important phase of treatment is the prophylactic treatment Once embolism has occurred, active therapy must be instituted Various clinics differ in their preference for the medical or surgical therapy, but adequate therapy will definitely reduce the incidence of embolism, frequently a serious catastrophe, decrease the clinical symptoms of pain, fever, and edema, and reduce the period of total and partial disability

'DOCTOR JONES" SAYS—

An interesting article I was reading—the name of it was "Psychiatry Comes of Age" This was by an Albany psychiatrist (a specialist on mental conditions I guess everybody knows that) and one thing he said that interested me was that the Albany Medical College and Albany Hospital, back around 1902, had the first unit where in a "university hospital psychiatry and the other departments of medicine worked side by side under the same roof" Well—it was just about that time that I started interning at Bellevue Hospital and that they had what we all called the "insane pavilion" where they worked together "under the same roof" But Bellevue, while the university medical schools had charge of the medical services, of course, it was a city and not a university hospital

But the main point about it is that they were recognizing that mental and physical conditions were all tied up together that in the case that was principally mental a physical condition might be at the bottom of it And another thing the patient with arthritis, heart disease, or what not, where there wasn't any obvious mental disorder—there might still be some deep-seated and more or less hidden emotional disturbance that was affecting his condition—maybe even causing it Psychoanalysis—at that time it was what you might call in its infancy but it was already digging out some of these things Anyway, they were recognizing that sickness was sickness, whether it was primarily mental or physical and that the mind and body all worked together

There've been some remarkable advances in the mental line since those days, especially in recent years, and a big change in the public reactions For example, I've had two or three personal friends that've gone to mental hospitals with condition that looked pretty serious They've had this comparatively new electrical shock treatment and within a very short time, have gone home, as well as ever—if not better They've picked up their responsibilities and social activities where they left off—the same as if they'd been in the hospital with a broken leg So I guess, if psychiatry has come of age, we're all growing up a little —*Paul B Brooks M D, in Health News, Aug 6, 1945*

DESTRUCTIVE GRANULOMA OF BONE IN THE SKULL

MARDOQUEO I SALOMON, M.D., and CHARLES L ENGELSHER, M D, New York City

THE morbid entity usually known under the name of eosinophilic granuloma of the bone is so rare that in our opinion the case that we observed lately deserves publication The publication of such rare conditions is apt to render the clinician more conscious of them and perhaps many a spurious "cyst" or "hematoma" would result after careful investigation, in a granuloma of the type under discussion.

Case Report

A 20-month-old Puerto Rican boy was seen with a growth just above the temporal half of his left supercilliary arch, the lesion had allegedly appeared about four weeks before and kept on growing fairly rapidly

Both the family history and the personal past of the child were completely irrelevant. No history of trauma could be elicited, nor had the child previously had any infectious disease.

Physical examination revealed a fairly well-nourished child, with seemingly no subjective complaints, except on pressure of the tumoral mass on his forehead. This mass was a walnut-sized ovoid, with its large axis roughly parallel to the supercilliary arch. There was no discoloration of the overlying skin.

The mass itself adhered pretty firmly to the subjacent, but not so to the adjacent tissues, however the portion of skin covering the most prominent area of the tumor appeared to adhere fairly closely to the latter

The consistency of the mass resembled that of an encapsulated hematoma It was fluctuant, not painful, but tender

The x ray report was as follows a small, rounded pressure erosion in the left frontal region of the skull due to neoplasm. The outlines are smooth No sequestra are seen and there is no other evidence of active bone destruction

Otherwise the physical examination of the child was entirely negative so too, was the routine laboratory investigation, including a blood Wassermann of both the patient and his mother

The preoperative diagnosis of nonabsorbed hematoma (in spite of the emphatic denial of trauma) being made, an exploratory puncture was performed that yielded only two drops of thick blood. A small incision was then made, and a cyst-like yellowish brown semisoft mucoid mass was discovered The curette revealed, when the frontal bone was touched, an uneven, rough eroded surface of the latter—practically similar to the typical sensation yielded by an osteomyelitic bone. The frontal area was so thinned out that there was danger of perforating the bone. A drain was inserted. We decided to try penicillin and sulfadiazine. Accordingly 10 000 units of penicillin were given every four hours intramuscularly for seven consecutive days. In addition, about 30 grains of sulfadiazine were given daily also for one week. Far from diminishing the mass kept on growing—curiously enough, fairly fast about ten days after the incision was performed, the growth was approximately 50 per cent larger than when first seen. We decided then to reoperate. The diseased tissue was thoroughly excised.

Macroscopically, the cyst-like mass, which was not encapsulated was about 1½ inches in diameter, grayish, and densely adherent to the surrounding tissues including the frontal bone. A drain was left for a few days the wound healed uneventfully

The patient was and remains in good health four months after the operation.

The pathologic findings, as reported by Dr Leo Hochfeld, pathologist at the Parkchester General Hospital, were as follows

The specimen consists of 1 Gm. of greyish-white amorphous tissue. Histologically, the lesion appears to be a diffuse accumulation of a cellular exudate within a connective-tissue stroma. The most striking cell is an eosinophile with a bilobed and trilobed nucleus.

These cells are interspersed among the connective tissue stromal cells and blood vessels In some areas the stromal cells are edematous and appear to form the foam cells similar to these seen in Hand-Schüller-Christian disease. There are also many multinucleated giant cells to be found of the osteoclastic type This is the typical histopathologic picture of a destructive granuloma of bone

Comments

No attempt will be made in this article to discuss the very obscure physiopathologic relationship of the destructive granuloma of the bone with some other allegedly related conditions as Hand-Schüller-Christian disease and the so-called Letterer-Siwe's disease. It seems to us that in spite of some very interesting research done in this field,[1,2] further study is absolutely indispensable in order to arrive at such far-reaching conclusions as to consider all those three conditions simply as different aspects of the same clinicoanatomic entity We have the impression, regardless of the possible relation of the destructive granuloma to the other above-named conditions, that the former is an infectious process, although, so far no infectious agent could be incriminated the virus theory seems to be well founded. On the other hand, it was our belief in the infectious nature of the condition that led us to try penicillin. Of course, we were fully aware of the fact that penicillin is rather a failure against diseases caused by virus, but we consider that trial justifiable

The truly interesting point in this problem, from a practical clinical standpoint, is the differential diagnosis, as has been pointed out and discussed lately by Solomon and Schwartz.[3] Curiously enough, in an otherwise excellent textbook of *Minor Surgery*,[4] the destructive granuloma has not even been mentioned. And yet its existence should be kept in mind albeit in differentiation from more common acute and chronic inflammatory lesions osteomyelitis, tuberculosis, syphilis, and diseases caused by yeasts and fungi In some cases benign and malignant neoplastic lesions, e g., lipomas, fibromas, fibrosarcomas and even osteomas caused great difficulties in the diagnostic differentiation. Cysts and encapsulated hematomata should also be

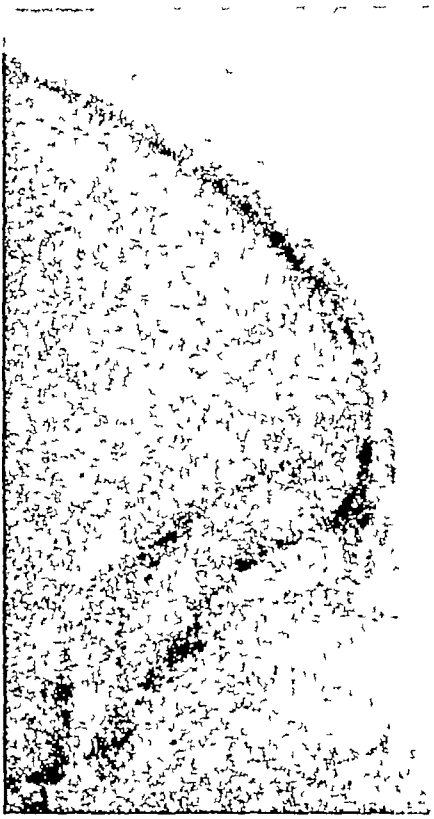

FIG 1 Lateral roentgenogram of skull

FIG 2 Section of tumor A, osteoclastic giant cell with many peripheral nuclei B, exudate of bilobed and trilobed eosinophiles, some polynuclears, and lymphocytes C, capillary blood vessel D, stromal cells, some are macrophages

borne in mind X-rays of the bone, together with an exploratory aspiration, will be frequently necessary to settle the problem Biopsy is peremptory While a granuloma of a long bone can still add Ewing's tumor to the list of possible confusions, we should not forget that in spite of its complicated nature, the differential diagnosis of the former from other conditions is of great importance not only from a strictly scientific point of view, but also from a practical prognostic standpoint For, except the very rare occasions when a granuloma is ultimately complicated by visceral lesions, the disease per se has an excellent prognosis

AN EXTREME CASE OF ALKALOSIS WITH NECROPSY FINDINGS

ARTHUR A FISCHL, M.D , and IRENE GARROW, M D , Long Island City, New York

(From the Departments of Medicine and Pathology, St John's Long Island City Hospital)

THE use of alkalies as a therapeutic procedure has come to the fore greatly within the past few years Before the advent of chemotherapy, alkalizing drugs were used largely in the treatment of the peptic-ulcer syndrome Since it has been shown that renal crystallization occurred much less frequently in an alkaline urine, the use of sodium bicarbonate has increased considerably Because of its popularity with the laity, and because of the renewed interest to the medical profession in the usage of sodium bicarbonate, certain inherent dangers in its indiscriminate use might be stressed

There is no doubt that many borderline cases of alkalosis are readily missed clinically Most cases are diagnosed routinely by a study of blood chlorides

Presented at the Section on Internal Medicine, Queens County Medical Society

or the carbon-dioxide combining power The picture of acidosis is seen much more frequently, particularly in diabetic and uremic states, where we are prompt to realize the electrolyte imbalance. In an effort to stimulate the same awareness of alkalosis this case report is given.

The normal values for plasma bicarbonate for venous blood range from 57 to 75 volumes of carbon dioxide per cent. A reduction below 50 volumes constitutes acidosis, and a value above 75 volumes means alkalosis.[1] Alkalosis implies that there is an increase in the alkali reserve of the blood Thus usually is not associated with a rise in blood pH In disease, the pH of the blood rarely becomes actually acid or alkaline, unless the patient is in a terminal stage of diabetic coma or alkalosis The limits of pH compatible with life are probably not higher or lower than 7.8 and 6.8, respectively

The following case report is presented briefly as one of the most severe cases of alkalosis found in the literature. It reveals the dangers in prescribing such an innocuous drug as bicarbonate of soda.

Case Report

The patient, a woman, aged 65, was apparently well prior to her present illness. On October 13, 1944, she began to vomit repeatedly A local physician was called three days later When he saw the patient, she appeared dehydrated but well oriented and ambulatory He made no definite diagnosis and treated her symptomatically by ordering a tablespoonful of bicarbonate of soda and a teaspoonful of sugar to be dissolved in a glass of water She was to take a tablespoonful of this solution every five minutes by the clock. The next morning the local doctor was called urgently He found the patient comatose and in a spasmodic convulsive state. He made a diagnosis of acidosis and advised immediate hospitalization.

The patient was admitted in a coma and had tetanic seizures in the emergency clinic. The coma and convulsions persisted. There was frothing at the mouth, cyanosis, and very slow respiration, 16 per minute, Cheyne-Stokes in character The temperature and pulse were not unusual. Neurologic examination revealed slight nuchal rigidity and pinpoint pupils, the latter due to pantopon. There were no abnormal signs in the chest and heart except for occasional premature ventricular contractions. The findings on later examination were found to be normal. The reflexes were active. The blood pressure was 130/72, the pulse rate 80 There was incontinence of feces and urine The spinal tap and blood Wassermann test were negative

The diagnosis of alkalosis was confirmed by examinations of the blood for carbon-dioxide combining power which on admission on October 28, 1944, was 138 volumes per cent. This was repeated and confirmed. The blood count showed considerable hemoconcentration—6,900,000 red blood cells, 132 per cent hemoglobin (Sahli), 22,400 white blood cells. The blood chlorides were extremely low—281 mg. per cent (or 79.2 millicquivalents) The blood creatinine was 1 7 mg. per cent, blood sugar, 115 mg. per cent, blood urea nitrogen, 03 6 mg. per cent. The urine was alkaline but otherwise negative

Active therapy was rapidly instituted. She received 6 000 cc. of normal saline by infusion, and 95 per cent oxygen and 5 per cent carbon dioxide by inhalation to stimulate respiration and overcome the high alkali reserve, and calcium gluconate to overcome the tetanic convulsive seizures.

After two days of intensive therapy her clinical picture improved. She became conscious and lucid and began to take food by mouth. Two days after admission her carbon-dioxide combining power dropped to 113 volumes per cent, and we felt that she might survive On October 31, 1944, her temperature rose to 104 F There were signs of pneumonic consolidation in both lungs. Therapy was of no avail and she died three days later

Relevant postmortem findings were as follows. There was extensive bilateral bronchopneumonia in the lungs. In the stomach there was an ulcer, 15 by 10 mm., 12 mm. proximal to the pyloric ring There was marked stenosis at the ulcer, the circumference measuring 8 mm. The pancreas grossly showed no changes. Microscopic examination confirmed the gross findings. Postmortem bacteriology revealed no pathogenic organisms recovered from the lungs, streptococcus hemolyticus was recovered from the spleen

Comment

There were a number of interesting clinical problems that arose in this case which might well be considered in other cases of alkalosis. One of the first was the presence of renal calcinosis, which very occasionally occur in electrolyte imbalance The urea nitrogen was quite elevated, and the thought of renal failure on that basis was considered Kirsner and Palmer[2] made a study of a group of patients who took large doses of alkalis and died of alkalosis. They came to the conclusion that prolonged ingestion of alkali did not permanently lower renal function. The precipitation of calcium in the collecting tubules is not a specific complication of alkali alkalosis. This condition of calcinosis of the renal tubules was first described by Nazari,[3] in the year 1904, in 2 patients with pyloric stenosis with severe vomiting The condition was produced in dogs after prolonged chloride depletion and alkali therapy The mechanism of calcium precipitation is not quite clear The deposition in the kidney after alkalosis is due to some physicochemical alteration in the state of the urine, resulting in the precipitation of calcium phosphate and calcium carbonate The process is very often a reversible one, disappearing when the alkalosis and obstruction is removed

The literature stresses the chloride depletion as a requisite for the production of renal calcinosis. Hatano[4] was able to prevent calcium precipitation during experimental hypochloremia and alkalosis by the intravenous injection of sodium chloride There was no evidence of renal tubular calcinosis in our patient. We felt that her renal findings were due to dehydration.

While alkalosis does occur from administration of soluble alkalies, it seems that the combination of alkali therapy plus deprivation of chlorides is the significant factor in the production of so-called malignant alkalosis. Kirsner and Palmer went so far as to determine the value of sodium chloride therapy with alkalis in the treatment of peptic-ulcer patients. They felt that alkalosis could be prevented in almost all patients by the concurrent administration of an adequate amount of sodium chloride However, these same workers also reported the tre-

mendous doses of alkalis that patients could take without developing alkalosis One patient took as much as 1,500 Gm in twenty-five days without developing alkalosis

The occurrence of tetany brings up the interesting factor of calcium metabolism and alkalosis The blood calcium in cases of alkalosis is invariably within normal limits The tetanic convulsions occur in cases of alkalosis associated with chloride deprivation The condition is particularly common in vomiting with alkali therapy Wilensky[6] described 2 cases of gastric tetany and alkalosis due to postoperative vomiting It is generally accepted that the determining factor in the production of tetany is the concentration of ionized calcium in the plasma and extracellular fluid of the body, rather than to the total calcium concentration The increased neuromuscular excitability appears to be due to an imbalance between the concentration of ionic calcium in the extracellular fluid and within the tissue cells The tetany of alkalosis is not explicable on the basis of calcium deficiency, because the serum calcium is not significantly lowered It is thought that the shift in the acid-base balance of the blood toward the alkaline side causes a reduction in the ionic calcium fraction without altering the concentration of the total serum calcium

The tetany is therefore due to the lowering of the concentration of the calcium ion in the plasma and extracellular body fluid during the period of alkalosis The administration of calcium chloride and calcium gluconate apparently stopped the tetanic convulsion of our patient

A most important factor in the management of alkalosis is the problem of dehydration and with it the question of hemoconcentration A hemoglobin of 132 per cent and a red blood cell count of 6,900,000 with a urea nitrogen of 63 mg per cent are indicative of the disturbed water balance which this case presented This must be overcome almost entirely by intravenous saline and glucose therapy

No discussion of acid-base balance could be complete without reference to the excellent monograph of Gamble[7] He very tersely summarizes the therapy of alkalosis "Restore the volume of blood plasma, administer saline and glucose in adequate amounts"

Summary

A severe case of alkalosis following excess alkali intake and vomiting is reported Therapy consisted of saline, glucose, and calcium, and apparently was meeting with success The patient, however, developed a widespread aspiration bronchopneumonia and expired It might have been wise to administer penicillin with the intravenous solution to a patient in such a prolonged coma, but it was not then available.

Competition for Prize Essays

The Merrit H Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York

The Lucien Howe Prize of $100 will be presented for the best original contribution on some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York

The Merrit H Cash Prize of $100 will be given to the author of the best original essay on some medical or surgical subject Competition is limited to the members of the Medical Society of the State of New York, who at the time of competitition are residents of New York State

The following conditions must be observed

Essays shall be typewritten or printed with the name of the prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device The essay shall be accompanied by a sealed envelope having on the outside the same motto or device and containing the name and address of the writer

If the committee considers that no essay or contribution is worthy of a prize, it will not be awarded

Any essay that may win a prize automatically becomes the property of the Medical Society of the State of New York "to be published as it may direct"

All essays must be presented not later than April 1, 1946, and sent to the chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York

ELECTION OF OFFICERS, TRUSTEES, AND COUNCILORS

President, Edward R Cunniffe, *Bronx*
President-Elect and
First Vice-President, William Hale, *Utica*
Second Vice-President, Stephen R Monteith, *Nyack*
Secretary, Walter P Anderton, *New York*
Assistant Secretary, W Guernsey Frey, Jr, *Forest Hills Gardens*
Treasurer, Kirby Dwight, *New York*
Assistant Treasurer, James R Reuling, Jr, *Bayside*
Speaker, Louis H Bauer, *Hempstead*
Vice-Speaker, F Leslie Sullivan, *Scotia*

The following trustee was elected for a five-year term ending 1950

John J Masterson, *Brooklyn*

The following councilors were elected for a three-year term ending 1948

Maurice J Dattelbaum, *Brooklyn*
Dan Mellen, *Rome*
Oliver W H Mitchell, *Syracuse*

ELECTION OF A M A DELEGATES

The following were elected 1946–1947 delegates Dr Thomas A McGoldrick, *Brooklyn*, Dr John J Masterson, *Brooklyn*, Dr Stephen R Monteith, *Nyack*, Dr J Stanley Kenney, *New York*, Dr George W Kosmak, *New York*, Dr F Leslie Sullivan, *Scotia*, Dr James M Flynn, *Rochester*, Dr Louis A. Van Kleeck, *Manhasset*, Dr Scott Lord Smith, *Poughkeepsie*, Dr Walter W Mott, *White Plains*

The following were elected 1946–1947 alternate delegates Dr Harry Aranow, *Bronx*, Dr William Hale, *Utica*, Dr Thomas M D'Angelo, *Jackson Heights*, Dr Edward T Flood, *Bronx*, Dr John T Donovan, *Buffalo*, Dr Benjamin M Bernstein, *Brooklyn*, Dr Ezra A Wolff, *Forest Hills*, Dr Stanley E Alderson, *Albany*, Dr Ralph Sheldon, *Lyons*, Dr Moses H Krakow, *Bronx*

ELECTION OF RETIRED MEMBERS

The following members were elected to Retired Membership

Harrison C Allen, *Endicott*
Dexter D Ashley, *New York*
Rudolph Boenke, *Long Island City*
Arthur H. Bogart, *Brooklyn*
Adolph Bonner, *Brooklyn*
William W Bostwick, *New York*
Robert Burns, *Syracuse*
William J Cavanaugh, *Poughkeepsie*
Jerome S Chaffee, *Sharon, Connecticut*
J Bayard Clark, *New York*
Frances F Cohen, *Bronx*
Rufus Ivory Cole, *Mt Kisco*
Herman K. DeGroat, *Buffalo*
David Deutschman, *Bronx*
Beaman Douglass, *New York*
Frederic C Eastman *Pittsfield, Massachusetts*
John W Edwards, *Brooklyn*
Kendall Emerson, *New York*

August F A Wiggers, *Flushing*
James P Wilson, *Buffalo*
Edward D Wisely, *Atlanta, Georgia*
Robert C Woodman, *Middletown*
Frank Clark Yeomans, *New York*

Section 111

Announcements

SPEAKER BAUER I have two announcements to make the newly elected Council will meet upstairs in the offices of the Erie County Medical Society on the eighteenth floor immediately after the adjournment of the House The Board of Trustees will meet immediately following the adjournment of the Council

Section 112

Report of Reference Committee on Report of Planning Committee for Medical Policies

SPEAKER BAUER Gentlemen, we have some more business to attend to Let me have your attention I will call for the Report of the Reference Committee on the Report of the Planning Committee for Medical Policies, Dr Di Natale, Chairman

DR PETER J DI NATALE, *Genesee* The organization of the Planning Committee was on the same basis as the preceding year, namely, the President, the President-Elect, the Secretary, a member of the Board of Trustees, Speaker of the House, and six members appointed at large by the Speaker

This Planning Committee also interested other members of the State Society and also had meetings with other interested individuals in compiling this report

General Scope—The Planning Committee for Medical Policies feels that there should be evolved a progressive, forward-looking program of the methods of distribution of medical care in order to maintain our system of free enterprise and to preserve the fine tradition of American medical practice

It is the desire of the Planning Committee that everyone in the State of New York receive adequate medical care of high quality

The abrupt termination of the war with Japan

approximately three months after the cessation of hostilities in the European theater has again brought into focus the large problems involved in the methods of distribution of medical care

Powerful sectors of public opinion, particularly those close to government, are highly organized These pressure groups would force a legislative program of federally sponsored medical care, probably compulsory, which medicine would have to accept Such a program, we know, would be definitely inimical to the public welfare

Organized medicine would seem to be the only integrated and influential group that still remains to oppose this dangerous situation, and we must maintain a united front in order to win this struggle.

This would be a propitious time to re-emphasize the fact that, in our opinion, the principal function of government in medicine is prevention, and to offer our cooperation with the government to the fullest extent in providing preventive medical care to the public. In our thinking we have adhered to the premise that it is our desire to see that every one in the State of New York receives adequate medical care of high quality

Many suggestions for changes in our present system of medical care have resulted from the tendency among certain groups to stress the need for medical care among the lower income groups, and that this lack is the primary cause of the inadequate economic situation of these people and they advance this as an argument for the overthrow of the American system of practice We would reiterate that it is the economic situation which needs to be remedied rather than our medical system, and the removal of such economic barriers, as has been stated again and again by competent medical authorities, should be an end in itself and not used as an argument for a different system of medical care. This is an evidence of the failure of government and not of the medical care

The Planning Committee has studied and given consideration to a formidable list of subjects, namely, diagnostic aids and health centers problems of the care of the chronically ill the report of the preliminary survey by the Subcommittee on Laboratory Service and Medical Care group practice, compulsory sickness insurance voluntary medical-expense insurance, relationship of the hospitals and the practice of medicine, the nursing problem, medical education and licensure and industrial medicine.

Diagnostic Aids and Health Centers—Any discussion of this subject must be prefaced with the assumption that the government has in mind a comprehensive and ambitious program to control the care of the sick. One must distinguish between improvement in the care of the sick—a wider and more complete distribution of the care for the sick—on the one hand and on the other, the control of the care of the sick.

Our Planning Committee has given extensive study and review to numerous proposals and projected plans, some actively in operation in local areas of the state, and others representing the combined thinking of medical groups.

The Planning Committee recommends as an *experiment* that a center for diagnostic aids to physicians practicing in the *rural* districts be set up in a selected location in either or both of the following designated areas

(a) The counties of Schuyler Chenango and Tioga,

(b) The north and northeastern part of Delaware County, the southwestern part of Otsego County, and the southeastern part of Schoharie County

In so far as possible, these facilities are to be set up by the local communities, and where necessary subsidized by the state if the local community cannot afford to build and operate them The medically indigent and those unable to pay for the use of these facilities should receive them free. Those who are able to pay should do so to decrease the amount which is necessary for the State or local community to contribute This would make the centers partially self-sustaining. Details of management of course, will have to be carefully worked out

The Council should be authorized to take such action as may be necessary to carry out these recommendations, including the sponsoring of any necessary legislation A committee should be designated to cooperate with state or local agencies and with county societies to insure proper functioning and supervision of such diagnostic centers.

The Committee also recommends that the State Society through its proper agency, exert its best efforts to secure prompt improvement and expansion of existing facilities for diagnostic aid throughout the state where the need has been shown to exist

We are cognizant of the necessity of protecting the public against bureaucratic regimentation of both patients and physicians, and the substitution of an un American system of medicine for our present high standards of practice.

I move the adoption of this portion of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. DI NATALE *Care of the Chronically Ill.*—The Planning Committee recommends cooperation and collaboration with the present state agencies concerned in the planning for the care of the chronically ill The Committee also recommends the support of the principles contained in the regional hospitalization idea as described in the Interim Report of the Pepper Committee on Wartime Health and Education, and the provisions of the Hill-Burton Bill with such amendments as have been suggested to bring it within the scope of the Constructive Program of Medical Care of the American Medical Association.

I move the adoption of this portion of the report.

DR. ARTHUR J BEDELL. May we have that read again, that reference that we approve of the Pepper Bill, and so forth?

DR. DI NATALE It reads

"The Planning Committee also recommends the support of the principles contained in the regional hospitalization idea as described in the Interim Report of the Pepper Committee on Wartime Health and Education, and the provisions of the Hill Burton Bill with such amendments as have been suggested to bring it within the scope of the Constructive Program of Medical Care of the American Medical Association.

SPEAKER BAUER That is not the Pepper Bill concerning the E.M.I C., Dr Bedell.

DR. BEDELL I fully appreciate that, but it seems to me that those opposed to us and who are thinking of themselves will take that excerpt and can readily say that we as a Society have approved of that bill. It is a common method of propaganda.

SPEAKER BAUER What do you suggest Dr Bedell?

DR. BEDELL That we delete the reference.

SPEAKER BAUER The reference to the Pepper hearings?

DR. BEDELL The Pepper Bill and the other bills We can carry through the thought without the source reference

SPEAKER BAUER But the State Society and the A.M.A. have already gone on record as approving the Hill-Burton Bill

DR BEDELL I like the name of "Pepper" only as a condiment

DR DI NATALE I don't like the name of "Pepper" either

DR BEDELL I move you the deletion of the reference to the Pepper Bill.

SPEAKER BAUER It has been moved by Dr Bedell that the report be amended by deleting the reference to the Interim Report of the Pepper Committee on Wartime Health and Education

The amendment was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

SPEAKER BAUER We now have this portion of the report as amended for adoption. Is there any discussion on that?

The question was called, and the motion was put to a vote, and was unanimously carried

DR DI NATALE *Report of Preliminary Survey by the Subcommittee on Laboratory Service and Medical Care* —The report of the Sullivan Committee has shown that the State of New York, by and large, is in a generally satisfactory condition as to ordinary medical care, especially general practitioner services The report has disclosed certain areas as being definitely deficient in adequate laboratory and other diagnostic facilities, particularly certain portions in the northeast area of the state and in the south-central region, and in the districts comprised by the Catskill Mountains area.

We are not at all content with the status quo, and we can readily see how in any county there is ever room for improvement

The Planning Committee is in full agreement that laboratory facilities should be furnished As used in this report, the term "laboratory facilities" means, in addition to routine chemical, bacteriologic, and serologic examinations and other pathologic work, the related clinical tests, such as X-ray, metabolism tests, electrocardiograms, and similar clinical procedures Blood transfusions also should be made available, but this facility is being developed as the result of legislative action at the last annual session

The primary purpose of these centers is not to furnish a diagnosis but rather to make available to the physician in attendance the results of all such tests, thereby enabling him to make his own diagnosis No treatment is to be provided. No member of the staff of such a center is to be permitted to engage in the private practice of medicine

Pending further development of contemplated state plans and the possible enactment of such legislation as the Hill-Burton Bill in Congress, we feel that no sweeping state-wide program should be recommended now, but rather insist on local experiment Your Committee further believes that such local centers, located in carefully selected areas, can be operated successfully and without danger to our present free and unfettered practice of medicine

This is only for information, and the Planning Committee has no recommendation thereon

SPEAKER BAUER Informative only, gentlemen, and it requires no action.

DR. J STANLEY KENNEY The Reference Committee has made no reference to Recommendation Number 5, on page 6 Did you do anything about that?

DR DI NATALE Yes, that was reported on, and the House voted to delete the reference to the Pepper Committee

DR KENNEY Recommendation Number 5 reads

"Should the Hill-Burton Bill or similar legislation be enacted into law and Federal funds thus become available for new or expanded medical-care programs in this state, or should funds be made available by the State of New York for the same purposes, we recommend that an existing or special committee of the Medical Society of the State of New York be designated to confer and collaborate with the proper government agencies concerned with such projects, this committee to have authority to present organized medicine's views and opinions and to consult with and advise and otherwise guide those formulating such programs"

DR. DI NATALE It was apparently left out in the typewriting of the report

SPEAKER BAUER Do you wish to move any amendment, Dr Kenney?

DR KENNEY No, but I wish to see it in.

SPEAKER BAUER It is left out of the committee's report Do you wish to incorporate it therein?

DR. KENNEY I would move to have that incorporated

SPEAKER BAUER Dr Kenney moves to incorporate this part of this recommendation of the Planning Committee in the report at this point Is there any discussion?

The motion was seconded, and as there was no discussion, both the amendment and the motion as amended, calling for the adoption of the amended section of the report, were put to a vote, and were unanimously carried

DR. DI NATALE *Group Practice* —In the present stage of our thinking, the subject of group practice represents a profound and controversial problem. We have made no attempt this year to deal with it in detail, nevertheless we have discussed it in a general way

Your Reference Committee feels that this subject of group practice should be taken up as a major study by the Planning Committee for Medical Policies in the near future and give it the time and thought it deserves to be allotted to it

I move the adoption of this portion of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. DI NATALE *Compulsory Sickness Insurance.* —This was the subject of an extensive review in the Planning Committee Report of 1944, and a thorough analysis of the Wagner-Murray-Dingell Bill introduced into the Seventy-Eighth Congress was published in that section of the report Extensive analysis of this new bill either has appeared already or will appear in the near future

The Wagner-Murray-Dingell 1945 Bill varies in some particulars from the previous bill. While the word "compulsory" is nowhere used in the bill, the bill nevertheless is compulsory in every sense of the word

Your Planning Committee reaffirms the Society's previous stand against compulsory sickness insurance in general and disapproves of the Wagner-Murray-Dingell Bill. Your Reference Committee heartily endorses the stand of the Planning Committee for Medical Policies in regard to the Compulsory Insurance Bill.

I move the adoption of this section of the report.

. The motion was seconded, and as there was

no discussion, it was put to a vote, and was unanimously carried.

DR. DI NATALE *Voluntary Medical Expense Insurance*.—Our State Medical Society has set up a Bureau of Medical Care Insurance with a full time director and the necessary personnel The Planning Committee for Medical Policies believes that no single activity of the State Medical Society is more significant and more deserving of united support. With reference to the use of the insurance principle in the case of welfare patients we would reaffirm our stand of last year, namely, that the Council suggest to the Welfare Department that it consider the possibility of the use of the insurance principle rather than the present system, in other words, the provision of hospitalization and medical care to the indigent by local authorities under voluntary hospital and sickness insurance plans

In furtherance of this statement, we would recommend that this whole subject be referred for study and action to the Committee of Medical Care Insurance of the Society This Reference Committee approves this recommendation, and I move the adoption of this section of the report

The motion was seconded, and as there was no discussion it was put to a vote, and was unanimously carried.

DR. DI NATALE *Relation of Hospitals and the Practice of Medicine*.—The President Dr Herbert H. Bauckus appointed a special committee to confer with a similar committee of the Hospital Association of New York State Dr Carlton E. Wertz, of Buffalo, is Chairman and the other two members are Dr Mott and Dr J Stanley Kenney Both Dr Mott and Dr Kenney are members of the Planning Committee

The Joint Committee held three meetings during January, February, and March, of 1945 and as a result of these conferences the following agreement, which is subject to ratification by the governing bodies of both the State Society and the Hospital Association of New York State, was arrived at

1. That roentgenology, pathology anesthesiology, and physiotherapy constitute the practice of medicine and the rendering of those services is, in fact, the practice of medicine.

2 That these specialties are so recognized, and that the directors of the departments rendering these services should have full recognition in the constitution of the hospital staff

3 That an equitable arrangement can be made between the individual hospitals and the doctors who practice these four specialties recognizing the above principle whereby the hospital may bill for these services in the name of the person rendering the service (This can be done by inserting the name on the regular hospital billhead, i.e., instead of x ray, indicate 'Professional Service of Dr ———, Roentgenologist.')

4. Until such time as a medical-service plan is available there is no objection to inclusion of these medical services in the hospital-service-plan contract as long as the principle of recognition and proper remuneration to these specialists is carried out.

Your Reference Committee approves these recommendations of the Planning Committee for Medical Policies, and I move the adoption of this portion of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. DI NATALE *The Nursing Problem*.—Your Planning Committee has made a study of the nursing problem, and recommends that the House of Delegates approve that the Committee on Nursing Education be given the authority, and expanded if necessary, to confer with similar groups from the official hospital and nursing organizations.

The Reference Committee approves these recommendations of the Planning Committee for Medical Policies on the nursing problem, and I so move that this portion of the report be adopted.

The motion was seconded and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. DI NATALE *Medical Education and Lacensure*.—Your Planning Committee has studied the problem of medical education and licensure, and although it is recognized that the accelerated program of medical schools of the country may be advantageously followed by a few students, it is the consensus of opinion of most of the medical educators that continuance of the present accelerated program beyond the war needs would be detrimental to the best interests of medical education. Your Planning Committee for Medical Policies concurs in the above opinion.

Your Planning Committee has no special recommendations or other comment on the subject of medical education and licensure, and there is nothing further we want to say on that subject either It is informative only

DR. KENNEY No recommendations were made on that subject, Mr Speaker, because of the special committee of the Council that was created to study this whole problem of the basic science law, the cults, and other matters pertaining to medical licensure

SPEAKER BAUER That has been taken care of in other resolutions.

DR. JAMES F ROONEY There is something significant about this, because I am informed that there is some change contemplated in relation to admission to licensing examinations in New York State that may be promulgated in the newspapers very shortly I think it would be appropriate to recommend, and I would so move, that the House approve this statement in relation to medical licensure and the accelerated program, and that it be referred to the Council for continuing study and action as required.

The amendment was seconded, and as there was no discussion both the amendment and the motion as amended, calling for the adoption of the amended section of the report, were put to a vote, and were unanimously carried.

DR. DI NATALE *Industrial Medicine*.—The Committee again this year has devoted much time to the consideration of the important subject of industrial medicine.

At the outset we should restate that the American Medical Association, through its Council on Industrial Health, has done a tremendous amount of work on this subject. This Council has set up in great detail the scheme of organization of committees within component county societies which would include the representatives from the Medical Society, from labor from industry, and from the public, such committees to study the different problems that affect industrial medicine today, and will affect it in the future. Labor has very definite ideas as to how it would like to work with medicine, industry has ideas and they are not always generous toward medicine. The profession has its ideas as to how it would like to retain control. In most of the present arrangements the influence of the

medical department of an industry is never very great It rarely reaches into the higher brackets, nor does it have a voice in the policy-making It is just this state of affairs which has promoted the American Medical Association to bring together all these groups for free discussion and to let industry and labor know that medicine has something to offer, and that it should be accepted as a major factor in formulating policies concerning industrial health and medicine Unless we want to initiate such a plan as the American Medical Association has so carefully worked out, we are relatively helpless, because both industry and labor feel that we are not interested

The future would seem to portend the larger role that big employers are going to have in questions having to do with medical care We feel that organized medicine should be very active on this subject We have all the information we need It has all been worked out very carefully by able men throughout the United States, and is very plain and concise

We also would recommend to the Postwar Planning Committee of the state and county societies that they bring to the attention of physicians returning from military service the facilities offered in the field of industrial medicine

We would respectfully suggest to those responsible for undergraduate medical education that those diseases and afflictions peculiar to industry be given adequate recognition in their teaching programs.

The 1944 House of Delegates recommended that the Council bring to the attention of the proper State authorities the suggestion that the medical staff of the Department of Labor be increased so that members might assist county society committees in coordinating their work with the definite work of the Department It is again urged that the Council give this suggestion serious attention

Your Reference Committee approves the recommendations of the Planning Committee on Industrial Medicine, and I move the adoption of this portion of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. DI NATALE The Planning Committee's report also deals with the Baruch Committee and Physical Medicine Commission reports, War Participation Committee, county society plans

The Reference Committee wishes to congratulate the Planning Committee of Medical Policies on its reports, and I would like to move the adoption of the report of the Reference Committee, as amended, as a whole

DR. JAMES F ROONEY I should like to amend, Mr Speaker I would like to second the recommendation of the Committee to adopt the report, as amended, as a whole, but would also like to amend to the effect that the Council be informed of the action of the House, that the Planning Committee be continued, and that the Council continue its activities in relation to studying those various matters that have been referred to the present Planning Committee in order to afford the opportunity to take the necessary action for the future

DR DI NATALE That is in the last paragraph of my report

SPEAKER BAUER He has such a recommendation in his report

DR. ROONEY I thought he had finished

SPEAKER BAUER I thought he had too

DR DI NATALE We believe that the life of this Planning Committee for Medical Policies should be extended, or if not, some other committee should be designated, as the Council deems necessary, to further study these medical problems in even more detail than the Sullivan Committee

SPEAKER BAUER Was that "extended" or "continued"?

DR DI NATALE The better word would be "continued", that the life of the Planning Committee be continued

SPEAKER BAUER Do you make that as a recommendation?

DR DI NATALE Yes, and I so move

SPEAKER BAUER Does that take care of your point?

DR ROONEY That is quite all right, but I think my amendment is a little more extensive, perhaps, than the recommendation of the Reference Committee, because mine gives the Council power to continue to study these various matters and to take such necessary action as in their discretion they feel advisable

DR DI NATALE We will accept that as part of the Reference Committee's report and recommendation

DR J STANLEY KENNEY I would like to second that

SPEAKER BAUER The Committee accepts it, so this portion of the report, as amended, is up for discussion Is there any?

The question was called, and the motion was put to a vote, and was unanimously carried

DR DI NATALE Now I move the adoption of the report as a whole, with the amendments and the additions that have been made

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 113 (See 14)

Report of Reference Committee on Report of Council—Part X Workmen's Compensation

DR. LEO F SIMPSON, *Monroe* I would like to move, as this report is purely informative and contains no controversial issues, that it be published without action by the House

DR EZRA A. WOLFF, *Queens* I introduced a resolution which was referred to this Committee, and I have not yet heard it disposed of

SPEAKER BAUER That resolution is separate This is the report on the Workmen's Compensation What is your pleasure?

DR JAMES R REULING, JR. I move that it be printed without action by the House since it contains no controversial issue and is purely informative

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

The report referred to is as follows

Your Reference Committee has carefully reviewed the Council Committee's Report on Workmen's Compensation and believes that it indicates a year of progressive activity It was also a year of striving for the maintenance of high standards in the care of the sick and injured, of striving for a more speedy and equitable administration of the law, and also for the protection of the physicians who function under the law

It seemed feasible to your Reference Committee that we should comment on some of the activities of this Council Committee, to be informative only and to make this information reliable as of today

The first part of the report deals with the free-choice principle in workmen's compensation and its importance in maintaining the highest quality of medical care to injured and ill workers It is important to emphasize this principle, as there are always individuals, both within and without the profession, who are eager to revert to the old system of permitting the employer or insurance carrier to dictate the choice of a physician.

It is the opinion of your Reference Committee that the free-choice principle is not completely operative in New York State as yet It is, of course the function of the Compensation Bureau of the State Society to correct any evils that may exist because it is in contact with the powers that can do it. On the other hand the State Bureau must get its facts from the component county society compensation boards before it can act, so if the county boards are unwilling to go all out in this matter the insurance carriers will draw the natural inference that we are not in earnest.

As a corollary to the free-choice principle which is a benefit to the workingman it is important to recognize that the medical societies have a responsibility in guarding the quality of medical care and during the year 1944 and early this year the Director of the Compensation Bureau held conferences throughout the state with county medical societies in an effort to get them to take a greater interest in the control of medical practice in the interest of the public. Moral and ethical qualifications will have to be considered as well as those that have to do with professional competency

Medical Practice Committee—The next matter was a consideration of the Medical Practice Committee, which has assumed the functions of the compensation boards of the four county societies in Greater New York If any proof is needed of the harm that can be done to the profession as a whole by the unscrupulous acts of some of its members the appointment of the Medical Practice Committee is a shining example

In the four New York counties the Medical Practice Committee is now paid by the state It attempts to carry out functions which formerly were carried out by the compensation boards of four of the largest county societies in the state The expense of these men, in salaries alone is $22 500 and in addition, there is a large overhead for attorneys, clerks, etc.

The director of the Division of Workmen's Compensation of the Department of Labor in July 1944, called upon the local county medical societies to again do the work of qualifying doctors since no three-man committee could successfully carry out this function. The county societies have agreed to do this. This fact should be given due recognition. Thus, one large part of the functions of the Medical Practice Committee has been delegated back to the medical societies. In the arbitration of medical bills the Medical Practice Committee is even less successful. The local county medical societies are dissatisfied with the procedure recently suggested whereby one man of the committee may hear a case and refer it back to his colleagues. The three members of the Medical Practice Committee are surgeons, and it is not within the bounds of reason to assume that any one would have the adequate knowledge to properly arbitrate issues in matters not in his field. Furthermore let it be said no provision is made for an appeal from such decisions

Complaints continue to come in as to the in equitable awards to physicians by the committee

The Medical Practice Committee has not, to our knowledge tried a single doctor in the four counties for violation of Section 13-d, disclosed by the Moreland Commission, although the medical societies disposed of most of these cases before the law was changed on June 1, 1944 The medical societies spent thousands of dollars to retain attorneys to do this task properly but the Department of Labor has done nothing about the remaining cases which the medical societies were unable to hear because of the limitations of time, and for other reasons These total several hundreds of physicians

No instance is known in which even the most flagrant offenders have been called upon to stand trial as required by law Furthermore, in no instance has the Chairman of the Workmen's Compensation Board exercised his rights, in spite of all the clamor made by the Moreland commissioners even to temporarily suspend one of these physicians pending trial.

It is a physical impossibility for the Medical Practice Committee no matter how able it may be, to properly perform the duties required of them by the law So it is clear that the interest of the state, from the standpoint of prompt efficient and economic carrying out of the purpose and intent of the Workmen's Compensation Law, requires the restoration of the functions of the four county medical societies on a par with the other fifty-seven counties of the state.

Your Reference Committee guided by a feeling of apprehension, feels strongly that it behooves the Medical Society of the State of New York to press for this restoration in the immediate future with every honorable means at its command.

Medical Examining Facilities—Your Council Committee reports concerning the help given the Department of Labor by the various county medical societies during the year in aiding the Department of Labor at its request, in determining whether the facilities available throughout the state were adequate in carrying out the medical examinations by medical examiners of the Department of Labor The county societies actively cooperated and made valuable contributions for the improvement of both mechanical and medical facilities to carry out such examinations. The Department of Labor is now utilizing the reports of the county societies to improve conditions.

Fee Schedule—A revision of the Workmen's Compensation Fee Schedule upwards and the removal of the 5 per cent discount taken by the insurance companies for payment of bills within thirty days were asked by a resolution passed by the House of Delegates last year

Your Council Committee has been actively at work on both of these requests, and although the recent change in the Department of Labor called for in the Condon Bill has delayed matters somewhat, they are being carried on.

The revision of the fee schedule upwards has demanded a great amount of preliminary work in anticipating the bearings that will be called by the new chairman of the Workmen s Compensation Board

1 Several letters were sent to the new chairman of the Workmen s Compensation Board requesting her to increase the fees to cover the increased cost of medical practice and of living.

2 A survey was made of the compensation fees paid in every state in the union.

3 Specific, detailed information was secured from every county medical society in the state, involving the cost of medical practice, the medical fees for persons of like standards of living and,

from the membership, information was obtained concerning medical fees in private practice throughout the state, and their opinions as to the need for an increase in compensation fees All of these data have been compiled

4 A conference was held with the insurance-carrier organizations in an endeavor to reach an agreement on an increase of the fee schedule in advance of a public hearing that might be called by the commissioner

5 Conferences were held with the President of the New York State Federation of Labor and other labor leaders in an effort to obtain the support of labor for the proposed increase

6 Groundwork was laid to secure the support of Associated Industries of New York, and more than a little progress was made

Your Council Committee has suggested for some time individual changes in the schedule which experience has proved are necessary in many of the specialties and in minor surgery—in addition to striving for a general revision upwards in the schedule Your Reference Committee feels that your Council Committee has been diligent, aggressive, and is well prepared with factual data Although action may be somewhat delayed because of the difficulty in securing agreement of the many interested groups that are involved, we have good reason for optimism

The chairman of the Workmen's Compensation Board has not yet set a date for a hearing on our request for a general increase in the fee schedule

Collection of Medical Bills—A new bureau has been set up by your Council Committee for bill collection and adjustment of disputes between physicians and employers and insurance carriers

It is proposed that this bureau serve as a clearing house for the fifty-seven county medical society compensation committees, outside the metropolitan area, on matters concerning physicians' medical bills in compensation cases

Many of the smaller county societies have no facilities for protecting the interests of the physician in workmen's compensation cases, and it is proposed that the facilities of the bureau be made available to all such counties that desire it, and request it

This will be a consultation service only, or an active intervention on the part of the bureau in the physician's behalf, if it is so desired It is designed to straighten out disputes, and also that physicians' bills may, in the future, be more promptly paid, or, if settlement is not possible, to be promptly arbitrated

Your Reference Committee feels that this is a proper function of the state bureau

Expert Consultants—The amended law of 1944 provided for the setting up of panels of medical experts in various specialties to assist in the adjudication of claims, and to resolve disputes concerning medical care Up to the present time nothing has been done to set up these panels

Your Council Committee has taken steps to secure from every county in the state the names of men qualified to serve in the Department of Labor in the above capacity These names have been submitted to the President of the Society for his approval and are available to the new Chairman of the Workmen's Compensation Board

Your Reference Committee joins with your Council Committee in urging the appointment of these men at the earliest possible moment to facilitate the settlement of claims and to avoid the long-drawn-out confusion now prevailing in many cases These various specialists would act as aids to the referees and to the Workmen's Compensation Board We have just heard from Miss Donlon that it is her purpose to explore this matter within the next month She will first have to determine the budgetary requirements of this program

In a closely related field, your Council Committee has repeatedly recommended the separation of the claims and medical departments of the insurance carriers This same effort has been made by other groups, but has not, up to the present at least, been adopted by the insurance carriers

Standards of Qualification—Your Council Committee has completed a set of standards to guide the county medical societies in the qualifying of physicians for compensation work These have been sent to every county medical society in the state, and questions concerning the method of qualifying any particular physician may be referred to the state society bureau for opinion

The director of your bureau has appeared before most of the larger county societies, and has pressed for compliance with these standards on the rating of physicians The Medical Practice Committee in New York City has also adopted similar standards

Radiology Examinations—Your bureau has increased the number of examining centers for compensation rating in radiology In addition to the one in the metropolitan area, new centers are being formed in Buffalo, Rochester, and Syracuse Similar committees will also be formed in other centers as the need arises

Your Council Committee, in addition, has the responsibility of endeavoring to improve the medical aspects of the law itself as dictated by the experience gained in operating under it Several instances could be cited, for example

An important matter in which your Council Committee has been concerned during the past year was the question of the relationship of radiologists, pathologists, anesthesiologists, and physical therapy physicians to the hospitals of this state Your Council Committee joined with a special Council Committee, of which Dr Carlton Wertz is Chairman, with a committee of the New York State Hospital Association, and with a joint Council representing the above-named specialists, in a series of conferences to iron out many difficulties that had existed before, and which were accentuated by several amendments to the compensation law that were enacted as a result of the Moreland Commission's activities

These amendments, for instance, make it mandatory that all fees coming to a radiology department of a hospital be allocated to the radiologists, and that it becomes a misdemeanor for him to give back to the hospital more than 33 1/3 per cent of the whole for the use of the apparatus, etc To work under any other plan was classified as fee-splitting, and it became a misdemeanor not only under the Compensation Law, but also under the Education Law

As a result of these conferences, which, no doubt, will be reported to you more in detail by another committee, the hospitals have recognized these specialists as part of the practice of medicine, and not a hospital function

Your Council Committee, as a result, recommends amendments to the Compensation Law and to the Education Law These are aimed to modify the present unworkable law as related to radiology as is now supposed to be in effect

It is recommended adding to the law, when medical services are referred to, that radiology, physiotherapy, pathology, and anesthesiology are a part of the practice of medicine, and to correct the

fee-splitting section of the law where it relates to these specialists and the hospitals by these words, "except that mutually agreed reasonable and equitable division of any fee received under this chapter for x ray examination, diagnosis, or treatment, physiotherapeutic examination or treatment, pathologic examination or diagnosis, or administration of anesthesia, may be made by a physician duly authorized to render such services, and a nonprofit hospital furnishing facilities for such examination diagnosis, treatment, or administration" For proprietary hospitals a refund of from 33⅓ to 40 per cent should be adequate.

Your Council Committee is also prepared to suggest other changes in the law

1 To prevent the abuse of the right that the patient has to transfer from one doctor to another The proposed boards of specialists would be of great value here.

2. Under the law the employer or carrier is entitled to have the claimant examined by a qualified physician of his own choice, and failure of the claimant to agree to it is a bar to recovery of compensation for that period This is all right for the ordinary examination, but certain examinations may be considered of major importance, and the patient should not be subjected to such an examination by his own physician and also by the carrier's physician. This refers to such examinations as encephalography, cystoscopy, spinal puncture, etc.

Your Council Committee believes that the law should be amended so as to entitle the employer or carrier only a consultation representative at such major examination to protect its interest, but the major procedure should be performed by the patient's own physician, or specialists, unless the patient and his physician waive this right

The carrier or employer should have the right to object to the necessity of such a procedure when authorization is required but should not have the right to perform the procedure itself, and then have the patient subjected to the same examination by his own doctor

3 Under Section 13-g of the Workmen's Compensation Law, the employer is made liable for the payment of medical services rendered by a physician and upon receipt of a bill for such medical services may dispute the bill within thirty days after its submission. In that event the employer or carrier is entitled to arbitration of the medical bill as provided in this section If the employer (or carrier) does not inform the Workmen's Compensation Board and the doctor of his demand for an impartial examination as to the amount claimed by the physician within thirty days after receipt of the physician's bill, he is deemed to have waived the right to such arbitration and the amount of the bill is deemed to be the fair and reasonable value of the services rendered by the physician. This applies also to hospital bills. There is no express provision in the statute for the procedure to be followed by the physician or hospital to collect his or its bill either in cases in which the bill was disputed and the arbitration was had and the employer does not pay the award or where the bill was not disputed and, under the statute, its amount is deemed to be the fair amount of the services rendered and is not paid. And, as there is no provision under the present law for the enforcement of payment of such bills by the Workmen's Compensation Board, the physician or hospital is required to sue at law to collect. There should be an amendment giving the Workmen's Compensation Board the right to make an award for medical and hospital services in these cases.

4 Your Council Committee recommends an amendment to the law that would make provision for employment by the Department of Labor of an adequate staff of investigators, headed by a deputy commissioner, who is an attorney, to police the Workmen's Compensation Law as it applies to physicians, insurance carriers, employers, commercial houses dealing in medical supplies and apparatus, and commercial laboratories of all kinds, and all other parties at interest. This "department of investigation" should be state-wide and should, of its own initiative or on recommendation of any party of interest, make investigations. All charges of violations of any of the provisions of the Workmen's Compensation Law against physicians shall be referred to the Compensation Committee of the Medical Society (or at present, in cities of over 1 000,000, to the medical practice committee) for hearing or trial. Recommendations for punishment to be made to the Workmen's Compensation Board.

Section 14-d should be amended in such a manner as to give the Chairman of the Workmen's Compensation Board independent right to hold hearings or make investigations and either to temporarily suspend a physician or to suspend or revoke his license after a hearing.

It is believed that if such a department of investigation is set up in the Department of Labor, evidence of evils and abuses under the Workmen's Compensation Law and wrongdoing on the part of physicians in violation of Section 13-d may be more readily detected and punished.

5. Your Council Committee would modify Section 13-d so that medical society compensation committees, when they shall hear and determine all charges of professional misconduct by a physician practicing under the law, that they be vested with the right to subpoena witnesses and records, to issue subpoena *duces tecum* and to administer the oath to all witnesses required in the investigation, hearing, or trial.

6 Consideration will be given to the problem of inspecting, periodically, medical bureaus licensed through county medical societies, and an attempt will be made to provide assistance from the state in enforcing the provisions of the law requiring employers maintaining such bureaus to obtain a license after medical society approval.

7 Steps will be taken to seek state support of the Department of Labor and other interested groups in the passage of these amendments at the next session of the legislature

One who would make even a partial study of the activities of the Workmen's Compensation Committee and the Bureau of our State Society, of the duties imposed upon it by the law itself by the House of Delegates, as well as by the Council, would be amazed not only by the amount of work that has to be done, but also by the extremely specialized knowledge that is needed to do it adequately Reading between the lines of the report, and conferring with the members of this committee, as well as with its director, your Reference Committee has noted the far-reaching character of its activities, the technical character of that work, the intimate knowledge of the last required to perform it properly, and it feels that it is one of the most important functions of the State Society

It has been said that your compensation committee has ever need of more and better public relations. In the larger field of public relations, medicine apparently is in a hostile country The majority of the profession is preoccupied by their professional duties, and we are lulled by a complacency in our

own little accomplishments, leaving a small group of valiant, self-sacrificing men in the state and national organizations to fight for all of us, to combat pernicious propaganda, and to carry medicine's banner even into Congress itself

In the field of public relations that has to do with the Workmen's Compensation Law, it is different, but equally vital Here we already have a law in force Here proper relations with other units of the administration of the law, and with the new Workmen's Compensation Board, are absolutely essential To do this your bureau will have, of course, the continued and energetic cooperation of the officers of the State Society and, what is more important, of the compensation committees of the county societies

It is vitally important, also, that proper relations with labor, with industry, with the insurance carriers, be established and maintained by tact, by cooperation, and, above all, by the confidence and determination that arises from a thorough technical knowledge of our own rights and duties

Your compensation committee has made great strides in this field For instance, they have joined with the insurance carriers in the newly formed "Joint Medical Conference Committee" that will be state-wide in its personnel functions One meeting has already been held This will be a forerunner to the appointment of similar local committees throughout the state, consisting of representatives of insurance carriers and members of compensation committees of the county medical societies that will open a large field for improved relations, and many matters that, in the past, have led to much dispute, can be amicably settled

In addition, Miss Mary Donlon has recently asked your committee chairman to serve on a new Workmen's Compensation Advisory Committee which will meet monthly in New York or in Albany This group will consist of employers and workers, as well as the chairman of your committee, representing medicine This would seem to be a farsighted endeavor to study mutual problems in the interest of good medical care for the injured workman and tend to prevent much ill-advised legislation

Conferences were held with the president and representatives of the New York State Federation of Labor, with a view to bringing about a closer relationship and mutual understanding between the Society and this group in all matters affecting medical care and especially treatment of injured workers under the Workmen's Compensation Law

Meetings were sought and obtained during the past few months with the executive officers of Associated Industries of New York These meetings, already started, give great promise for the future

Miss Mary Donlon, the new chairman of the Workmen's Compensation Board in the Department of Labor, apparently believes that each separate unit having to do with the adequate functioning of the law should be efficient in itself, and should cooperate with each other, that each should be used by the other, that they should respect the motives of each other, that they be made to sit around conference tables to iron out their differences, and to help one another and, if they do not, then she will decide for them All of this to the end that the workingman gets the best care in the world If these are her aims, and we believe they are, she has our blessing and our best wishes

It may be stated here that we are now participating with others in arranging a large dinner to be tendered Miss Donlon on December 12 At this dinner, which will probably be attended by Governor Dewey and other prominent personages including leaders of the medical profession, Miss Donlon will undoubtedly outline her policies

Your Reference Committee believes that your Council Committee and the compensation bureau of the State Society will continue to do everything in their power to win and hold the good will of the Department of Labor, and we are confident that with Miss Donlon this will not be an exhausting task

The fundamental duties of your council committee, however, will continue to be

1 To continually strive to elevate the quality of medical care, both ethically and scientifically, for the injured workman

2 To safeguard the interests of the medical profession under the law

3 To work for ever more harmonious relationship between the medical profession and the other interested parties, including the Department of Labor

Suggestions for better standards, for higher and more exact qualifications for physicians, or even suggestions for disciplinary action, may emanate from your bureau, but it is only in the county societies that they can be translated into action

Your Reference Committee commends the very excellent work done by your committee and its bureau during the past year

Section 114 (*See 64*)

Report of Reference Committee on Report of Council—Part X Abolition of 5 Per Cent Discount to Insurance Carriers on Compensation Bills

DR. LEO F SIMPSON, *Queens* On the resolution introduced by Dr Ezra A Wolff, of Queens County, reading

> "WHEREAS, the 5 per cent discount for payment of bills within thirty days of submission of such bills by physicians for the treatment of patients under the Workmen's Compensation Law appears to be unfair to the physicians rendering the bills, therefore be it
>
> "*Resolved*, that the membership of the Medical Society of the County of Queens, Inc , instruct its delegates to the House of Delegates of the Medical Society of the State of New York to propose the discontinuance of the 5 per cent discount on bills over $15, and in its place recommend to the Commissioner of Labor the payment by insurance companies of 6 per cent per annum interest on all bills which are not paid within sixty days of the date of receipt of such bills "

The Reference Committee approves the resolution calling for the discontinuance of the 5 per cent discount This recommendation appears in the report of the Council Committee and was passed by the House of Delegates last year to be forwarded to the Department of Labor Action awaits a hearing on the fee schedule which is promised for this fall

We do not believe a penalty of 6 per cent per annum is reasonable unless the 5 per cent discount which was intended to facilitate the prompt payment of bills, is not removed Therefore, we approve of the removal of the 5 per cent discount but disapprove the 6 per cent penalty at this time

I move the adoption of the Reference Committee's recommendation

The motion was seconded, and as there was

no discussion, it was put to a vote, and was unanimously carried

Announcement Re Condition of Dr G Scott Towne

SPEAKER BAUER Gentlemen, I have word that Dr Towne has been transferred to the hospital here in Buffalo by Dr Trick, and that he is somewhat improved I think it would be very nice if the House would send a word of sympathy to him and that the Secretary be authorized to send him some flowers

DR. JAMES F ROONEY I so move

DR. GEORGE W KOSMAK I second that motion

SPEAKER BAUER I am sure there is no use calling for a discussion on that Those in favor say "Aye" those opposed, "No " The motion is unanimously carried.

Section 116

Report of Special Committee on Prize Essays

SPEAKER BAUER Dr Charles Gordon Heyd Chairman of the Committee on Prize Essays, both for the Merritt H Cash and Lucien Howe Awards, states no essays were submitted this year worthy of prizes.

Section 117

Notice of Bylaw Amendment to Extend Time of House of Delegates' Meeting

SPEAKER BAUER There is one thing more I want to say before we close that is, I have been a little distressed in this meeting by the tremendous amount of work we have had to do and the inadequate time in which to do it We were terribly rushed this morning, and this business this afternoon of presenting reports while the counting of the ballots was going on was very unsatisfactory In spite of that, we still did not have time for Dr Simpson's report, and although perhaps that does not matter since there is no controversial issue contained in it nevertheless it is not fair and I think we should have some arrangement made by amending our bylaws to rearrange our whole schedule of this meeting A lot of men had to be out of the House yesterday when things were going on because our morning session was delayed beyond the usual time also the dinner last night made it difficult for the committees to meet until late, and it just was not satisfactory We amended the bylaws a few years ago to do away with that Monday night session because that meant three sessions in one day but I feel we ought to amend them again to rearrange the whole schedule so the House will have plenty of time to transact its business, and what is more that the committees will have time to work without having to be out of the House. Therefore, I am giving notice that I am going to submit an amendment on this subject to be printed before the next meeting so it can be acted on next year to rearrange this whole schedule and see if we can not, two years from now, have a more satisfactory arrangement, because I don't think this has been right. I think part of the trouble has been that the meeting was adjourned and we had more work than usual, but nevertheless the work of this House is increasing year by year and we just don't have time enough to do the work in the time allotted Therefore, I give notice now that amendment will be submitted. That is all that is required We don't have to give the details of it. It will be submitted in ample time to be distributed to the House.

Section 118

Thanks to Various Committees and Personnel of State Society and Hotel Statler

SPEAKER BAUER I want to express my thanks to all the reference committees and the chairman particularly who worked so hard on these reports About 75 per cent of the House were on these reference committees.

I also want to express my thanks to the tellers

I think there should be a motion to thank the Committee on Arrangements that made our meeting possible here in Buffalo, and I would like to entertain that motion

DR. JAMES R. ROONEY And I should like to present it. I should like to do it in this manner to extend our sincere thanks to the Committee on Arrangements, to the Erie County Medical Society, of whom we are guests, to the hotel management, which has done a magnificent job and last but not least, to the Speaker for his magnificent acceleration of the enormous load of business that is accumulating on this Society particularly this year, and I would like to add also my own gladness at hearing that he is going to propose this bylaw because if he had not I would have We talked about the matter the other night, and I am glad to have him say it, but I make that as a formal motion that the Secretary be directed to notify the Erie County Medical Society, the Committee on Arrangements, the hotel management, and any of the other organizations in Buffalo that have provided for the accommodation of the delegates and for the magnificent services which they had and with that goes the thanks of the House of Delegates of this Society

The motion was seconded.

DR. HAROLD B DAVISON, *New York* May I add to include one more group in the vote of thanks, and that is the staff of the State Medical Society

SPEAKER BAUER I am sure that will be gladly accepted

The motion was put to a vote, and was unanimously carried

SPEAKER BAUER Is there any further business to come before this session?

(There was no response)

SPEAKER BAUER All committees having reported and there being no further business to come before this House I declare the 139th Session of the House of Delegates of the Medical Society of the State of New York adjourned *sine die.*

(The session adjourned at 2 50 P.M.)

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL *The members of the committee are Oliver W H Mitchell, M D , Chairman (428 Greenwood Place, Syracuse), George Baehr, M.D , and Charles D Post, M.D*

Cayuga County Lecture

PREGNANCY and the Rh Factor" was the subject of a lecture given to the Cayuga County Medical Society on December 20 by Dr Robert C Schwartz, instructor in clinical pediatrics at the Syracuse University College of Medicine This instruction, held at the Auburn City Hospital, is provided through the cooperation of the State Department of Health and the State Medical Society

Rheumatic Fever

POSTGRADUATE instruction, arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York and the New York State Department of Health, was given to members of the Ontario County Medical Society on January 8 in Canandaigua. Dr J G Fred Hiss was the lecturer and his topic was "Rheumatic Fever—Rheumatic Heart Disease" Dr Hiss is professor of clinical medicine at the Syracuse University College of Medicine

Shock Therapy in Psychiatry

THE Value of Shock Therapy in Psychiatry" will be discussed by Dr David J Impastato on January 29 when he speaks before the Nassau County Medical Society at a meeting to be held that evening at 9 00 P M in the MacArthur Auditorium, Mercy Hospital, Rockville Centre, Long Island

Dr Impastato is assistant clinical professor of psychiatry and assistant clinical professor of neurology at the New York University College of Medicine

This instruction is provided by the Medical Society of the State of New York

Dr Vaughan at Saranac Lake

RESULTS and Modern Methods in the Treatment of Anemia" was discussed at a meeting of the Saranac Lake Medical Society, at 8 00 P M , December 19, in the John Black Room, Saranac Laboratory, Saranac Lake

Dr Stuart L Vaughan, assistant professor of medicine, University of Buffalo School of Medicine, was the speaker

This was the second in a series of postgraduate instructions arranged for the Society by the Council Committee on Public Health and Education of the Medical Society of the State of New York

---

COSMETICS CONTAINING HORMONES

Cosmetics containing hormones are advertised nationally and are available everywhere for purchase without a prescription by a gullible public Cosmetics are defined as applications intended to beautify and improve the complexion, skin, or hair They are designed to make a person more attractive, to delay (or perhaps better, to hide) the appearance of the manifestations on the skin of advancing years, to cover defects and, in general, to make the skin softer and more pleasant to look on The addition of hormones, which are physiologically active ingredients derived from endocrine glands or their synthetic duplicates, alters their status and creates a potentially serious situation These beautifying preparations then become active and possibly dangerous and should be classed with certain drugs, serums, vaccines, vitamins, and other biologic products. As such they should come within the jurisdiction of the United States Pharmacopoeial Convention, the Committee on the National Formulary of the American Pharmaceutical Association, or the Council on Pharmacy and Chemistry of the American Medical Association It is significant that none of these authorities have accepted these products

Extravagant claims are made of the glamorous results of such applications, and enormous sums of money in the aggregate are being spent by ill-advised people lured by such advertisements There is, however, no satisfactory evidence that justifies the use of hormone-containing cosmetics for the purpose of local beautifying effects The Federal Food and Drug Administration, as evidenced by a letter from Commissioner Dunbar published in the *New England Journal of Medicine*, is "skeptical of the benefits, if any, which accrue from the local use of these products" He adds, "We have consistently informed manufacturers that because of the uncertainty of the ultimate effect of the use of these products and because of their dubious value we do not look with favor upon their distribution for lay use" On the other hand, sufficient absorption from the injudicious use of estrogen-containing cosmetics to upset normal body activities has been demonstrated. Eller and Wolff* have recently reviewed the evidence concerning the absorption of such preparations In addition, the cancer-promoting properties of estrogenic substances are reasonably well established. Much experimental work must be done to determine all the possible effects a long-term use of such agents in the average human being, and pending such work, it is well that their use be carefully restricted

The physician is seldom consulted regarding the use of cosmetics or their composition He should, however, be cognizant of the fact that there is a lack of convincing data from carefully controlled studies to justify the lurid advertisements of the cosmetic manufacturers

College of Physicians to Resume Annual Meetings

THE American College of Physicians will resume its annual meetings in 1946 and has now definitely chosen Philadelphia, May 13–17, inclusive, at the Philadelphia MunicipalAuditorium

The meeting will be conducted under the presidency of Dr Ernest E Irons, Chicago, Illinois, and the general chairmanship of Dr George Morris Piersol, Philadelphia, Pennsylvania

Ophthalmology Examination Postponed

DUE to transportation difficulties, the examination of the Board, originally scheduled for Los Angeles, January 28–31, has been changed to San Francisco, June 22–25, inclusive, 1946

1946 examinations will also be held in Chicago, January 18–22, New York City about April 10–13, San Francisco, June 22–25, Chicago, October 9–12

Officers for 1946 are

Chairman Edward C Ellett, Memphis, vice-chairman—Georgiana D Theobald, Oak Park, Illinois, secretary-treasurer—S Judd Beach, Portland, Maine, assistant secretary—Theodore L Terry, Boston, and consultant—Walter B Lancaster, Boston

County News

Albany County

The annual meeting of the county society was held in the auditorium of the Albany College of Pharmacy on December 12, 1945, at 8 30 P M Officers elected at this time were as follows president, Raymond G Leddy, vice-president, Homer L Nelms, secretary, Albert Vander Veer, treasurer, Frances E Vosburgh, historian, Emerson C Kelly, board of censors, Arthur J Wallingford, James W Bucci, Conrad A Rissberger, John J Clemmer, and William Milner, delegates to the State Society, Stanley E Alderson, Donald D Prentice, and Raymond F Kircher, and alternates, Jacob L Lochner, Jr , Emerson C Kelly, and Ignatius J Murnane

Allegany County

The annual meeting of the county society was held October 11, 1945, at which time the following officers were elected president, Irwin Felsen, of Wellsville, vice-president, R. O Hitchcock, of Alfred, delegate to the State Society, Lyman C Lewis, of Belmont, and alternate, N H Fuller, of Friendship

Broome County

The annual meeting of the county society was held on December 11, 1945 The officers elected for the ensuing year are president, Victor W Bergstrom, vice-president, J C Zillhardt, secretary, Milton A Carvalho, assistant secretary, R S McKeeby, treasurer, Leonard J Flanagan, and assistant treasurer, J Worden Kane Chairmen of committees are economics, Mark Williams, legislative, Elton R. Dickson, and library, Stuart B Blakely

. . .

Maj Irving Werner, Binghamton physician who went to war in August, 1942, has returned to his home after serving for thirty-five months with the army in the Southwest Pacific *

Cayuga County

The county society held its annual meeting on December 20, 1945, and elected the following officers for 1946 president, C W Bullard, vice-president, R J Thomas, secretary, S J Karpenski, treasurer, L H Rothschild, delegate to the State Society, A K Bates, alternate, B L Cullen, delegate to Seventh District Branch, G P Ross, alternate, N L Woodford, and Board of Censors, C Goodwin, B Cullen, A. Chidester, R Johnson, and Leonard Sincerbeaux

Chemung County

The annual meeting of the county society was held on December 4, 1945, at 8 30 P M The following officers were elected for 1946 president, W T Boland, vice-president, Augustus Hillman, secretary, Earl D Smith, treasurer, M F Butler, delegate to the State Society, Clifford Leet, alternate, George Murphy, trustee, A W Booth, censors, Anna Stuart and F E Woodhouse

Drs Ross Hobler, David Kaplan, J J McConnell, Gerald Connely, Francis Chamberlain, and Donald J Tillou have been discharged from military service and have opened offices for the practice of medicine

. . .

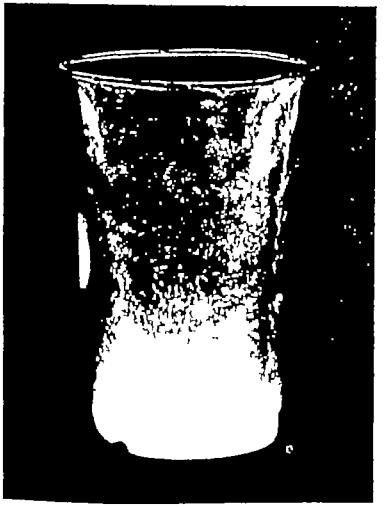
Dr Royal Reynolds, who retired recently as an Army brigadier general after thirty-six years service, will make his home in Elmira and will be associated with Dr Arthur C Smith *

Chenango County

Dr Norman C Lyster, who spent twenty-one months with the 100th Evacuation Hospital in the European Theatre of Operations as chief of the eye, ear, nose, and throat section, reopened his offices in Norwich on November 5, 1945

While in military service Dr Lyster served as a captain in the medical corps *

Clinton County



The annual meeting of the county society was held on November 20, 1945 The following officers were elected for 1946 president, Edwin W Sartwell, vice-president, James J Reardon, secretary-treasurer, Kenneth M Clough, censors, L G Barton, F Ryan, S Mitchell, delegate to the State Society, Leo F Schiff, and alternate, William H Ladue

Following dinner the program included lectures

Three Dutchess County doctors have been discharged from the services and resumed their practice They are Drs Morris J Frank and Morris Schwartz, of Beacon, and John F Rogers, of Poughkeepsie Dr Rogers has returned to the office of honorary deputy fire chief of Poughkeepsie

Essex County

The annual meeting of the county society was held in Elizabethtown on October 16, 1945 The officers elected for 1946 are president, John Breen, Schroon Lake, vice-president, James Walsh, secretary-treasurer, James E Glavin, Port Henry, delegate to the State Society, Joseph A Geis, alternate, Thomas R. Cummins, delegate to the Fourth District Branch, Thomas R Cummins, alternate, Robert H Gray, censors, T J Cummins, R. H Gray, and Albert Hayes

Dr Robert S Kunkel and Dr M E Brickner, both of Gloversville, have recently been discharged from the Army and have resumed the practice of medicine

Jefferson County

The regular monthly meeting of the county society was held on December 13 at 6 30 P M at the Black River Valley Club, in Watertown The program consisted of a symposium on "Sublimation of War Experience in Medicine" Dr Nelson spoke on surgery, Dr Rice discussed medicine, Dr Hamilton, surgery, Dr Sickels, x-ray, Dr L George, communicable diseases, Dr Soults, aviation medicine Each explained how experience in his field could be applied to better practice

Dr H Louis George was recently discharged from the Army and reopened his practice in Watertown on October 24.

Kings County

A stated meeting of the county society was held on November 20, 1945 in the MacNaughton Auditorium. The scientific program consisted of two lectures "The Relationship of Common Baldness to Male Sex Hormone," by Dr James B Hamilton, professor of anatomy, Long Island College of Medicine, Brooklyn, and "Thermal Injuries with Special Reference to the Effects of Heat and Cold on the Respiratory Tract," by Dr Alan R Moritz, professor of forensic medicine, Harvard Medical School, Boston

Madison County

At the annual meeting of the county society the following officers were elected for 1946 president, Felix Ottaviano, of Oneida, vice-president, Richard B Cuthbert, Canastota, secretary, Lee S Preston, Oneida, treasurer, George S Pixley, Canastota, delegate to the State Society, Felix Ottaviano, alternate, Richard B Cuthbert, and member of the Board of Chambers, R. L Cuthbert

Five county physicians have recently been discharged from military service and have resumed their practice Drs E H Carpenter, E G Hixon, F O Pfaff, and A J Zaia have returned to Oneida, and Dr Alvah Morrow has returned to Canastota

Monroe County

The Medical Society of the County of Monroe has announced the return to civilian practice of these doctors who have been with the armed forces

Don K Hutchens, Jacob D Goldstein, Louis A. Goldstein, Julius Rock, William P VanWagenen, Leonard K Stalker, Alvah S Miller, Murray Bratt, Henry C Shaw, Philip M Winslow, and William Madden.*

Montgomery County

At the annual meeting of the county society in December officers for 1946 were elected They were as follows president, Martin F Geruso, Amsterdam, vice-president, Dewey Steffanholzen, Canajoharie, treasurer, Melvin T Woodhead, Amsterdam, secretary, Stella M Partyka, Amsterdam, delegate to the State Society, Robert C Simpson, Amsterdam, alternate, John Brutkus, Hagamen, delegate to the Fourth District Branch, P J. Fitzgibbons, Amsterdam, alternate, Roman Violyn, and censors, C Armstrong Spence, of Amsterdam, Charles Slater, of Fort Plain, and William Seward, of Amsterdam

Nassau County

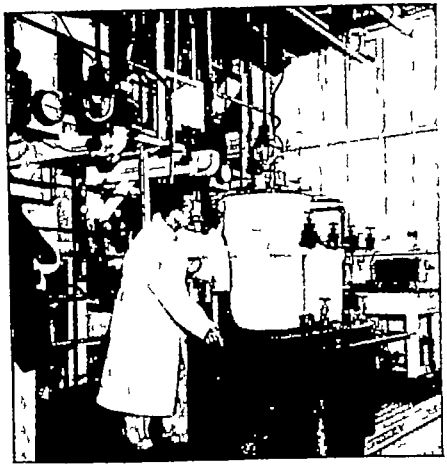
The regular meeting of the county society was held November 27, 1945 in Mercy Hospital auditorium, Rockville Centre The scientific session consisted of a lecture by Dr A Wilbur Duryee, associate clinical professor of medicine, College of Physicians and Surgeons, Columbia University, on "The Management of Acute or Slowly Progressive Arterial Occlusions"

• • •

The following county doctors have been released from military service and have resumed the practice of medicine Dr Abraham Diamond, of Long Beach, Dr Israel Gerberg, formerly of Brooklyn but now practicing in Freeport, and Dr Manfred J Gerstley, of Lynbrook.

New York County

Dr George Baehr, director of clinical research at Mount Sinai Hospital, was elected president of the New York Academy of Medicine at a stated meeting on December 6 He succeeds Dr William Worthington Herrick, who died in June



Dr Baehr returned to active practice in 1944 after having served as chief medical officer of the Office of Civilian Defense Before assuming his Federal post in 1941 Dr Baehr was president of Mount Sinai's medical board He has been active in the American Red Cross for many years and on December 3 was appointed vice-chairman of the executive committee of a newly created Advisory Board on Health Services

Dr J William Hinton, Dr J Burns Amberson, and Dr Alexander T Martin were elected vice-presidents and Dr Condict W Cutler, Jr , and Dr Paul Reznikoff were chosen as trustees to serve five years *

Final stage in the purification of penicillin—the removal of pyrogens by filtration of the penicillin concentrate.

★ ★ ★

Penicillin Merck meets the recognized high standard of quality established for all Merck products. It is subjected to repeated tests and control procedures throughout every step of the production process, and the finished product is assayed, tested, and approved under rigid standards established by the Food and Drug Administration and by the Merck Analytical Laboratories.

★ ★ ★

A GLIMPSE AT THE RECORD

IN 1940 Merck research on antibiotics concentrated on Penicillin.

IN 1941 Merck brought about a reciprocal arrangement between British and American investigators to spur the production of Penicillin in co-operation with the United States and British governments.

IN 1942 Merck supplied Penicillin for the first case of bacteriemia successfully treated with this drug in the United States.

IN 1943 Merck sent shipments of Penicillin to England by air transport for urgent therapeutic use by the United States Army Medical Corps.

IN 1944 AND 1945 Merck produced ever-increasing supplies of Penicillin for our Armed Forces.

AND NOW, Merck production of Penicillin has reached a point where in addition to meeting continuing military requirements, large quantities are being produced for civilian medical needs.

in nineteen of the voluntary and municipal hospitals in New York and one in Jersey City

Dr Rappleye said that these institutions, thirteen of which are voluntary hospitals, joined in the United Hospital Fund, of which he is a trustee, and are co-operating fully in the university effort to provide long-term full-time residency training in all the clinical fields, consistent with available clinical material

In addition, he said, the hospitals are expanding their short refresher courses to accommodate two thousand discharged medical officers during the coming year in more than two hundred different courses in every field of general and specialized practice He predicted that there would be at least five thousand medical officers seeking postgraduate instruction in New York City, "well beyond the capacity of the hospitals and schools to provide for adequately"*

• • •

Dr William M Schmidt, of New York City, former medical director for the New York region of the Children's Bureau, U S Department of Labor, is en route to Europe to supervise the health and medical services on the continent of the Joint Distribution Committee, it was announced early in December by Dr J J Golub, chairman of the Health Committee of the J D C and Executive Director of the Hospital for Joint Diseases

• • •

On November 29, at 8 30 P M, Dr Willard C Rappleye delivered an address on "The Making of the Doctor," at the New York Academy of Medicine

Dr Rappleye discussed the recent developments in medical education and the numerous problems which have arisen because of the very rapid and very radical changes which medical education has undergone in recent decades The subject of Dr Rappleye's talk should be of particular interest to the public, since nothing, perhaps, more directly affects the quality of medical service which the public receives than the education which the doctor receives during his undergraduate period and later

Dr Rappleye's address was the second in this year's series of Laity Lectures devoted to "Medicine Today,"

Niagara County

The regular meeting of the county society was held on November 13, 1945, at 9 00 P M in the Prospect House, Niagara Falls Mr George Farrell, Director of the Bureau of Medical Care Insurance of the Medical Society of the State of New York, spoke on "Present Status of Medical Indemnity Insurance

Oneida County

A number of county doctors have been honorably discharged from the armed services and have resumed their practice Drs Willard H Willis, Louis Dantzig, T Douglas Kendrick, and Roy C Ainsworth have returned to practice in Utica, and Dr M L Rower has reopened his office in Clayville

degree from Tufts College in 1911 He was 56 years old

Julius Frankel, M D, of New York City, died on December 7 in Miami, Florida, at the age of 70 Dr Frankel was famous in the lower East Side for devoting his forty years in medicine to treating the poor Before his retirement in 1935, he was associated with the staffs of Beth Israel, Manhattan General, Samaritan, and St Mark's hospitals He was graduated from Cornell University Medical College in 1900

George R Gould, M D, of Warwick, died on December 14 at the age of 41 He was staff physician at St Anthony's Hospital, in Warwick A graduate of the College of Physicians and Surgeons, Columbia University, he served his internship at St Luke's Hospital in New York He was a member of the Orange County Medical Society, the Medical Society of the State of New York, and the American Medical Association

Brian J Kelly, M D, of Frankfort, died on December 17 at the age of 54 Mayor of the town of Frankfort, Dr Kelly received his medical degree from New York University-Bellevue Medical College in 1915 He was a member of the medical societies of Herkimer County and New York State, and the American Medical Association

Austin Signore Husbands, M D, of Brooklyn, died on October 3, 1944 Dr Husbands was graduated from Meharry Medical College in 1935, and was a member of the Kings County Medical Society, the Medical Society of the State of New York, and the American Medical Association He was 57 years old

Walter Ellwood Kiefer, M D, of Lynbrook, Long Island, died on October 27 He was graduated from the Medico-Chirurgical College of Philadelphia in 1911, and was a member of the medical societies of Nassau County and New York State, and the American Medical Association He was 62 years old

Jacob Lattman, M D, of New York City, died on December 18 after a long illness He was 56 years old Until his retirement several years ago Dr Lattman was assistant physician in the tuberculosis division of the Willard Parker Hospital After receiving his medical degree in 1917 from the College of Physicians and Surgeons, Columbia University, he interned at Bellevue Hospital and later served as a physician at Bellevue and Lenox Hill hospitals He was a physician for many years for the Board of Health and a lecturer on tuberculosis at the College of Physicians and Surgeons, Columbia University He was a member of the medical societies of New York County and State and the American Medical Association

George Mannheimer, M D, of New York City, died on December 10 at the age of 79 Formerly a member of the staff of the New York Infirmary for Women and Children, he received his medical degree in 1890 from the University of Strassburg He was a Fellow of the American College of Physicians, and a member of the Academy of Medicine, the medical societies of New York County and State, the American Medical Association, and the National Tuberculosis Association, and former president of the Rudolf Virchow Medical Society

Charles Harper Montgomery, M D, of the Bronx, died on July 13 Dr Montgomery, who was graduated from McGill University, in Canada, in 1903, was a member of the Bronx County Medical Society, the Medical Society of the State of New York, and the American Medical Association

Carl Tompkins, M D, of Randolph, died on October 25 after a long illness He was 73 years old Dr Tompkins had practiced many years in Buffalo and Medina before retiring several years ago He was a former medical instructor of the University of Buffalo, School of Medicine, from which he received his medical degree in 1901, and had served on the staffs of Buffalo General, Batavia General, and Medina Memorial hospitals He was a member of the Medical Society of the State of New York and the American Medical Association

---

PENICILLIN USED SUCCESSFULLY IN SCARLET FEVER

A successful seven-day treatment of scarlet fever with penicillin was reported on November 14 in the *Journal* of the American Medical Association

The treatment, consisting of injection of 10,000 units of penicillin into the muscles every three hours, is effective in rapidly eliminating the germ-causing infection (hemolytic streptococci) from the nose and throat within forty-eight hours, the report said

Dr Manson Meads, Dr M Eugene Flipse, Jr, Dr Maxwell Finland, and Dr Mildred W Barnes, with the collaboration of Ruth Drew and Alice Northrop, of Boston, studied four groups of 9 patients each who were admitted to the south department of the Boston City Hospital between January and May, 1945

The authors emphasized that their conclusions were "only tentative" because they were based on a "very small number of cases"

Each of the groups of scarlet-fever patients was treated differently Group A was given no sulfonamides or antibiotics, Group B was treated with muscular injections of penicillin, Group C with sulfadiazine taken by mouth, and Group D with nose and throat sprayings with a penicillin solution

Best results were obtained in Group B

The report said clinical results suggested the muscular treatment might "minimize or even eliminate" late complications involving the ear, heart, and joints and dangerous damage done to the kidneys

"Furthermore, should these findings be corroborated on a large scale," the report added, "patients could be discharged after eight or ten days without danger of giving rise to secondary cases or of cases returning with complications"

OPEN SEASON *for* COLDS

During these winter months, colds can well hit a new high in morbidity among a hard working population long on rationed foods.

Relief of exhausting cough is effectively accomplished by administration of LIQUID PEPTONOIDS WITH CREOSOTE, a palatable bronchial sedative that quiets the cough, promotes expectoration and helps check extension of the inflammatory processes. In the early treatment of respiratory symptoms arising from the common cold, prescribe

LIQUID PEPTONOIDS

REG. U.S. PAT. OFF.

WITH CREOSOTE

Each tablespoonful contains 2 minims of pure beechwood creosote and 1 minim of guaiacol combined with peptones and carbohydrates—a unique formula that tends to prevent gastric irritation and eructations.

DOSAGE. For adults, one teaspoonful hourly

SUPPLIED: 6 and 12 ounce bottles.

Health News

New Treatment Due for Scalp Ringworm

Education of parents in preventive measures is urged by the United States Public Health Service in announcing a new method of treatment for ringworm of the scalp that can be applied without keeping children out of school and without the use of x-ray Control of serious outbreaks of this disease in many large cities is expected as a result of this treatment, utilizing two chemicals used in medicine for the first time by the Public Health Service, the Industrial Hygiene Division revealed on December 7

The method is the outcome of a year's experiment at treatment centers set up in schools at Hagerstown, Maryland, in cooperation with the Maryland State Board of Health and the Washington County health authorities

Revealing that a full report will be published soon in the *Journal* of the American Medical Association, the Public Health Service issued its preliminary statement, "because of the large number of inquiries being received from health officers and private physicians for recommended treatment in local epidemics"

Advocating rigid sterilization of hair clippers in barber shops of the community, Dr Louis Schwartz, who directed the Hagerstown survey, revealed that these implements play a leading role in spreading infection.

Blood Bank for Cancer Set Up at Memorial Hospital

Dr Cornelius P Rhoads, director of Memorial Hospital, basic unit of the Memorial Cancer Center, and Mrs Francis J Rigney, commander, Field Army, New York City Cancer Committee, have announced the establishment of a Field Army Blood Bank for cancer patients at the hospital Members of the public as well as members of the Field Army may donate their blood for cancer patients who are unable to pay a professional donor

If blood is given to a patient able to pay, the money received will be placed in the general fund of the hospital, where it will accrue to the benefit of cancer patients Registration of donors will be handled at 2 West 106th Street, the old hospital building, which is also Field Army headquarters Nonmembers of the Field Army who wish to volunteer their blood should telephone to Mrs Louise Sturgis, chairman, Field Army Nursing Aide Division, at ACademy 2-1310

Basil O'Connor Reappointed to Head Red Cross

The reappointment of Basil O'Connor, former law partner of the late President Roosevelt, as chairman of the American Red Cross by President Truman was announced on December 11, 1945 by the White House

In reappointing Mr O'Connor, the President apparently was not influenced by a dispute within the Red Cross during which some officials and members of the organization have charged that his ouster was being sought by a group opposed to his dealings with labor in Red Cross activities

Health Plan Elects O'Dwyer to its Board

Mayor-elect William O'Dwyer was elected on December 19, 1945 a director of the Health Insurance Plan of Greater New York, according to an announcement by Dr Willard C Rappleye, chairman of the board The meeting was held in the office of Mayor La Guardia, chief sponsor of the plan

Although the Mayor-elect was not present, Dr Rappleye said Mr O'Dwyer had endorsed the plan and promised to continue support of enrollment by city employees

Dr Rappleye announced also that Albert Pleydell, Commissioner of Purchases in the La Guardia administration, would be acting business manager of the Health Insurance Plan and that group medical practice units were being organized in six hospitals in Manhattan, Brooklyn, and the Bronx

Pink Proposes State Health Program for All

A voluntary health plan for New York State, including the establishment of locally administered regional health centers to provide medical facilities to all persons, regardless of ability to pay, was proposed on December 11, 1945 by Louis H Pink, president of the Associated Hospital Service of New York and former Superintendent of Insurance for the State of New York

The plan, prepared by Mr Pink for the New York State Commission on Medical Care and presented by him at a hearing at the Hotel Roosevelt before the Joint Legislative Committee on Industrial and Labor Conditions, also presented a supplementary scheme for compulsory payment by employers and employees, similar to the provisions of the law regarding workmen's compensation, if compulsion should be necessary

Explaining that the voluntary portion of the plan was based on the Health Center bill sponsored by the late Governor Alfred E Smith and introduced unsuccessfully into the State Legislature in 1920, Mr Pink told the committee that the scheme is concerned not with compensation, but with the establishment of adequate medical facilities within the reach of all people It would require the formation of a State Health Commission including the Commissioners of Health, Mental Hygiene, and Social Welfare, and five citizens, including at least two physicians

The commission, Mr Pink proposed, would be concerned with the organizing of the health centers, to be financed jointly by grants-in-aid from the Federal government, state and local governments, and civic and voluntary organizations, and with the supervision of locally appointed boards of managers for the centers

In addition, Mr Pink said, the commission would establish state scholarships on a competitive basis in medical schools, and would encourage research and education in the health centers Each center, he stated, would consist of existing hospitals and clinics, with any necessary additional facilities.

While extension of preventive medicine and the provision of medical and hospital care of high qual-

"FEEDING DIABETIC PATIENTS"

A practical booklet that helps your patients help themselves

The Knox booklet, *Feeding Diabetic Patients*, not only helps your patients help themselves, but also saves you time and trouble when you prescribe for such patients It contains

- A clear outline of principles of diabetic feeding written in simple language for the layman.
- Practical tables of food composition
- Sample diabetic menus
- 33 pages of appealing recipes.
- Examples showing how Knox Gelatine (which is *all protein*, contains no sugar) helps to give variety and volume to menus, without breaking your dietetic rules for diabetic patients.

These helpful booklets are entirely free — a part of the Knox service to the medical profession. Clip the coupon below and send for as many copies as you can use

[Continued from page 212]

ity through such centers might eliminate any need for compulsory health plans, Mr Pink said, a law similar to the compensation law now in effect would be the best solution if compulsion should be necessary He recommended that in such a case, employers would be required to divide the cost of medical protection with the state for employees with family incomes under $2,100, and to divide the cost with employees in cases where family income is under $3,500 Such a plan, he said, would not interfere in any way with local initiative or existing medical methods

Several physicians also spoke at the hearing before the committee, which is considering the application of unemployment benefits to persons who are kept from work by illness

Doctors Urge Stricter Curbs on Sleep Drugs

Five recommendations aimed at stopping the illegal sale and distribution of sleeping pills, which caused at least 110 deaths in New York City in the first eight months of 1945, were submitted on November 29 to Dr Ernest L Stebbins, Health Commissioner, by the Committee on Public Health Relations of the New York Academy of Medicine

The committee's recommendations are directed at control of both wholesale and retail distribution of barbiturates, with emphasis on the limitation of prescriptions and maintenance of complete records by manufacturers and distributors of sleeping pills

Under the committee's proposals, no prescription for barbiturates would be filled more than once, unless a physician indicated that it should be refilled, and then only if the physician indicated the minimum interval between renewals and the total number of renewals permissible All prescriptions would expire six months after being issued

In addition, the recommendations would prevent a pharmacist from revealing the contents of a prescription or furnishing copies of it to a patient

Records of the amount, date, and the name and address of each patient receiving prescriptions would have to be maintained by any dispensing physician, dentist, or veterinarian for a period of two years, according to the committee's proposals, and each manufacturer, wholesale jobber, or wholesale distributor would be required to keep records regarding all receipts and distributions of barbiturates Retail sources would be controlled by complete data of the same type kept by pharmacists

Finally, the committee recommended that it be made illegal for any person to sell, barter, exchange, or give away barbiturates except in filling prescriptions or orders from licensed pharmacies

The need for more drastic control of the sale of sleeping pills was made evident in figures disclosed by Dr Thomas A. Gonzales, chief medical examiner According to Dr Gonzales, the number of deaths in New York City directly attributable to overdoses of barbiturates, either by accident or by intent, has risen by nearly 400 per cent in the last eight years The rate rose steadily from only 30 during 1937 to 95 last year, and up to 110 from January 1 to August 24 of 1945

In each case, the death resulted from an overdose of commonly used barbiturates, although in one instance the victim died from an accident suffered while he was under the influence of a large dose

The problem of controlling the distribution and sale of barbiturates was discussed at a conference held by Commissioner Stebbins December 7 Representatives of the medical, dental, and veterinary professions and pharmacists, retailers, and wholesalers of drugs were invited

Conference on Fertility to be Held February 1 and 2

The annual conference on fertility of the National Committee on Maternal Health will be held at the Hotel Commodore, in New York City, on February 1 and 2, 1946

Two major topics will be considered "Detection and Induction of Ovulation," and "Sperm Biology," with particular reference to sperm migration in relation to the female genital tract

The speakers will include investigators from the fields of animal husbandry and from clinical and laboratory studies related to man

A P H A to Accredit Schools of Public Health

The Committee on Professional Education of the American Public Health Association, of which Dr William P Shepard is chairman, is undertaking a program for the accreditation of schools of public health The initiative for this urgent project came originally from the Association of Schools of Public Health, in a resolution adopted in April, recommending that the A P H A "create a properly constituted accrediting body to carry forward progressively a list of universities qualified with regard to program, personnel, and facilities, to offer adequate courses leading to the degrees of Master of Public Health, Doctor of Public Health, and the Diploma in Public Health" This was followed closely by a similar request to the Association from the Surgeon General's Committee on Postwar Training of the Public Health Service

The Association now announces the inauguration of the project with funds made available through the generosity of the Commonwealth Fund, and with the appointment of Professor C -E A Winslow of New Haven, Connecticut, as the counsellor in charge of the investigative work He will be aided by persons experienced in the administration of health departments, chosen from various localities

Accreditation will be based on a visit to the institution by a representative of the committee and other data A copy of the report of the staff will be submitted to the administrative head of the institution before submission to the Committee on Professional Education, and the committee will provide a hearing to him or his representative if desired Decisions of the committee will be finally subject to approval by the Executive Board of the Association In certain cases, provisional accreditation may be granted, subject to the fulfillment of specified requirements within a stated time

It is planned to concentrate first on the basic one year of training qualifying for the degree of Master of Public Health (in Canada, Diploma of Public Health) At the same time, or subsequently, a list of institutions will be accredited for the more advanced degree of Doctor of Public Health, perhaps involving specialization in particular administrative or clinical fields

At a later date the program will be extended to consider facilities for M P H training adapted to particular specialties such as health education, to such general university degrees as the M S and the

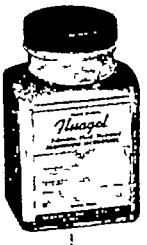
SCIENCE OR SORCERY ?



Oh, the gnawing, nauseous, digestion-mocking torment of a peptic ulcer! And the gratitude of its victim released from the wearisome pain and back to a full diet! His doctor is viewed as some thing between a scientist and a sorcerer

Aluminum hydroxide treatment, so superbly exemplified in Fluagel helps to that end. In fact, Fluagel is something of a sorcerer itself! It overcomes gastric hyperacidity by adsorbing hydrogen ions onto its colloidal particles. Yet it does not affect the acid base balance of the blood.

In fixing hydrochloric acid with aluminum hydroxide, oxychlorides are formed. There is no rebound of acids. Because of the mild astringency of these substances bleeding tends to be arrested, healing of ulcers promoted.

The alkaline secretions of the intestine reconvert the oxychlorides to insoluble aluminum compounds. The chloride ion, being soluble, is reabsorbed into the blood stream. The aluminum compounds are excreted.

Your Breon technical service man will tell you other interesting things about *Fluagel, the fluid aluminum hydroxide*

Fluagel is supplied in 10 ounce glass jars.

Ph D , which are given without specific designation but with specialization in basic areas related to public health (such as bacteriology or statistics), to specialized degrees in engineering and other fields related to public health, and to administrative areas suitable for practical field training before or after the basic M P H year

Grants-in-Aid Recommended by Cancer Council

Dr Thomas Parran, Surgeon General of the U S Public Health Service, Federal Security Agency, has announced that eight Federal grants-in-aid totaling $42,040 94 to further the study of cancer have been recommended by the National Advisory Cancer Council

The two largest grants, $10,000 each, will go to Washington University, in St Louis, Missouri, for a study of the effect of radioactive phosphorus on leukemia, polycythemia vera, and various malignant diseases, and to Memorial Hospital for the Treatment of Cancer and Allied Diseases, in New York City, for metabolic studies in patients with gastric cancer Others will include $4,700 to the University of Minnesota, for a study directed at identifying "precursor groups" of patients in which cancer of the stomach is developing, $5,000 to Yale University, for a study of steroids and enzymes in cancer, $3,600 to the University of Southern California, at Los Angeles, for a study of chemical characterization of split-protein products from the blood of cancer patients, $2,640 94 to Jeanes Hospital, in Philadelphia, for a study of variations of the golgi apparatus in human neoplastic diseases, $1,100 to Meharry Medical College, Nashville, Tennessee, for a continuation of investigations and follow-up work at the George W Hubbard Hospital, and $5,000 to Syracuse University for chemotherapeutic studies in cancer

The National Advisory Cancer Council was created by Congress to advise the Surgeon General of the Public Health Service on all phases of cancer One of its duties is to review and make recommendations on applications from institutions and individuals for grants-in-aid for cancer research During the war, applications for grants were few in number, but it is expected that they will increase rapidly as scientists are released from the armed forces and from research projects connected with the war effort

Members of the National Advisory Cancer Council are Dr James B Murphy, Directory of Cancer Research, Rockefeller Institute, New York City, Dr A. Baird Hastings, professor of biologic chemistry, Harvard University, Dr George M Smith, Director, Anna Fuller Fund, Yale University Medical School, Dr Sherwood Moore, Director, Mallinckrodt Institute of Radiology, Washington University, St Louis, Dr Frank E Adair, President of the American Cancer Society and Executive Officer of Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York, and Dr A. C Ivy, professor of physiology, Northwestern University Medical School

Army Establishes Seven Centers for Tropical Skin Disease

Establishment of seven centers specializing in the treatment of tropical skin disease has been announced by Maj Gen Norman T Kirk, Surgeon General of the Army

The centers, it was explained by Maj Clarence S Livingood, of Philadelphia, Consultant in Dermatology to General Kirk, will be devoted to the care of men returned from overseas, particularly the Pacific areas The number of beds involved was not made public, as the program envisions an elastic setup capable of being expanded or contracted as the need arises

The centers will be at Wakeman General Hospital, Camp Atterbury, Indiana, Brooke General Hospital, Fort Sam Houston, Texas, Moore General Hospital, Swannanoa, North Carolina, Harmon General Hospital, Longview, Texas, and in the U S Army General Hospitals at Camp Edwards, near Boston, Massachusetts, Camp Butner, near Durham, North Carolina, and Camp Carson, near Colorado Springs, Colorado

Report on E M I C Program

A million wives and infants of servicemen have been or are being cared for under the emergency maternity and infant care program, the Children's Bureau, U S Department of Labor, announced on October 31, 1945

Of these million cases, some 650,000 represent babies born, 250,000, babies on their way, and 100,000, sick infants Doctor, hospital, and nursing bills for all of them have been or are being paid out of the $100,000,000 "stork fund" appropriated by Congress at various times during the two and one-half years in which the program has been in operation

Facts about the program, brought out in the Children's Bureau accounting, show that

The "stork bill," on the average is something under $100 a baby However, when the mother was dangerously ill and needed medical, hospital, and nursing care, bills have, in some instances, run well over $1,000 The cost of caring for a sick infant averages $65 Sometimes, though, bills run much higher

Nine out of ten women cared for under this program have their babies in hospitals—"the safest place for a baby to be born " In the population as a whole, seven births out of ten take place in hospitals The mothers, by and large, are young A high proportion are having their first babies A large number of servicemen's families have had their second baby under the program, a few applications for care for a third have been reported By far the largest lot of these newcomers were born in New York and California, with Pennsylvania, Texas, and Illinois claiming the next largest numbers All of the States have a considerable number, and even Alaska, Puerto Rico, and Hawaii make a showing No residence requirement has to be met The care is given wherever the serviceman's wife or child happens to be, and if a move is made, the case is transferred

These babies represent many nationalities and races Some of the fathers are "nationals" of other countries, as, for instance, Austrians serving in the American armed forces Included, too, are babies whose foreign-born mothers have married servicemen overseas Maternity bills are paid by Uncle Sam only for babies born in this country, but babies brought here from overseas become eligible for care throughout their first year

Applications are still being received at the rate of

35,000 a month A considerable falling off in the number under Uncle Sam's care is expected soon, the Children's Bureau states, but "the end is not yet" The program will run until such date as Congress sets for its termination, and after that care will be completed for all cases then authorized, not only for the mother, throughout pregnancy and childbirth, but also for the infant throughout his first year of life

Veterans' wives and infants can be cared for, provided that the wife became pregnant while the serviceman was in one of the eligible grades, that is, in one of the four lowest pay grades of the Army, Navy, Coast Guard, and Marine Corps, or was an aviation cadet Moreover, even if the wife was not taken care of under the program, the baby can be cared for if it can be established that the father was in one of the eligible grades during the wife's pregnancy or the child's first year of life In all cases the veteran must have been honorably discharged

Efforts Made to Combat Rheumatic Fever

An estimated half million children have or have had rheumatic fever, and among the school-age group, the 5- to 14-year-olds, it kills more children than any other disease, more even than pneumonia and influenza and more than tuberculosis In an effort to combat this disease by getting the facts about it to the public, the Children's Bureau, U S Department of Labor, has just issued a pamphlet setting forth what is known about rheumatic fever and what can be done to get it under control

"Doctors cannot do the job alone," says Dr Betty Huse, the Bureau's specialist in rheumatic fever "This disease, which takes such a terrible toll in terms of individual suffering and strain on family life, cannot be controlled until the facts about it are known to parents, teachers, social workers, public-health nurses, and all others responsible for the care and protection of children"

New Synthetic Used on Four Types of Anemia

A new enemy of four types of anemia has been discovered, researchers at the University of Cincinnati College of Medicine said on November 30

It is known as synthetic folic acid and is a member of the B-complex vitamin family

Dr Tom D Spies, associate professor of medicine at the college, who reported "definite possibilities" in this direction only a month ago, said the synthetic was beneficial in the treatment of the anemia of pregnancy, nutritional macrocytic anemia, Addisonian pernicious anemia, and the macrocytic anemia of pellagra

A detailed account of studies made at the university's nutritional clinic, which Dr Spies directs at Hillman Hospital, Birmingham, Alabama, appears in the December issue of the *Southern Medical Journal*

"Synthetic folic acid ultimately may be found more effective than the commonly used liver extract in the treatment of macrocytic anemia," says Dr Spies in the *Journal* account

"The synthetic stimulates the manufacture of red blood corpuscles whether it is administered by mouth or injection, and responses to treatment paralleled those afforded by liver extract

"Clinical changes were rather dramatic," Dr Spies says "Patients reported feeling better between the third and fifth days A tremendous increase of appetite in most of them and remarkable weight gains in a few were noted"

Aids Hay-Fever Patients

Good results with a chemical attack on hay fever, asthma, migraine, and other allergic conditions were reported by Dr W Merritt Ketcham, of Kansas City, Missouri, at the meeting in Cincinnati of the Southern Medical Association

After one to six injections of the chemical, ethylene disulfonate, patients were relieved of most or all of their symptoms and have remained well for the six to eighteen months since the treatment was given, he said

The idea for this chemical attack on hay fever and kindred ailments was developed by a group of British and Belgian scientists They believed that the primary cause of allergy was a "departure from normal in the chemistry of cellular metabolism involving the absence of certain catalysts of coenzyme activity"

PSYCHOSOMATICS

Before the second World War we had not entirely failed to realize that an appreciation of the power of the intellect over our more earthy functions is no new idea, regardless of the enthusiasm of the neopsychosomatists

John Hunter proclaimed his life to be in the hands of any man who dared annoy him, followers of the cult of voodoo will lay themselves down and die if they so much as think that the witch doctors are after them, and a combat soldier in any war has known that no intestinal pathogen is necessary to produce an attack of uncontrollable diarrhea Any radio listener, indeed, who has been unable to avoid suffering at the sound of a warbled commercial plug while waiting for his favorite commentator knows how these silly symphonies of the air may inspire in some of their hearers feelings of the blackest melancholy and, in others, those of incipient nausea

It is something to be aware of the psychic stimuli that can erupt at the somatic level, when we can control them we may indeed know the peace that passeth understanding —*N England J M, May 10, 1945*

Control of Barbiturates

Report by the Committee on Public Health Relations of the New York Academy of Medicine

Because of the reported growth of illicit trade in barbiturates and the increase in accidental poisonings and suicides by these drugs, Dr Ernest L. Stebbins, the New York City Commissioner of Health, has requested the judgment of the Committee on the desirability of extending restrictive measures regarding their sale and distribution He submitted to the Committee a draft of the proposed regulations which were drawn up in cooperation with the New York office of the Federal Bureau of Narcotics.

The Committee studied the problem and the suggested proposals and is of the opinion that, from the point of view of public health, the large increase in the consumption of barbiturates warrants stricter measures of control over their sale and distribution. The suggested extension of control however, should not operate to interfere with the freedom of physicians in their practice, rather it should aim to guard against misuse by the dispenser and the user

The following comments and recommendations with regard to the proposed relations are herewith submitted

1 (*a*) The proposal of the Department of Health for a blanket prohibition on refilling prescriptions is impractical because the treatment required in certain conditions makes renewals necessary These renewals however, should be properly safeguarded. Otherwise an unnecessary financial hardship is imposed upon the patient who must return often to the physician to obtain a new prescription.

The alternative of permitting the patient to obtain a large supply of barbiturates on one prescription is considered undesirable for two reasons the patient with a large supply could easily overdose himself, and, second, some persons might be tempted to sell part of their supply to the black market. Regulation by health authorities of the amount of barbiturates obtainable on any one prescription is also considered unwise.

The proposed regulation 1 (*a*) should therefore read as follows

Refilling Prescriptions.—Prescriptions shall be filled only once unless the physician indicates on the prescription that it may be refilled. Original prescriptions only shall be refillable. If refilling is authorized, the physician shall indicate the minimum interval between renewals, and the total number of renewals. If the physician states that he wishes the prescription to be refilled but fails to indicate the interval the pharmacist shall not refill the prescription

No prescription containing a barbiturate shall be refillable for more than six months after the date of issuance.

The directions for refilling may be written in English or in Latin or its corresponding abbreviation (Repetatur quusque 10 dies, or R-Q-10-D)

(*b*) The proposal that pharmacists should never issue copies of prescriptions is also considered impractical. The contents of prescriptions, however should not be revealed by the pharmacists to the patients, but physicians desiring to know the previous treatment accorded new patients should be permitted to obtain such information. The proposed regulation 1 (*b*) should, therefore, be amended to read

Copies of Prescriptions.—Pharmacists shall not reveal the content or furnish copies of prescriptions to patients.

(*c*) The Committee is in agreement with the proposed regulation 1 (*c*), which in substance provides that

Information on Prescriptions.—A prescription issued by a physician, dentist, or veterinarian shall be dated and signed on the date when issued, and shall bear the full name and address of the patient, and the name address, and narcotic registry number of the physician dentist, or veterinarian. Prescriptions shall be written in ink or with indelible pencil, or be typewritten. Physicians shall personally sign these prescriptions.

(*d*) The suggested prohibition against filling telephone prescriptions for barbiturates is considered impractical Illicit trade is unlikely to benefit to any appreciable extent by fraudulent telephone calls. By requiring the pharmacist to report to the proper authorities the nonreceipt of a prescription within seventy two hours, negligence or fraud can be established without the need of restrictions interfering with the legitimate practice of medicine. The following regulation is therefore, recommended

Telephone Orders.—Physicians may, in an emergency obtain limited quantities (not more than six average doses) of barbiturates on telephone order provided they furnish the pharmacist with a written prescription within seventy two hours If the pharmacist fails to receive the written prescription he shall report the fact to the Department of Health

2 The Committee is in agreement with the proposed regulation 2, which in substance reads

Dispensing by Physicians—Records.—The physician, dentist, or veterinarian who dispenses or distributes any barbiturate to a patient shall keep a record of such drug dispensed or distributed showing the amount dispensed or distributed the date, and the name and address of the patient to whom such drugs are dispensed or distributed. Such records shall be kept for a period of two years from the date of dispensing or distributing such drugs, subject to inspection.

The Committee suggests that the ordering of barbiturates by physicians for office use should be done on blanks or forms similar to those used for narcotic drugs

3 The Committee is in accord with the proposed regulation 3 except for an addition to the effect that unusually large orders (to be defined under the Sanitary Code) from retail pharmacists within the City be reported by the wholesalers or manufacturers to the proper bureau of the Department of Health. Such reporting will aid in the control of illegitimate trade. Regulation 3 thus would read

Wholesalers' Records.—Each manufacturer, wholesale jobber or wholesale distributor shall maintain a record which shall be available for inspection at all times of the amounts of barbiturates received and the amounts of barbiturates distributed or sold by him. An inventory of the amount of barbiturates on hand at the time of the effective date of this regulation shall be prepared within a period of two months after the effective date of the regulation. The records shall indicate the dates and names and addresses of persons from whom the barbiturates are purchased, and the dates and names and addresses of persons to whom the barbiturates were sold or distributed. Such record shall be kept on

file for a period of two years Unusually large orders (to be defined under the Sanitary Code) from retail pharmacists within the City shall be reported to the proper bureau of the Department of Health.

4 Since a great many proprietary medicines contain barbiturates and since 20 to 25 per cent of doctors' prescriptions also contain such drugs, the keeping of special records of purchase by retail pharmacists would entail an enormous bookkeeping task.

The proposed requirement for an inventory is considered too great a hardship to impose on the druggists It is, therefore, suggested that the pharmacist be required only to keep a file of the bills of purchase

It is further recommended that the Sanitary Code require the inclusion of proprietary medicines in such a file if they contain barbiturates in more than a minimum pharmacopeial dose Regulation 4 would then provide

Pharmacists' Records —Pharmacists shall have available for inspection all bills pertaining to the purchase of barbiturates and indicating the amounts purchased, the dates, and names and addresses of persons from whom the purchases were made

Every time a prescription containing a barbiturate is refilled the date and the amount dispensed shall be noted on the back of the prescription or in a separate file.

5 The proposed regulation 5 is approved, with the elimination of the word "possess" Manufacturers and wholesalers possess large stocks of these drugs in anticipation of the demand, and it should be legal for them to keep such stocks The regulation should therefore read

Illegal Possession of Barbiturates —It shall be unlawful for any person to sell, barter, exchange, or give away any barbiturates except in the course of filling a prescription of a duly licensed physician, dentist, or veterinarian or filling of an order by a wholesaler, manufacturer, or jobber to a duly licensed pharmacy

The Committee suggests, however, that physicians should not be prohibited from buying barbiturates directly from a manufacturer, wholesaler, or jobber Physicians should likewise have the right to receive from manufacturers new preparations for experimental use with patients

A waiting period of two months should be permitted after the effective date of the enactment of these regulations before the provisions applying to refilling prescriptions are enforced. This respite will give physicians time to acquaint their patients with the new restrictions and to make the necessary adjustments

The Committee is of the opinion that consideration should be given by the Department of Health to the desirability of regulating the sale and distribution of the monoureides and other sedatives not classified as barbiturates

Statement Prepared by the Pneumonia Technical Advisory Committee* to the New York City Department of Health

The Pneumonia Technical Advisory Committee to the Department of Health of the City of New York is concerned because the rapid rise in the incidence of respiratory disease at this season of the year is expected to be followed by an increase in the incidence of pneumonia The Committee is greatly disturbed by the limited available supply of penicillin for the teatment of the expected number of cases of pneumonia and urges the medical profession to curb the waste of penicillin which is now occurring That waste is caused by

(*a*) The use of penicillin for the prophylaxis and treatment of diseases for which it is obviously not indicated

(*b*) The use of penicillin for the continued treatment of patients long after any effective therapeutic benefit might be expected

(*c*) The use of oral preparations of penicillin, which require from three to six times the parenteral dosage, and where absorption from the gastrointestinal tract is uncertain

As a corollary to this situation, the Committee also deplores the present tendency of practicing physicians to treat patients with chemotherapeutic agents without making any attempt to determine the bacteriologic cause of the disease It is emphasized that the indiscriminate treatment of patients without bacteriologic diagnoses may well lead to the death of patients who otherwise might be cured Examples of these are Staphylococcal pneumonia complicating influenza requires very large dosage of penicillin if cure is to be effected, streptococcus infections due to sulfonamide-resistant strains of streptococcus hemolyticus will not respond to sulfonamide-drug therapy, pneumococcal pneumonias require parenteral treatment if recovery is to be assured The Bureau of Laboratories of the Department of Health is prepared to give service in bacteriologic diagnosis in the diagnostic laboratories at 125 Worth Street, WOrth 2-6900, Ext. 527 Specimens of sputum should be sent by messenger in sterile wide-mouthed bottles A report will be made by telephone of any positive findings as soon as the examination is completed Pneumococci can frequently be identified and typed within one or two hours Staphylococcus aureus and streptococcus hemolyticus can usually be reported within twenty-four hours

The Committee recommends that whenever there is a clinical or bacteriologic indication that a patient is suffering from a disease for which penicillin is known to be effective, treatment with penicillin in adequate dosage parenterally be started immediately It also recommends that the bacteriologic cause of the disease be determined at the earliest possible moment and that the treatment of the patient be continued or discontinued in accordance with the bacteriologic findings and clinical developments

The danger of the development of penicillin-resistant micro-organisms is favored by the indiscriminate use of penicillin in inadequate dosage

In certain hospitals the waste of penicillin has been prevented and thousands of dollars have been saved by the delegation to a competent physician or committee the responsibility to survey the use of penicillin at the hospital, to recommend to the staff how existing wastes may be prevented, and to assist

the medical board and administrator of the hospital in exercising continuous control

It is imperative that the limited supply of penicillin be husbanded and used only parenterally and only for those diseases in which the drug can reasonably be expected to be effective, and that its administration be discontinued as soon as possible If this policy is not followed, it is likely that physicians will not have penicillin available to treat the diseases for which penicillin is the essential therapeutic agent

There is attached a list of diseases for which penicillin as indicated and contraindicated, as prepared by the Committee on Chemotherapeutic Agents of the National Research Council and the United States Food and Drug Administration (J A.M A. 128 16, 1161 (Aug 18) 1945)

INDICATIONS AND CONTRAINDICATIONS FOR THE USE OF PENICILLIN*

Group I Indications

1 All staphylococcic infections with and without bacteremia acute and chronic osteomyelitis, carbuncles—soft tissue abscesses, meningitis, cavernous or lateral sinus thrombosis, pneumonia—empyema, carbuncle of kidney, wound infections—burns, and endocarditis

2 All cases of clostridia infections gas gangrene and malignant edema

3 All hemolytic streptococcic infections with bacteremia and all serious local infections cellulitis, mastoiditis with intracranial complications, i e , meningitis, sinus thrombosis, pneumonia and empyema, puerperal sepsis, peritonitis, and endocarditis

4 All anaerobic streptococcic infections puerperal sepsis and localized infections elsewhere

5 All pneumococcic infections of meninges, pleura, or endocardium, and all cases of sulfonamide-resistant pneumococcic pneumonia

6 All gonococcic infections

7 All cases of anthrax

8 All cases of chronic pulmonary suppuration in which surgical treatment is contemplated

9 All meningococcic infections failing to respond to sulfonamides

10 All cases of bacterial endocarditis due to susceptible organisms

11 Erysipeloid (swine erysipelas)

12 Vincent's infection

13 Prophylactic use in prevention of possible secondary infections following tonsillectomy and tooth extraction in patients with a history of rheumatic fever or in rheumatic heart disease, in congenital heart disease, and in other conditions in which secondary infection may occur (infected teeth, tonsils)

Group II Indications

Penicillin has also been found to be an effective agent in the following diseases, but its position has not been definitely defined and will require additional experimental work (1) syphilis, (2) actinomycosis, and (3) diphtheria, in conjunction with antitoxin

Group III Conditions of Questionable Value

Penicillin is of questionable value in mixed infections in which the predominating organism is of the gram-negative flora—i e (1) ruptured appendix with peritonitis, (2) liver abscesses, (3) urinary-tract infections due to Escherichia coli, and (4) ratbite fever due to Streptobacillus moniliformis

Group IV Conditions in Which Penicillin Is Ineffective

(1) All gram-negative bacillary infections typhoid—paratyphoid, dysentery, Escherichia coli, Hemophilus influenzae, Bacillus proteus, B pyocyaneus, Brucella melitensis (undulant fever), Pasteurella tularensis (tularemia), and Friedländer's bacillus, (2) tuberculosis, (3) toxoplasmosis, (4) histoplasmosis, (5) acute rheumatic fever, (6) lupus erythematosis, diffuse, (7) infectious mononucleuosis, (8) pemphigus, (9) Hodgkin's disease, (10) acute and chronic leukemia, (11) ulcerative colitis, (12) coccidioidomycosis, (13) malaria, (14) poliomyelitis, (15) blastomycosis, (16) nonspecific iritis and uveitis, (17) moniliasis, (18) virus infections, and (19) cancer

* Abstracted from Keefer, C S , Herwick, R. P , Van Winkle Jr W , and Putnam, L E J A M A 128 1161 (Aug 18) 1945

HOPE FOR DENGUE VACCINE

Hope that vaccination against dengue, or "breakbone fever," may be achieved appears in a report by Lt Col Albert B Sabin and Capt R Walter Schlesinger, of the Army Epidemiological Board and the Children's Hospital Research Foundation (*Science*, June 22)

Dengue, though not fatal, is a painful, very weakening disease spread by the same mosquitoes that carry yellow fever It has occurred in the southern part of the United States and there have been outbreaks in New Guinea and Hawaii Because of the disability it causes through its weakening effect, it could be a problem to an army fighting in regions where it is prevalent

Inmates of the New Jersey State Prison, who volunteered for the studies, have been given immunity to this disease by injections of dengue virus which had been propagated in mice The feat of establishing the virus in mice has never before been accomplished although a number of attempts have been made

The virus becomes modified by transmission from one mouse to another, so that it causes a progressively less severe disease The volunteers from the state prison actually got, along with their immunity to dengue, a mild attack of it It was no more severe, the scientists report, than the reaction following typhoid vaccination and consisted of fever with or without headache and sickness for twenty-four hours or less A marked, extensive rash, which is one of the symptoms of dengue, also followed the immunizing dose of the virus

Evidence that the virus gave protection against dengue came when the volunteers failed to get the disease after being bitten by mosquitoes carrying the virus When four unprotected volunteers were bitten by mosquitoes from the same infected lot, they all developed typically severe unmodified dengue Ideally a vaccine gives protection against a disease without producing a mild attack of it and such a vaccine for dengue may yet be produced The modification of the virus by passage through mice has already become so marked, the scientists report, that this virus "could be used as a vaccine for the production of immunity against dengue "—*Science News Letter, June 30, 1945*

IDEALLY EQUIPPED BY NATURE TO PROVIDE RESTORATIVE CARE

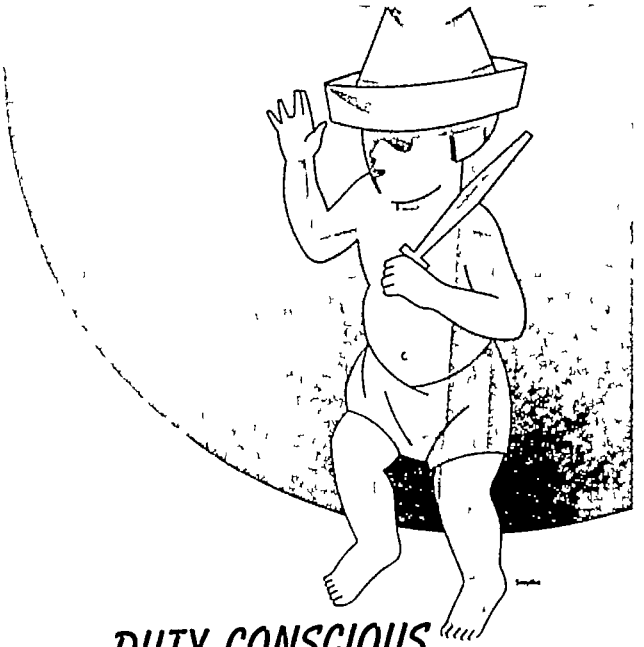
Unsettled times like these bring the overburdened physician more than the normal number of patients suffering from chronic disorders of a cardiac, vascular or rheumatic nature

Here at the Spa, in superb plant facilities placed in a restful setting of great natural beauty, your patient will find the restorative care he needs to prepare him for the full benefit of your continued medical direction

Under regimens of treatment which you yourself recommend, your patient, relaxed in mind and body, draws a full measure of improved health from the Spa's naturally carbonated mineral waters

Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Secure in the knowledge that your instructions for his care will be faithfully carried out, you find needed relief from your overburdened practice



THE SARATOGA SPA

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here. After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still lie ahead

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

For professional publications of the Spa, and physician's sample carton of the bottled waters, with their analyses, please write W S. McClellan, M D , Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

DUTY CONSCIOUS

Equally Effective in Constipation Colitis Diarrhea

Zymenol Contains Pure Aqueous Brewers Yeast (no live cells)

Zymenol makes the bowel duty conscious by maintaining normal intestinal content through Brewers Yeast Enzymatic Action* and aiding restoration of normal intestinal motility with Complete Natural Vitamin B Complex.*

Natural urge to defecate is re-established without cathartics, artificial bulkage or large doses of mineral oil.

Economical teaspoon dosage avoids oil leakage and does not affect vitamin absorption

Write for FREE Clinical Size

More pleasure to you, Doctor!

THREE nationally known research organizations recently reported the results of a nationwide survey to discover the cigarette preferences of physicians and surgeons

Physicians all over the United States were asked the simple question "What cigarette do you smoke, Doctor?" The question was put solely on the basis of *personal preference as a smoker*

The thousands and thousands of answers from these physicians in every branch of medicine were checked and re-checked The result

More physicians named Camel as their favorite smoke than any other cigarette And the margin for Camels was most convincing

Certainly the average physician is busier today than ever before and is deserving of every bit of relaxation he can find in his day by-day routine a cigarette now and then if he likes And the makers of Camels are glad to know that physicians find in Camels that extra margin of smoking pleasure that has made Camels such a favorite everywhere

According to this recent nationwide survey

More Doctors Smoke Camels

than any other cigarette

"The hormone of the mother"

Progesterone is the hormone of the mother and is indispensable for normal reproduction and gestation Administered as PROLUTON by injection it helps maintain pregnancy threatened by miscarriage due to insufficient maternal hormone

PROLUTON

In the presence of a history of habitual abortion PROLUTON is frequently administered prophylactically as soon as the diagnosis of pregnancy is established Four out of five women so treated are carried safely to term [1 2]

PRANONE (anhydrohydroxy progesterone), the orally active form of corpus luteum hormone, may be substituted for PROLUTON where oral therapy will serve most conveniently

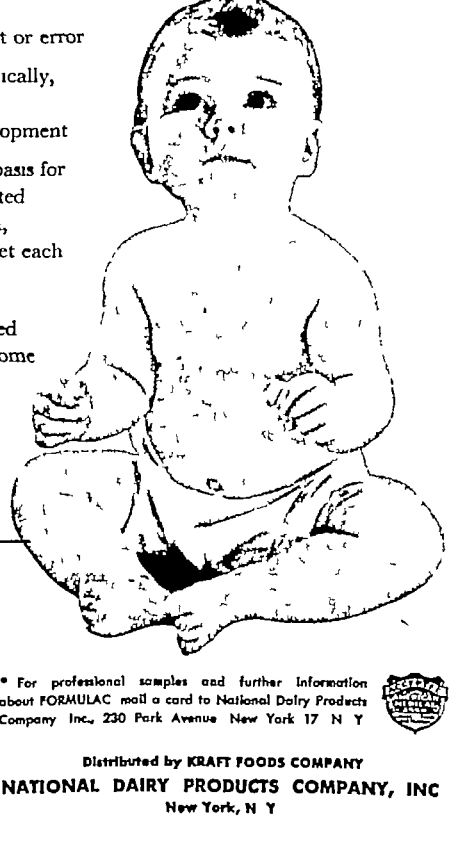
FORMULAC

the new vitamin-fortified infant food



FORMULAC was developed by E V McCollum. It is a reduced milk, in liquid form, fortified by vitamins and minerals to meet the nutritional needs of infants *without supplementary administration* Incorporation of vitamins into the milk itself eliminates the risk of human oversight or error

FORMULAC has been tested clinically, and proved satisfactory in promoting infant growth and development

FORMULAC presents a flexible basis for formula preparation Supplemented by carbohydrates at your discretion, it may readily be adjusted to meet each child's individual nutritional needs

FORMULAC is inexpensive Priced within the range of even low income groups, it is on sale at most drug and grocery stores

FORMULAC IS PROMOTED ETHICALLY

* For professional samples and further information about FORMULAC mail a card to National Dairy Products Company Inc., 230 Park Avenue New York 17 N Y

Nutritional Deficiency IN HYPOCHROMIC ANEMIA

Patients with hypochromic anemia resulting from nutritional deficiencies or blood loss exhibit one common feature With anemia once established the ensuing reduction of gastric acidity, lack of appetite, and increased fatigability tend to decrease further the food intake thus promoting or intensifying nutritional deficiencies and the progress of anemia.

Hence anemic patients will be benefited most if not merely iron is supplied (usually but one of the deficient nutrients), but also all the other factors which make for optimal iron absorption and utilization, which lessen fatigability and increase the appetite

Heptuna provides not only an adequate amount of highly available iron but, in addition notable quantities of the fat soluble vitamins A and D and the B-complex vitamins (partly derived from a vitamin rich liver extract and yeast)

J B ROERIG & COMPANY • 536 Lake Shore Drive, Chicago 11, Illinois

Each Capsule Contains:

Ferrous Sebacate U.S.P	4½ Grains
Vitamin A (Fish-Liver Oil)	5 000 U.S.P Units
Vitamin D (Tuna-Liver Oil)	500 U.S.P Units
Vitamin B_1 (Thiamine Hydrochloride)	2 mg.
Vitamin B_2 (Riboflavin)	2 mg.
Vitamin B_6 (Pyridoxine Hydrochloride)	0.1 mg.
Calcium Pantothenate	0.333 mg.
Niacinamide	10 mg.

Together with a Liver Concentrate (Vitamin fraction) derived from 6.5 Gm. fresh liver and dried yeast U.S.P Not intended for use in the treatment of pernicious anemia

vertebrate gel

Containing a uniquely acid resistant type of alumina figuratively a gel with a backbone—'GELUSIL Antacid Adsorbent is free from the constipating tendency of ordinary aluminum hydroxide preparations and escapes the ultimate fate of common unstable gels which are quantitatively converted to non-protective, soluble, astringent aluminum chloride.

Where ordinary alumina gels are destroyed by gastric hydrochloric acid, GELUSIL'* Antacid Adsorbent is uniquely acid resistant and, retaining its original protective, demulcent character, it affords unremitting symptomatic relief in peptic ulcer, safeguarding it against further erosion and irritation, and encouraging normal healing

Supplied in both liquid and tablet form, GELUSIL' Antacid Adsorbent provides acid resistant, protective aluminum hydroxide and magnesium trisilicate.

For additional pharmaceutical details consult your pharmacist—for more extensive medical data write Medical Division of William R. Warner & Co.

DUAL-PROCESSED FOR

Greater nutrient availability...

Intact food cell, characteristic of strained foods The nutriment is retained within the cellulose fiber capsule as a structural unit

After homogenization The capsule is ruptured and comminuted, the nutriment is released—subdivided—and dispersed, exposing a large surface area to the action of digestive juices

... EASIER DIGESTIBILITY
... SMOOTHER TEXTURE

In the preparation of vegetables and fruits as baby foods, home-sieving and commercial straining produce a relatively fine subdivision of the cooked food Under the microscope, foods so prepared are characterized largely by the predominance of readily identified intact food cells and by long coarse cellulose fibers

To accomplish a still finer subdivision . . . one more suitable for early supplementation of the infant's milk diet Libby places strained foods through an additional process—homogenization—and thus advantageously changes their physical structure In this manner, the finest practicable subdivision of the vegetable cell is attained, and the contained nutriment becomes homogeneously dispersed throughout the mixture

In consequence, Libby's Baby Foods present greater nutrient availability, easier digestibility, smoother texture, they afford greater utilization of food-iron*, they can be bottle-fed as part of the "formula" without perceptibly retarding the rate of flow through a nipple opening of normal size, they may be fed and are well tolerated . as early as the fifth week of life And their cellulose content, comminuted to bland ultra-small particles, maintains an unimpaired "bulk" action

CONTROL IS VITAL

When you specify Penicillin Ointment Schenley, you are assured of the highest standard of purity and excellence, because Schenley Laboratories maintains the same rigid program of control for this ointment as it has always maintained for Penicillin Schenley

Penicillin Ointment Schenley is indicated in the treatment of *superficial infections of the skin caused by* penicillin-sensitive organisms. In deep-seated pyogenic infections with penicillin-sensitive organisms, the ointment may be used as an adjunct to systemic penicillin therapy and other measures.

"by means of the chewing gum

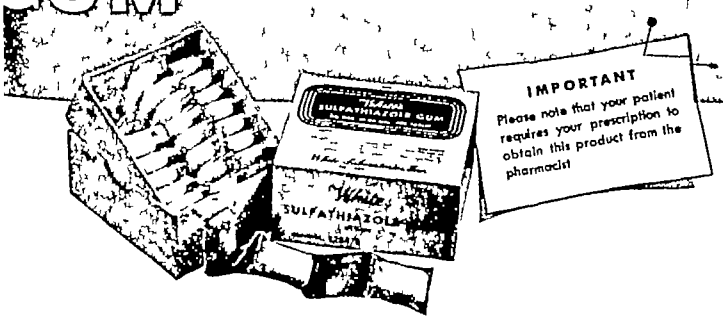
A single tablet chewed for *one-half to one hour* promptly provides a *high* concentration of locally active sulfathiazole (average 70 mg per cent) This high concentration is sustained throughout the entire chewing period, in immediate contact with infected oral mucosal surfaces Moreover, resultant blood levels of the drug, even with maximal dosage, are so low (rarely reaching 0 5 to 1 mg per cent) that systemic toxic reactions are virtually obviated

INDICATIONS Local treatment of sulfonamide-susceptible infections of oropharyngeal areas, acute tonsillitis and pharyngitis, septic sore throat, infectious gingivitis and stomatitis, including acute Vincent's disease

DOSAGE One tablet chewed for *one-half to one hour* at intervals of one to four hours depending upon the severity of the conditions If preferred, several tablets—rather than a single tablet—may be chewed *successively* during each dosage period without significantly increasing the amount of sulfathiazole systemically absorbed

Available in packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes

a product of **WHITE LABORATORIES, INC.**



ethod,

"I believe the concentration of sulfathiazole can be maintained in the mouth for some time, since the solubility of the drug is constant"

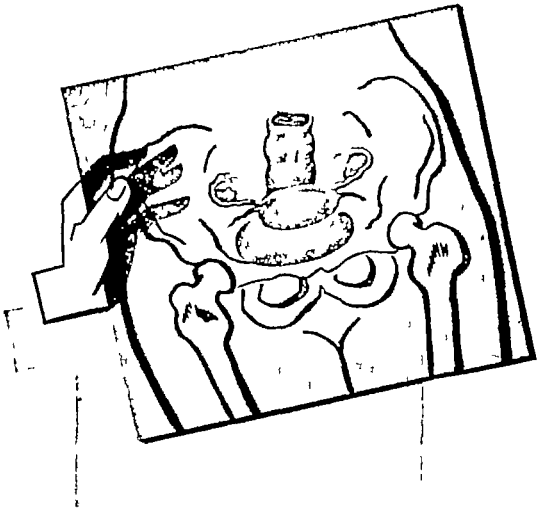
ESKADIAZINE

makes oral sulfadiazine therapy easier

ESKADIAZINE—the ideal oral sulfadiazine—has these three advantages.—



1 **Fluid Form** This new fluid sulfadiazine is the ideal oral dosage form, especially for infants and children, and also for the many adults who object to tablet medication Each 5 cc (1 teaspoonful) contains 0 5 Gm (7 7 gr) of sulfadiazine

2 **Exceptional Palatability.** Eskadiazine is so surprisingly palatable and pleasant in consistency that it is accepted willingly by all types of patients Children actually like to take it

3 **More Rapid Absorption** The findings of a recent clinical study by Flippin and associates (Am J M Sc , Aug 1945) indicate that with Eskadiazine desired serum levels may be far more rapidly attained than with sulfadiazine administered in tablet form

Smith, Kline & French Laboratories, Philadelphia, Pa.

S.K.F.'s new, outstandingly palatable fluid sulfadiazine for oral use

in painful spasm . . .

Pavatrine with Phenobarbital provides both *neurotropic* and *musculotropic* spasmolysis—notably free from undesirable side effects—combined with mild central nervous sedation. Non narcotic orally administered

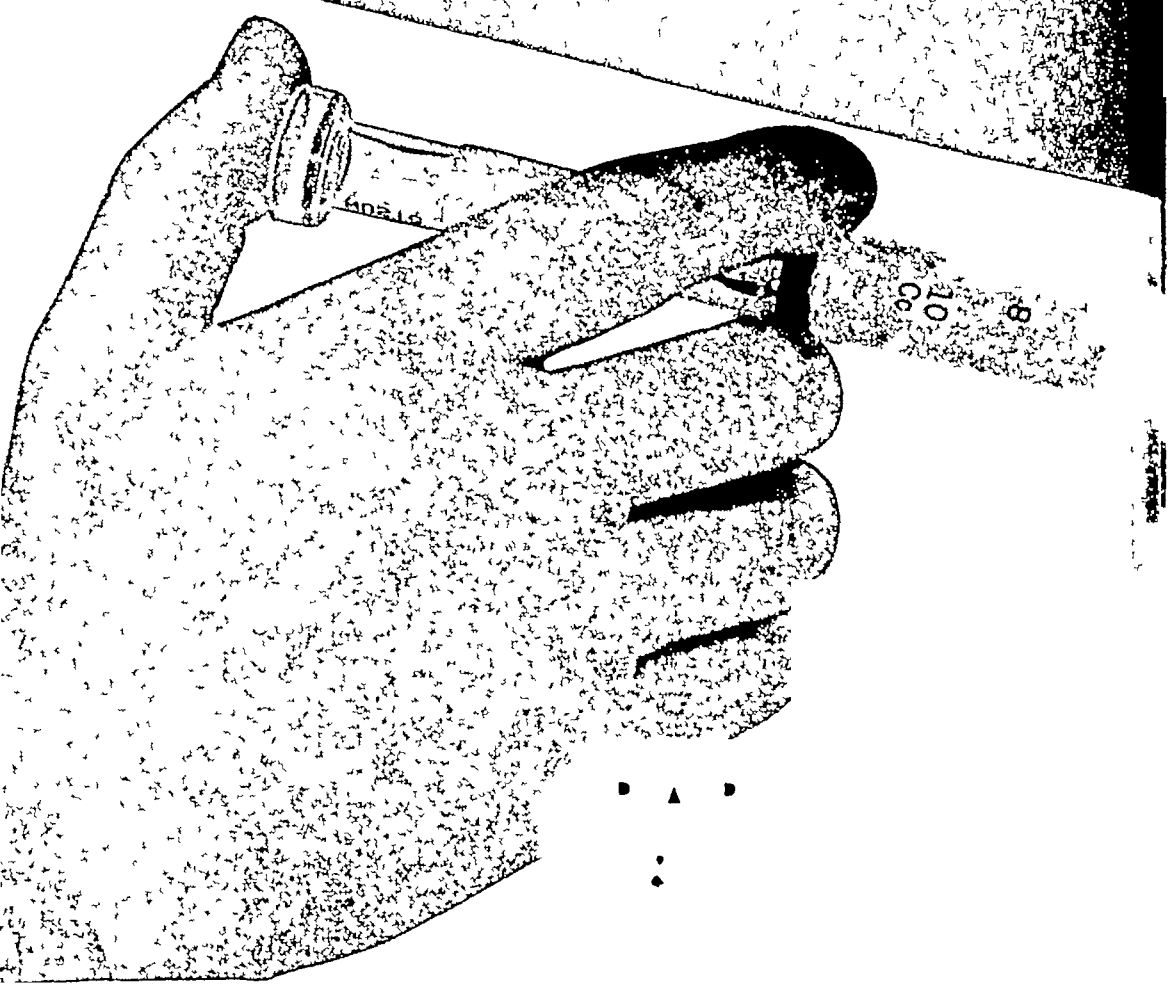
INDICATIONS

Gastrointestinal. cardiospasm, gastric hypermotility, pylorospasm, spasticity of duodenum, spastic states of colon

Dysmenorrhea resulting from myometrial hypertonicity or excessive uterine contractions

Urinary Bladder adjunctive therapy for relief of bladder spasm, whether due to a simple *tenesmus cystitis* or mechanical trauma.

Pavatrine is the registered trademark of G D Searle & Co., Chicago 80, Illinois



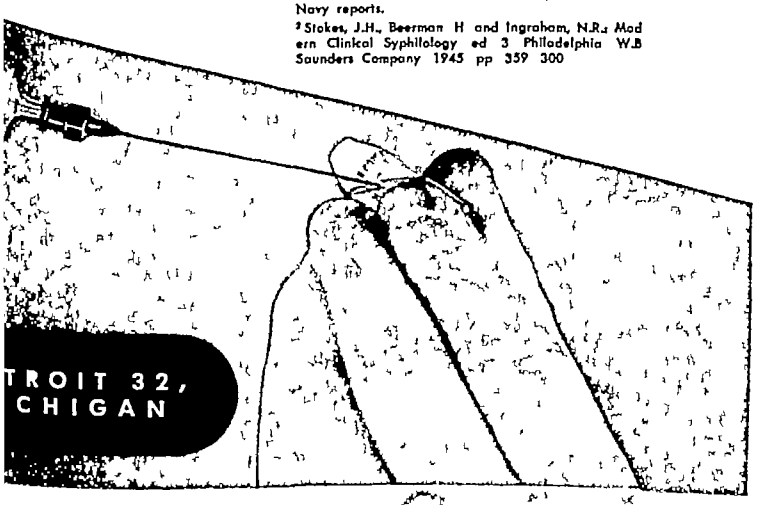
PAVATRINE WITH PHENOBARBITAL

(β-diethylaminoethyl thioxan 9 carboxylate hydrochloride)

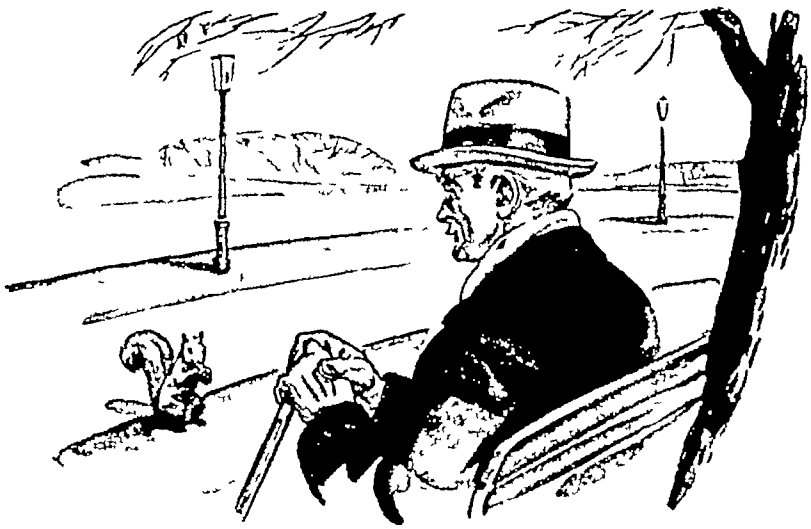
SEARLE *Research in the Service of Medicine*

The Hand of Im

MAPHARSEN now entering its thirteenth year of active clinical use, has assumed a leading role among arsenical antisyphilitics. More than 150,000,000 doses of MAPHARSEN have been used clinically during the past five years with a minimum of reaction and maximum of therapeutic effect.



ad MAPHARSEN



ted States Navy records[1] consistently show the relatively low toxicity MAPHARSEN Over the ten-year period, 1935-1944 inclusive, Navy orts indicate one fatality for every 167,826 injections of MAPHARSEN npare this to the Navy reports on neoarsphenamine for the same iod which show one fatality in every 28,463 injections

PHARSEN (meta amino-para hydroxyphenyl arsine oxide (arsenoxide) lrochloride) offers another great advantage in that its solution does become more toxic on standing, nor does agitation or exposure to increase its toxicity Stokes[2] states that no loss of efficacy or increase oxicity result when the solution is allowed to stand for several hours iosed to the air Therefore, haste need not be made in preparation he solution for injection

[1] U.S Nav M Bull 45:783 1945 and previous annual Navy reports.

ESPECIALLY ADVANTAGEOUS

for the Aged

Adequate strength can be maintained, and the manifestations of senescence can be postponed until ripe old age, if nutritional requirements are properly met But to accomplish this aim with ordinary foods alone, frequently proves difficult

As the years advance, certain foods are usually less easily digested In many instances, organic and functional affections may not only lessen the appetite, but in addition impair the powers of digestion and absorption In consequence the aged are likely to impose restricted diets upon themselves which perforce cannot meet their nutritional requirements

Ovaltine, a delicious food drink, made with milk as directed, proves especially advantageous for the aged It supplies virtually every essential nutrient in readily metabolized form biologically adequate protein, readily utilized carbohydrate, well-emulsified fat, all the essential vitamins except vitamin C, and the important minerals How readily three glassfuls of Ovaltine daily can bring the intake of essential food factors to optimal levels, is indicated by the analysis here shown

Ovaltine is digested with remarkable ease Its appealing taste is relished by the aged as well as by younger persons

THE WANDER COMPANY, 360 N MICHIGAN AVE , CHICAGO 1, ILL

Now! Symptomatic relief—and acceleration of healing—in coryza, rhinitis, sinusitis

Chloresium
REG. U.S. PAT. OFF.
Nasal Solution

provides unique advantages of

CHLOROPHYLL THERAPY

★ Chlorophyll therapy, the new basic biologic *healing* principle is now available for the treatment of acute and chronic inflammatory conditions of the upper respiratory tract through the use of Chloresium Nasal Solution

A bland, isotonic, therapeutically active chlorophyll solution Chloresium Nasal Solution provides this unique combination of advantages

1 *Accelerates healing by stimulating cell metabolism*
2 *Affords symptomatic relief without vasoconstrictor action*
3 *Promotes normal ciliary function and proper nasal physiology*
4 *Deodorizes by inhibiting the activity of anaerobic, proteolytic bacteria*

Decongests—Aids Ciliary Activity

Tested since 1941 by E N T authorities in laboratory clinic and military hospitals, Chloresium Nasal Solution induces prompt, prolonged decongestion of swollen inflamed mucous membranes with none of the objectionable after swing associated with vasoconstrictor drugs It restores the normal pH of the mucosal secretions and aids in restoring ciliary function.

Remarkable Deodorization

Chloresium Nasal Solution inhibits the activity of anaerobic, proteolytic bacteria thus providing unique deodorizing effectiveness Fetid odors, as in ozena and atrophic rhinitis are eliminated often within 24 to 48 hours

RYSTAN COMPANY
50 CHURCH ST., NEW YORK 7, N.Y.
Sole Licensee—Lakeland Foundation

Chloresium is ethically promoted
Available at all leading druggists

CHLORESIUM NASAL SOLUTION
½-oz. dropper bottles and 2-oz. and 8-oz bottles
CHLORESIUM SOLUTION (PLAIN)*
2-oz. and 8-oz. bottles
CHLORESIUM OINTMENT*
1-oz. tubes and 4-oz. jars

Chloresium N sal Sol tion c ntains the purified, therapeutically active *water-soluble* derivatives of chlorophyll " " ($C_{55}H_{72}O_5N_4Mg$) in an isotonic saline sol tion suitably f rmed for nasal instillation

*Both Chloresi m Sal tion (Plain) and Chloresium O tment contain these same *water-sol ble* chlorophyll der tives. They ar used topically to accelerate healing and deodorize wounds, burns, ulcers, nd imilar l sion especially the chronic recalcitrant, malodorous type

Postural Symptoms During Pregnancy

Often Averted Or Relieved By

A SPENCER SUPPORT

At left

A Spencer antepartum support designed especially for this woman Equally effective for postpartum period.

Abdominal support provides a rest for the weight of the abdomen and is accurately correlated with support to back, thus effecting marked posture improvement

Light, flexible, easily adjusted to increasing development

Note, also, the Spencer antepartum - postpartum breast support designed especially for her

Spencer Supports meet your patients' needs exactly *because* Each Spencer Support is individually designed, cut, and made at our New Haven Plant *after* a description of the patient's body and posture has been recorded and 15 or more measurements have been taken

For a dealer in Spencer Supports look in telephone book under Spencer corsetiere, or write direct to us

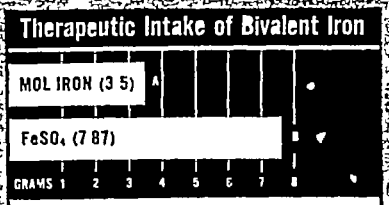
A NEW AND DEFINITE ADVANCE IN TREATING IRON-DEFICIENCY ANEMIAS



(A) Completely effective therapeutic response (return to normal blood values) was obtained in an average of 13.7 days of Mol-Iron therapy

(B) Ferrous sulfate therapy *failed* to produce normal hemoglobin values after an average of 20 3 days.

(A) The group treated with Mol-Iron averaged a daily hemoglobin increase of 2 48 per cent (0.36 Gm. per cent).

(B) The group treated with ferrous sulfate showed an average daily gain of hemoglobin of 0.83 per cent (0 12 Gm. per cent)—a response about one-third as effective.

(A) The Mol-Iron treated group received an average total of 3.528 Gms. of bivalent iron to produce the sought for result (return to normal blood values).

(B) While an average ingestion of 7 871 Gms. of bivalent iron failed to achieve an optimal response in the ferrous sulfate treated group.

The charts summarize the results of a controlled study of comparative therapeutic response in post-hemorrhagic and nutritional hypochromic anemias.

The series includes 49 cases treated with Mol-Iron and 21 with exsiccated ferrous sulfate; the results are typical of those observed in treatment of iron-deficiency anemias with White's Mol-Iron.

A specially processed, co precipitated complex of molybdenum oxide (3 mg) and ferrous sulfate (195 mg)

White's MOL-IRON TABLETS

Available clinical evidence indicates that, in hypochromic anemia, the therapeutic response to this highly effective synergistic combination—as compared with equivalent dosage of ferrous sulfate alone—has unusual advantages

1. NORMAL HEMOGLOBIN VALUES ARE RESTORED MORE RAPIDLY, INCREASES IN THE RATE OF HEMOGLOBIN FORMATION BEING AS GREAT AS 100% OR MORE IN PATIENTS STUDIED
2. IRON UTILIZATION IS SIMILARLY MORE COMPLETE.
3. GASTRO INTESTINAL TOLERANCE IS NOTABLY SATISFACTORY—even among patients who have previously shown marked gastro intestinal reactions following oral administration of other iron preparations.

INDICATED IN:

Hypochromic (iron-deficiency) anemias caused by inadequate dietary intake or impaired intestinal absorption of iron, excessive utilization of iron, as in pregnancy and lactation, chronic hemorrhage

DOSAGE: One or two tablets three times daily after meals.

Available in bottles of 100 and 1000 tablets.

Ethically promoted—not advertised to the laity

WHITE LABORATORIES, INC
Pharmaceutical Manufacturers
NEWARK 7, NEW JERSEY

Illustrated is the sulfathiazole frosted pharynx of patient A K , *two hours* after Paredrine Sulfathiazole Suspension had been instilled intranasally

WHY SUCH RAPID RELIEF

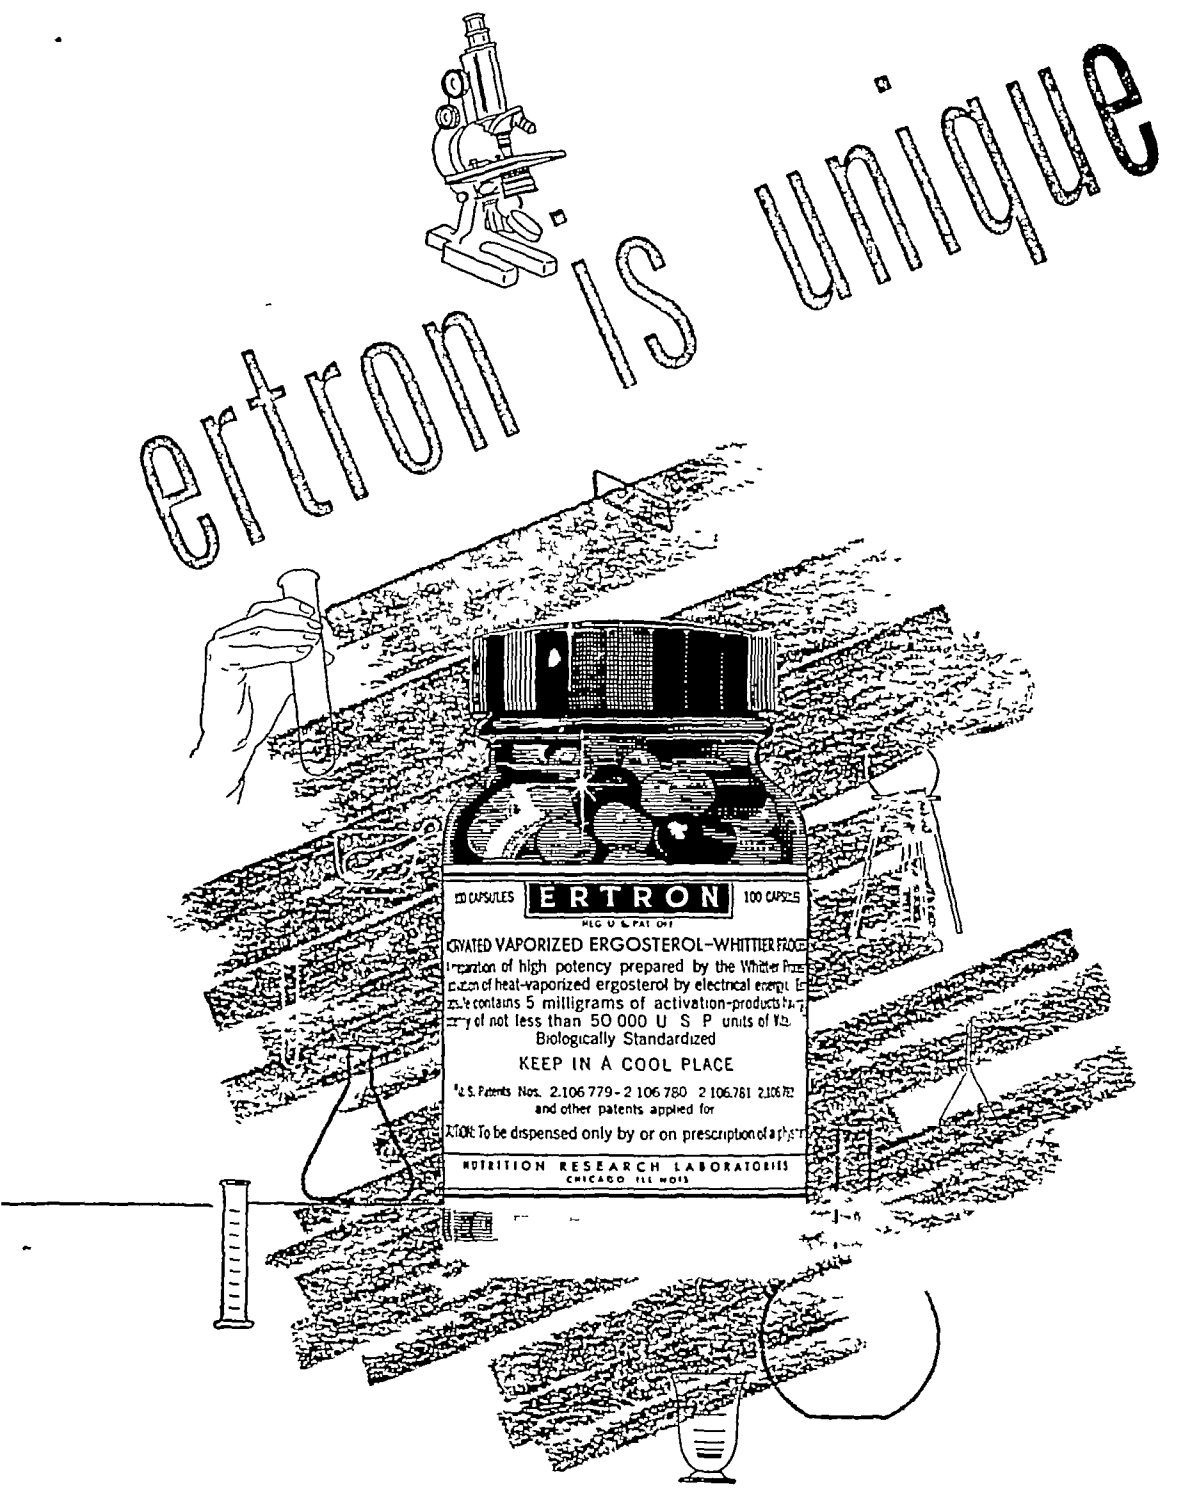
TO OBTAIN BEST RESULTS the sore throat patient should not eat or drink fluids for one or two hours after instillation of Paredrine-Sulfathiazole Suspension He should also make every effort to reduce nose blowing and throat clearing to a minimum

Smith Kline & French Laboratories, Philadelphia, Pa

IN SORE THROAT ?

There are two important reasons why Paredrine-Sulfathiazole Suspension—when administered intranasally—is so successful in the treatment of acute nasopharyngitis

1 Part of the Suspension remains beneath the middle and superior turbinates—and mixing with sinus drip retards the proliferation of bacteria before they reach the nasopharynx and intensify the infection



2 Part of the Suspension drifts downward over the nasopharynx, forming a fine frosting on the nasopharyngeal mucosa. This thin blanket not only keeps producing a bacteriostatic solution at the site of infection but also appears to provide marked surface analgesia

PAREDRINE-SULFATHIAZOLE SUSPENSION

vasoconstriction in minutes

bacteriostasis for hours

ertron IS unique

therapeutic action

☆ Therapeutically, Ertron is unique in its antiarthritic activity Many patients in large series of clinical studies have experienced restoration of movement in affected joints, relief of pain and measurable evidence of reduced swelling.

chemical composition

☆ It can now be said that chemically, too, Ertron is unique *Ertron differs in chemical composition from* the ordinary vitamin D preparations—a fact that undoubtedly accounts for the excellent results obtained with Ertron

Simply stated, Ertron is electrically activated vaporized ergosterol prepared by the Whittier Process

Ertron contains a number of hitherto unrecognized factors which are members of the steroid group The isolation and identification of these substances in pure chemical form further establishes the chemical as well as the therapeutic uniqueness of Ertron

Each capsule of Ertron contains 5 mg. of activation products having a potency of not less than 50,000 U S P Units of vitamin D

ertronization therapy

☆ To Ertronize the arthritic patient, employ Ertron in adequate daily dosage over a sufficiently long period to produce beneficial results The usual procedure is to start with 2 or 3 capsules daily, increasing the dosage by 1 capsule a day every three days until 6 capsules a day are given Maintain medication until maximum improvement occurs A glass of milk, three times daily following medication, is advised

Ertron is the registered trade-mark of Nutrition Research Laboratories

Supplied in bottles of 50, 100 and 500 Capsules

the Salicylate with

PROTECTION

against hemorrhage

Rheumatic fever frequently associates a bleeding tendency and chronically depressed levels of ascorbic acid. Salicylate treatment of rheumatic fever has proved to be of great value. But salicylate medications originally designed as headache tablets have been found to promote the bleeding tendency already characteristic of the disease process and to accelerate excretion of ascorbic acid.

Menacyl Tablets answer new therapeutic requirements arising from the realization that adequate blood levels of salicylate may prevent "the rheumatic heart." Menacyl, a critical drug for a critical indication, not only obtains prompt therapeutic blood levels of salicylate but also protects the prothrombin level and ascorbic acid functions in the patient.

Each Menacyl Tablet provides 0.33 Gm. of aspirin, 0.33 mg. of menadione, 33.3 mg. of ascorbic acid. This pharmaceutical configuration aids in maintaining physiologic balance — even during the most intense salicylate therapy. The prothrombin and ascorbic acid deficiency otherwise induced by salicylate therapy call for the counter measures provided by Menacyl. Menacyl Tablets *prevent* rather than remedy the bleeding tendency seen during intense therapy with ordinary salicylates. Available through your prescription pharmacy.

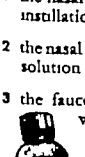
IN the treatment of paranasal infection ARGYROL offers more than effective antisepsis decongestion without vasoconstriction, and cleansing effect. It also provides for stimulation *synergetically* of the membrane's inherent, natural defense mechanism

Treatment with ARGYROL is wisely directed to these three foci of paranasal infection

1 the nasal meatus — by 20 per cent ARGYROL instillations through the naso-lacrimal duct

2 the nasal cavities — with 10 per cent ARGYROL solution in drops or by nasal tamponage.

3 the fauces and pharynx — by swabbing with 20 per cent ARGYROL solution



How Argyrol Acts on the Membrane

DECONGESTIVE—ARGYROL's decongestive effect on the membrane is the result of its demulcent, osmotic action. The withdrawal of ARGYROL tampons from the post nasal cavities frequently brings forth a long ropy mucous discharge measuring as much as two feet or more.

BACTERIOSTATIC—Although proved to be definitely bacteriostatic, ARGYROL is non toxic to tissue In nearly half a century of wide medical use of ARGYROL, no case of toxicity irritation, injury to cilia or pulmonary complication in human beings has ever been reported.

STIMULATING—Soothing to nerve ends in the membrane and stimulating to glands ARGYROL's action is more than surface action. For it acts *synergetically* with the membrane's own tissue defense mechanism.

When you order or prescribe ARGYROL, make sure you specify Original Package ARGYROL.

ARGYROL *THE PHYSIOLOGIC ANTISEPTIC WITH SYNERGETIC ACTION*

Made only by the A C BARNES COMPANY NEW BRUNSWICK N J

concrete thoughts on concretions

There is impressive evidence that urinary concretions and renal blockage incidental to sulfonamide therapy may be avoided by

1 Alkalization of the urine to provide as much as a *tenfold* increase in solubility of excreted sulfonamides in order to prevent crystalluria, and consequent hematuria or anuria.

2. Maintenance of high urinary output through increased fluid intake

Systemic alkalization as well as increased fluid intake may be accomplished simply and directly with ALKA ZANE Alkaline Effervescent Compound. A refreshing drink when administered in water, 'ALKA-ZANE Alkaline Effervescent Compound assures both adequate diuresis *and* alkalization, thus eliminating the need to force fluids"

For additional pharmaceutical details consult your pharmacist — for more extensive medical data write Medical Division.

William R. WARNER and Co. Inc. 113 WEST 18TH STREET, NEW YORK 11, N Y

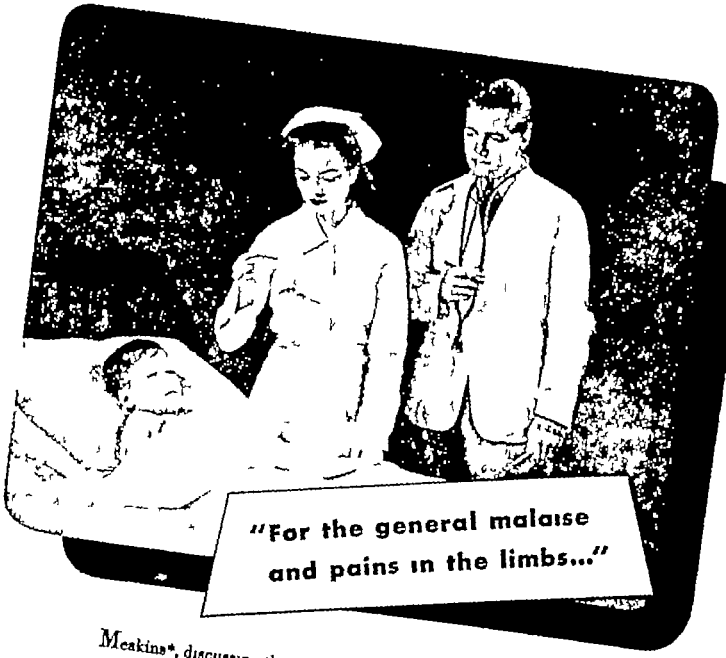
'alka-zane'

alkaline effervescent compound

supplies the important bases of the alkaline reserve—sodium calcium and magnesium as readily assimilable carbonates, citrates and phosphates. Available in bottles of 1½, 4 and 8 ounces (granules)

BELBARB

AN *Excellent* SEDATIVE *and* HYPNOTIC



The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch f exp P & P CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions In contrast to galenical preparations of belladonna, such as the tincture, Belbarb *has always the same proportion of the alkaloids*

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc

Formula Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna

Belbarb No. 2 has the same alkaloidal content but ½ grain phenobarbital per tablet

CHARLES C. HASKELL & CO., INC., RICHMOND, VIRGINIA

Meakins*, discussing the treatment of acute rhinitis suggests the use of aspirin several times daily as a means of affording symptomatic relief

An improved method of prescribing acetylsalicylate and assuring a concomitant intake of fluid is provided in—

Acetyl-Vess

—producing an effervescent salt of aspirin (8.5 grs.) buffered with sodium citrate (27 grs.)

CLINICAL ADVANTAGES: The buffer-alkali mechanism together with the CO_2 factor of the effervescent base combines to

Speed stomach emptying time—reducing tendency to gastric upset

Make preparation readily available for absorption—enhancing (augmenting) analgesic effect

Available through your prescription pharmacy in bottles of 25 tablets

Editorial

Civilian Nursing Problems

Much has been done, and done admirably, by the A N.A and the New York State Nursing Council for War Service in providing nurses for the armed forces and in thinking ahead for the future Certainly the efficiency of medical service in the State has been made possible to a great extent by the excellence of its nursing personnel We are desirous of assisting in any way possible the various agencies now endeavoring to develop better and more plentiful nursing service

"Nearly one-fourth of the nation's hospitals have been forced to take much needed beds 'off duty' because of the present acute nursing shortage. New York State has been affected as seriously as any other state in this respect. Today, right now, there are sick people being turned away from our hospitals because there is not adequate nursing personnel to take care of them

"The seriousness of this situation is brought to our attention more emphatically when we realize that it will be some time before the shortage can be overcome

"Demobilization of nurses from the Army and Navy Nurse Corps cannot correct this situation It is true that the total number of nurses needed by nonmilitary hospitals and health services today approximates that number of nurses in the Army and Navy Nurse Corps But all military nurses cannot be released now and returned to civilian nursing immediately The sick and wounded servicemen must continue to get nursing care and many of our military nurses are being retained in the services to give that care

"Even when nurses are released in any number, they will often require a period of rest and readjustment. In the meantime large numbers of married nurses are leaving civilian positions because their husbands are returning from service Volunteers and Nurses Aides are dropping off But the need for nursing service grows in civilian hospitals, in veterans' hospitals, and at home, our nurses are going to be needed to meet the aftermath of war as long as this generation lives

"The problem of adequate nursing care is not a new one for the New York State and local Nursing Councils for War Service This month marks the third anniversary of the State Council Since its inauguration three years ago to coordinate nursing service in the state, it has demonstrated effectively the need and dependability for military or essential civilian service to achieve the best possible distribution of nursing service, helped to procure eligible nurses for the Army and Navy Nurse Corps, and encouraged the training and use of auxiliary nursing personnel

"No one can look into the future without realizing that many of the accomplishments so successfully executed during wartime should be

continued in peacetime It is obvious that the future holds a need for more and more nurses and perhaps more nurses with specialized preparation

"With this thought in mind, the Council is now planning to meet the immediate and future needs for nurses and for community nursing services It is doing this by helping to staff civilian hospitals and agencies, publicizing the vacancies in hospitals, supplying nurses for emergency or special services, recruiting students for schools of nursing, maintaining a roster of nurse power and assembling information on nursing needs and resources

"If we are to have adequate nursing care in our State, in our community, it is important to realize the need for continuing the work of the New York State Nursing Council Knowing its accomplishments in time of war and its plans for peacetime, we are proud to endorse and to support this organization on its third anniversary "[1]

No one is better able to appreciate the fine work of the Council than the doctor It must be continued

[1] Release of New York State Nursing Council for War Service, November 9, 1945

Home Accidents

Apparently ordinary common sense and well-known safety precautions are not observed in many of the homes of the nation [1] As a result, the lives of many thousands of our citizens are needlessly sacrificed In a study of some seven hundred and twenty-nine home accidents made by the Industrial Department of the Metropolitan Life Insurance Company, falls and burns seem to be most frequent, followed by conflagration, gas poisoning, firearms, poisoning by other agents than gas, and injury by electric current Says the *Bulletin*

"It is a curious fact that a considerable majority of those who suffered fatal injuries in and about the home were not engaged, at the time the injury was sustained, in tasks necessary for the maintenance and operation of the household This was the case in about two thirds of the fatalities among women and in four fifths of the fatalities among men In many of these instances the person was merely walking from one room to another, or up or down stairs, relaxing on a chair or couch, or sleeping

"A surprisingly large proportion of the total number of fatal injuries in this experience occurred between 10 00 P M and 6 00 A M, when activity is at a minimum in most homes Injuries suffered during these hours accounted for about two fifths of all the deaths among women Conflagration and asphyxiation by gas contributed materially to this night-time toll Analysis of the death records reveals that conflagrations were often caused by defective or improperly used oil or coal stoves Gas poisoning arose from a variety of circumstances the inadvertent turning on of gas jets, leaking gas fixtures and appliances, and the use of gas heaters in poorly ventilated rooms

"But much more important numerically than either conflagration or gas poisoning as a cause of fatal home accidents at night are falls In fact, falls accounted for around 40 per cent of the fatal injuries suffered at night among both men and women The large number of persons reported as falling on the floor or stairs while on the way to the bathroom at night indicates the need for night lights or lights easily reached from the bed, especially in homes where there are aged or sick persons

"A considerable number of deaths also were caused by falls on entrance steps or hallway stairs by members of the household returning home late at night As the table shows, in this experience as a whole, including both night and day, falls are by far the outstanding cause of accidental death in and about the home Contributing to this large toll are fatal falls on steps, many of which are too steep or too narrow, have insufficient headroom, or are without handrails or adequate illumination

"That the smoking of cigarettes or pipes can be dangerous is evidenced by the considerable toll of life taken each year by accidents from this cause. One third of all the deaths from burns and conflagrations in the home among men were the result of careless smoking, even among women the proportion was as high as one sixth In many instances the victim dozed off in bed or in an upholstered chair with a lighted cigarette in the hand or mouth

"Another fairly common but dangerous practice is dozing off while liquids are being heated on gas stoves Last year, eleven people in this insurance experience—ten men and one women—died from gas poisoning because, while they were taking a nap, the liquid on the gas stove boiled over and extinguished the flame

[1] Statistical Bulletin, Metropolitan Life Insurance Co, October, 1945, p 4.

"Striking examples of preventable deaths are those due to firearms Playing with, lifting, cleaning, or scuffling for guns are the causes of accidents of this kind Even eating has its hazards In this experience, eight persons died last year from accidentally swallowing bones or fruit pits, with resulting choking or damage to the alimentary canal

"Altogether, the American people each year pay a high price in lives for home accidents which are preventable"

Certainly it would appear that many of these home accidents could be avoided As the report stresses, many of the fatalities were "off-duty" accidents occurring at times and in places where caution was relaxed If the facts were given wide publicity possibly something could be done about it It is noted that fatalities from smoking, in either bed, chair, or elsewhere are numerous Many ash trays, for instance, could be better designed It is a common experience to see a smouldering cigarette fall to the table or the floor from the thin edge of a badly designed or a makeshift receptacle As to smoking in bed or elsewhere, men were more frequently fatally burned than women, in the proportion of 25 to 18

Why should men more frequently die than women from dozing off while heating liquids on gas stoves, allowing the fluids to boil over, putting out the gas flame? The *Bulletin* says they do, 10 to 1 Those are perhaps the early risers, not yet fully awake

It is to be hoped that some means of reducing the number of these fatalities can be found by more intensive educational measures

Through Time's Fingers

"When the enterprising burglar's not aburgling
When the murderer's bloody hand's not steeped in crime
They love to hear the little brooks agurgling, yes, agurgling
And listen to the merry village chime"

Which brings us to the question of what editorial writers do in moments of leisure Do they take a walk, or sit and think, or just sit? Well—

Speaking of W S Gilbert, Deems Taylor says of the Savoy people, "They slip, laughing, through Time's fingers. He cannot destroy by making it ridiculous, a race that was never anything else"[1] Ho, hum—

And we of this day and age, especially those of us who are of the medical profession, are in a position to appreciate, perhaps more keenly than others, the appalling truth of that indictment, applicable not only to the Savoy people, but generally also It is not necessary to point out that we are privileged to attend humanity when it is at a low ebb, to comfort the statesman minus silk hat and striped pants, to gaze upon the diseased liver of the jurist sans robe, court attendants, and the panoply of the law, to discover, perhaps, the humble bunion of the majestic peace officer who has served us, dry-eyed, with a ticket in the past—ah, yes, "the policeman's lot is not a happy one," either

We labor to salvage what we can of this race afflicted in health with pomposity and in disease with a puffing neoplasm, to what end? To work seriously on atomic bombs, improved flame throwers, concentration camps, vitamin-enriched radio programs, and the new crystal-clear neoplastic Foreign Policy? Or perhaps to hustle people around faster, higher, lower, than ever before?

Speed, ever more speed Perhaps that is the answer The Savoy people "slip, laughing, through Time's fingers" But if only time could be abolished by shoving people around faster than time itself, what then? Isn't that the really *scientific* approach to the obliteration of the ridiculous human race? Already we have the supersonic plane. It should be no trick at all to improve that to the point where a pilot could shake hands with his own grandfather, or maybe with Mr W S Gilbert himself

Perhaps our late beloved Hans Zinsser had something of the sort in mind when he described the last of R. S.[2] "It was all mov-

[1] Preface to Plays and Poems of W S. Gilbert.

[2] Zinsser Hans: As I Remember Him 1940

ing too fast for him," he wrote of R S 's impending death "Indeed, he was not sure whether the world that was rushing by was going forward or backward He wondered whether he had not, perhaps, been born a little too soon and remained unable to catch up with his time The world to which he had been born had not alone speeded up with that acceleration of which Henry Adams complained, but it had actually seemed to change direction Scientific progress had brought as much sorrow as happiness With immensely enhanced powers of production, millions were out of work and starving. Ideas of democracy and individual freedom which he had accepted as the gradually evolved goals of centuries of struggle were not only being denied, but entire nations were frantically intent on destroying them Great racial masses seemed willing to fight and perish, if necessary, for their own enslavement New so-called 'ideologies' were tearing up the foundations of all that men had thought firm and permanently established Something had cracked in the old Western civilization, and its walls and lofty towers—cemented with the sweat and blood of their forefathers—were tumbling about men's ears And the intellectual calamity seemed to be that no one could say whether the turmoil was the result of avoidable stupidity or of the operation of laws of economic and social evolution that were acting on mankind as other laws had acted on the dinosaur and the sabre-toothed tiger "

Maybe something has cracked in the old Western civilization Could it be the doom of writers of editorials? If so, what difference?

Time Brings Changes

Readers of the JOURNAL in 1945 will have noted many changes These have been brought about slowly but they have been the result of action initiated sometimes years previously An instance is the front-cover "box" featuring the more important articles and editorials for ready reference

Then the contents have been departmentalized, and it is contemplated to amplify the clinical-pathologic conferences as soon as arrangements can be completed with the sources of this valuable material

Necessarily the war, difficulties with paper, and delays in printing-plant schedules have interfered with normal production, and have retarded the further improvements in the JOURNAL contents which the editors and the Publication Committee have had in mind for years, but have been unable to bring about as rapidly as could be wished Restrictions on travel and the holding of meetings has severely cut the normal inflow of scientific articles which ordinarily have been derived from the Annual and District Branch meetings These difficulties have taxed greatly the resourcefulness of the Managing Editor and the associate editors in coping with this situation To the fact that the Society now publishes its own journal with competent business and advertising management may be ascribed its healthy independent growth and development Luckily, we have had to contend with few strikes, up to the time of writing, which have interfered with production Many other publications have not been so fortunate, possibly through no fault of their own

The JOURNAL has been late, it is true, but it has eventually appeared The good nature of our members, our subscribers, our printers, and advertisers under these circumstances has been a constant source of gratification to the JOURNAL management Apparently we have a host of friends whose patience is only exceeded by their good manners We want them to know that we are appreciative, and that we shall not abuse the courtesy which they have extended to us in a difficult period On our part every effort will be made, as rapidly as circumstances permit, to raise the standards of the JOURNAL, to bring it out on schedule, and to increase the amount of scientific material published

Current Editorial Comment

Trouble Poor old medicine is in trouble again Time was when Moliere,[1] a competent French playwright, kicked it around in the high old times of Louis XIV Now, Bernard Shaw seems to be supplementing his vegetarian diet, his income, and his waning abilities as a thinker by a little shavian showmanship at the expense of Mr Douglas Guthrie, fellow of the Royal College of Surgeons, who has just written an English history of medicine The *New Yorl Journal American* has been publishing Mr Shaw's articles, commencing October 30, 1945, if any one is interested

We mention the fact more for the record than for any other reason, except possibly to call it to the attention of Mr Bernarr Macfadden, who might care to use some of the material in his Sunday lectures on Cosmotarianism, a Religion of Happiness Our perusal of Mr Shaw's first article in the *Journal American* convinces us that these articles will be right up Mr Macfadden's alley Nobody else that we know of would pay much attention to the first one, except perhaps Phineas T Barnum, and unfortunately he is no longer with us—though Mr Shaw's first article seems to prove the correctness of one of his remarks on the birth rate

Free X-Rays From the S C A A *News* for October, 1945, we learn of free chest x rays for all of Broome County adults

"Step right up, folks, and get your free chest x-ray!"

"It is as simple as that in Broome County following the dedication August 24, of a new $18,000 Mobile Chest X-Ray Unit, purchased by the Broome County Tuberculosis and Public Health Association with the financial assistance of numerous local industries in the Binghamton, Endicott, and Johnson City (Triple Cities) area.

"With a band playing and a fanfare of publicity the dedication ceremonies took place in the Assembly Hall of the I.B.M (International Business Machines Corporation) Country Club With Robert H. Austin, President of the Association, presiding, the dedication address was made by Thomas J Watson, President of I.B M Speaking also were Mrs. Charles F Johnson, Jr., prominent civic leader of the Triple Cities, and Dr Robert E. Plunkett, Superintendent of Tuberculosis Hospitals, State Department of Health

"Dedicating the unit to the future health and well being of the citizens of the county, Mr Watson said, 'I feel that all of the industries taking part in providing this unit believe that we are not contributing solely to the community but we are benefiting ourselves because we know from experience how much we have profited through the x-ray examinations our employees already have received Not only have we detected tuberculosis but we have found that while we were x-raying our people for signs of tuberculosis many other diseases were uncovered that our employees did not know they had'"

"'When compared with some other diseases, the purchase price of tuberculosis control may be considered a bargain,' stated Dr Plunkett in his address 'This is so because we know its cause, we know how it is spread as a communicable disease, we know how to prevent it, and we know how to treat it. Moreover, it costs only pennies to control it but dollars to tolerate it.

"'The purchase and intelligent use of this new mobile x ray unit are certain to pay encouraging dividends in health It is essential as the first tuberculosis-control step—early diagnosis Benefits of this splendid service will expand far beyond local boundaries Broome County, through its Tuberculosis and Health Association and its industrial leaders, has contributed signally toward the expansion and extension of tuberculosis control by means of their active interest in protecting the health of employees and their families'"

Eighteen industries of the area contributed to the purchase of the mobile unit It would be well if Dr Plunkett's observation on tuberculosis, "*it costs only pennies to control it, but dollars to tolerate it,*" were taken to heart by industrial management and the public It is well symbolized by the Christmas-seal campaign

Release of Medical Officers. "*Demand swells* from medical organizations, press, business, labor, Congress, from the doctors themselves in uniform, and above all from thousands who anxiously await the return of their own family doctor, *for the release* of the greatest number possible of the *doctors in service*

"Very definite *official* word should be forthcoming soon from Army and Navy

[1] Jean Baptiste Poquelin 1622-1673.

authorities as to *how many, how soon,* and on *what basis* doctors are to be released Newspapers report that *13,000* to *18,000* doctors now in the Army are to be out by the end of the year, and *30,000* by July 1, 1946 "

So says the *News Letter* of September 20, 1945, of the Council on Medical Service and Public Relations of the A M A We hope that the Council's report of the newspapers' report will not prove to be overly optimistic We receive daily rather disheartening correspondence from the Pacific, from Germany, and from domestic sources which tends to make us keep our fingers crossed and view with skepticism nearly all statistical data on the release of medical officers With us, seeing is believing

• • •

Residences and Fellowships. "Elsewhere in this issue (*J A M A*) is a newly revised list of Approved Residences and Fellowships for Veterans and Civilian Physicians Included in this group are seven hundred and thirty-six hospitals whose educational programs have been investigated and approved by the Council on Medical Education and Hospitals Education in these institutions is acceptable to the American boards The hospitals are also eligible for the training of veterans under the G I Bill of Rights The current list offers seven thousand, six hundred and sixty-six residencies and assistant residencies as compared with five thousand, seven hundred and ninety-six in 1943 However, in relation to the normal peacetime number of five thousand, two hundred and fifty-six residents reported in 1941 there is a total of two thousand, four hundred and ten additional openings to meet the immediate needs of returning veterans As the peak of medical demobilization is reached, hundreds of additional residencies will no doubt be available Many of the approved intern and residency hospitals which have not yet attained a full development of educational services are now organizing new training programs or creating a further expansion of residencies already in existence Hospitals in every part of the country have indicated a desire to participate in the postwar educational program as far as their facilities and teaching material will permit In many institutions these plans are already well advanced, so that a considerable number of residences now in process of investigation may soon be added to the approved list The Council, in collaboration with the Committee on Postwar Medical Service and the American Boards, will continue to exert every effort to provide additional educational opportunities of high quality for physicians seeking advanced hospital training on their return from military service "[1]

•

Office Space To relieve the present shortage of available office space, practicing physicians are urged to share their offices with doctors who are returning from service

An editorial appearing in the September 29 issue of the *Journal of the American Medical Association* said

"In large communities, such as cities of over 100,000 population, the problem is apparently far more serious than in the smaller areas In some larger cities physicians are even remodeling old houses into office space Many a physician whose office is not fully utilized either in the morning or in the afternoon or even in the evening can make available time and space, as well as the use of his own facilities The least that can be done for such veterans is to make available to them an opportunity to begin the earning of a livelihood at the earliest possible moment "[1]

OBSERVATIONS MADE DURING A POLIOMYELITIS EPIDEMIC IN 1944 IN THE HORNELL STATE HEALTH DISTRICT, NEW YORK

JOHN A CONWAY, M D , and D E BIGWOOD, JR , M D , Hornell, New York

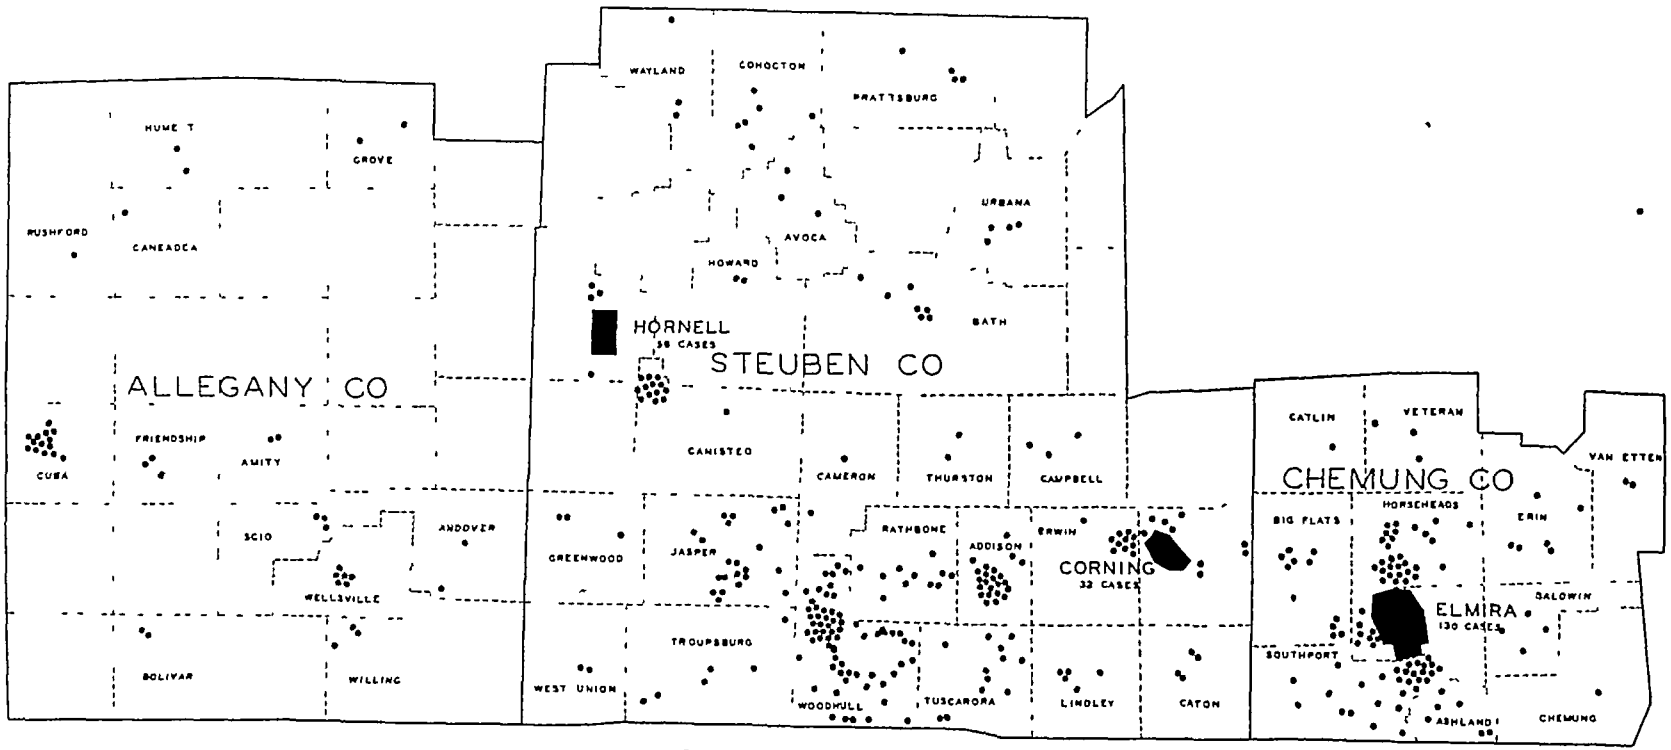
THIS report concerns a description of the poliomyelitis epidemic which occurred in 1944 in the three counties comprising the Hornell District of the New York State Department of Health These observations were made by various members of the district staff under the direction and supervision of the senior author Some of the data are by-products of activities incident to the epidemic, other information was obtained from routine reports submitted to the district office, and a third category of facts was collected specially, through visits to patients and their homes

Scope of the Epidemic

It was apparent early in the summer of 1944 that a poliomyelitis epidemic of sizable proportions was under way, and though we were aware at the start that numerous field studies had already been published, it was thought desirable to obtain as clear a picture of the outbreak as possible within the limits of the time and the personnel available From a personal point of view, such a study was considered profitable, and locally it will have a historic value if no other

For the epidemic is unique in the area involved, and of unusual severity in any comparison About 600 cases—591, to be exact—occurred in the three counties of Allegany, Steuben and Chemung, among a population of about 200 000, according to the 1940 census The over-all rate has been calculated to be 288 6 per 100 000 a striking contrast with the previous low incidence of poliomyelitis in the district No one recollects any large number of cases there prior to 1916, and since then the average annual rate of reported poliomyelitis has been 7.5 per 100,000 Even in 1916, the year of New York's first major statewide epidemic, there were only 61 cases in the Hornell District as now constituted During the twenty-seven years since, the annual total of reported cases has exceeded 20 only eight times, the largest number being 30 in 1930

Clinical Observations



Although our major interest in this outbreak concerned its epidemiology, the opportunity presented for clinical observations could not be ignored Much of the material under this heading collected during consultations visits to hospital wards, and calls at the homes of patients, is discursive and does not lend itself to concentration For example, a number of interesting diagnostic problems were encountered and several case histories with unusual signs and symptoms could be recorded if space would allow The size of the epidemic also ensured a good representation of the usual types of cases—bulbar, meningitic, and polyneuritic—as well as a large number of "abortive" or nonparalytic cases In fact, the extent of the epidemic is appreciably greater than would have been reported a few years ago, due to the inclusion of many patients who were paralyzed slightly or not at all

The criteria for a diagnosis of poliomyelitis differed in minor details for each reporting physician and changed as the epidemic became manifest In general, a fever plus resistance by the patient to flexion of the neck and back were two essential findings If these were combined with an elevated spinal-fluid cell count, muscle spasm (e.g , "tight hamstrings"), or gastrointestinal symptoms, the diagnosis was usually made Headache and vomiting were two other frequent symptoms Muscular weakness together with fever and stiff neck was the syndrome universally accepted as diagnostic

Throughout the epidemic there was a tendency to rely heavily on abnormalities of the spinal fluid, particularly an elevated cell count, in making a diagnosis The prognosis too was apt to become more reserved, the higher the count. The usefulness of an objective laboratory test in clarifying and confirming a diagnosis of poliomyelitis was generally appreciated and the large majority of reported cases had such tests. But it was also clear that the spinal fluid examination had to be integrated with the clinical picture This is demonstrated to be true by tabulations of more than 350 spinal fluid examinations recorded in the district office during the epidemic. Somewhat more than one examination in eight on reported cases of poliomyelitis showed a normal spinal fluid cell count and only a few (9 of 48) of these patients were nonparalytic On the other hand, 2 of the 5 patients with cell counts over 500 had no paralysis at any time and, broadly speaking, no clear correlation could be established between the extent of paralysis and the height of the count.

When considered in relation to the duration of the disease, the lower cell counts were found to occur early as a general rule, but even on this point the analysis shows at best a tendency which is not followed by a considerable minority of cases

HORNELL STATE HEALTH DISTRICT WITH POLIOMYELITIS CASES REPORTED 1944

POLIOMYELITIS
CASE RATES PER 100000 BY TOWNS
HORNELL DISTRICT - 1944

0 | 50 100 | 100 200 | 200 300 | 300 500 | 500 - 1000 | 1000 & over

With the exception of a few who were given penicillin and sulfonamides in varying doses without effect, and excepting also the patients treated with gamma globulin,[1] also unsuccessfully, treatment during the acute stage was not directed toward an immediate cure No convalescent or adult blood or serum was used, since the consensus of the local medical group was that such agents had no therapeutic value Rather, treatment was built around a program of support and symptomatic relief Hot packs in particular were used extensively both in the hospital and at home and were efficient in relieving pain and spasm of affected muscles The very warm weather during the epidemic, compounded in effect by the use of hot packs, made the danger of heat exhaustion among the patients a real one In at least one hospital this danger was averted by the routine use of more or less continuous proctoclyses

Hospitalization, with all its attendant benefits, was perhaps the most effective means of treating the poliomyelitis cases, and almost three quarters of the patients were sent to such institutions during their acute sickness This is considered an excellent showing in a largely rural area with limited facilities, and certainly was instrumental in minimizing the death rate and limiting the development of deformities It is not possible to demonstrate this effect in figures, since there was a definite selection of cases for hospital care as, for example, those needing respirators

A classification of cases according to the maximum extent of paralysis during the acute phase of the disease was felt to be pertinent and interesting, but difficulties were encountered due to the lack of any accepted scale which would consider the number and size of muscles involved as well as the severity of the involvement Some such scheme of rating as Drs Bahlke and Perkins evolved in their study of the effect of gamma globulin on the disease[1] was needed Even without such a scale, however, it is possible to say that about one in five was a bulbar case and at the other extreme, about the same proportion had no involvement A rough classification of the remainder shows that 16 per cent of all the patients had minimal involvement, 27 per cent were moderately affected, and 10 per cent were severely paralyzed This type of grading is admittedly subjective and unreliable, but the basis for it is not Practically every patient had at least one muscle grading by an orthopedic nurse during the acute stage of the disease, and these examinations were verified in almost every instance by an orthopedist

A determination of whether a given patient should be called paralyzed or not presented difficulties both in the examination and in the classification Painful, spastic muscles were difficult to test for strength, and in the classification, the question was encountered of deciding when an unimpressive weakness was to be called "paralysis" The dilemma was resolved in this paper by deciding that any patient who had less than normal strength in any muscle, as determined in an orthodox muscle grading, was classified as paralyzed It is appreciated that such a definition of "paralysis" is very inclusive, but less precise ones shade vaguely and lead to errors of interpretation

It may be argued that the inclusion of so many patients with minimal involvement among the paralyzed is a distortion of the true picture, and certainly it is impossible to correlate such an analysis with many others in the literature However, a review of the progress of these patients shows that many of them with minor muscle imbalances originally now show scolioses and other preventable defects, so that administratively at least, they must be considered as needing continuing medical supervision

Prolonged hospitalization in reconstruction institutions was necessary for 90 patients, or 16 per cent of the total, and about half of those were still there during the summer of 1945 The progress which other patients have made can be determined from orthopedic clinic and nurse records From these charts, it has been determined that at least half of the patients reported now show no paralysis according to the rigid criteria already discussed And gradings of minimal, moderate, and severe involvement now include 17 per cent, 20 per cent, and 7 5 per cent, respectively, of the entire case count It is interesting also to note that 17 patients (3 per cent) still show evidence of involvement of one or another of the cranial nerves

Epidemiologic Data

Much of the preceding discussion concerns activities of practicing physicians and the district staff in behalf of individual patients, and the comments have been abstracted from routine records of these activities No such reservoir of information was available which bore on the epidemiologic features of the outbreak For this reason, visits by an epidemiologist were planned to the home of each reported patient with poliomyelitis in order to verify the data on the report cards and to obtain a variety of supplementary information about the present illness of each patient and his past history, about the home, its inmates, and its physical and animal surroundings These visits were to be made as promptly as possible after the reports were received, but the pressure of other activities prevented the full realization of this program

And, as is usually the case, when the records of the visits were reviewed, some were found to be incomplete or otherwise unacceptable This explains why many of the following tabulations are concerned with fewer cases than the 501 reported

General Course of the Epidemic.—The Hornell District is located in southcentral New York State and its topography is hilly upland It is composed of the three counties, Chemung Steuben, and Allegany The largest city in the district, Elmira, had a prewar population of 45,000 and is now estimated to have more than 50,000 Two other cities, Hornell and Corning, also are in the district and each has a population exceeding 15,000 There are about thirty villages in the three counties, varying in size from a few hundred to 5,000 people With the exception of Elmira and its vicinity, there has been no great disturbance of existing population patterns since 1940, except that due to the operation of the selective service system The total population of the district, as mentioned before, is about 200,000

The first reported case of poliomyelitis in the district in 1944 occurred in a small hamlet about three miles southwest of Addison village in Steuben County on June 9 Within the next two weeks, a number of other cases were reported along the Pennsylvania border, south of the home of the first patient, and Addison village immediately to the east, experienced a sharp outbreak of 17 cases between mid-June and mid-July Meanwhile, other cases continued to occur in the rural area south of the villages of Addison and Woodhull, with a number soon reported from the latter place Thereafter, other cases were reported east and west of this original focus and by the first week of July, Hornell—about 25 miles away to the northwest—had its first case and the following week Corning, 12 miles to the east, had its first case. As the epidemic continued in these areas, scattered cases were reported in the northern part of Steuben County and in Allegany County to the west. This outward spread from a central point was expected but the persistent occurrence of new cases in the rural area first involved was not. Woodhull town and village, where the disease appeared early, continued to have cases through November with a final total of 63 among 1,292 people, a rate of almost 5 per cent (4,876 per 100,000)

Almost simultaneously with the first case near Addison, another was reported from the area immediately south of Elmira, with quick spread of the disease to that city and its suburbs, and later, to the surrounding rural area No connection, direct or indirect, could be discovered between the cases first reported near Addison and south of Elmira, and each originated a wave of

POLIO CASES BY WEEK OF ONSET AND TYPE OF INVOLVEMENT HORNELL DISTRICT - 1944

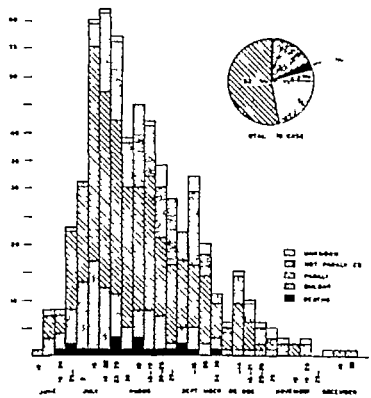

FIG 3

peripheral spread which can be fairly clearly outlined The spot map of the cases (Fig 1) shows the general distribution of the reported disease

Investigation of the first case in Steuben County indicates that the patient made many visits to Elkland, a Pennsylvania village just across the state line, where there was preexisting poliomyelitis and where he probably acquired his infection Nine cases were reported from the vicinity of Elkland during the winter and spring of 1943–1944 and during the ensuing season the disease spread throughout nearby northcentral Pennsylvania, as well as into New York State This report is therefore incomplete as an investigation of a circumscribed outbreak to the extent that it neglects more than 150 cases in Pennsylvania which followed the original ones in Elkland and were, of course, a part of the same outbreak.

During that same year, extensive outbreaks occurred in other parts of the state, particularly in Buffalo and vicinity, with 1,069 reported cases. The upstate report for 1944 was 4,180 cases, with all but two counties contributing to the total

Case Rates.—When the information of the spot map is transposed into case rates per 100,000 population, the picture of the epidemic appears as in Fig 2 In this representation, rates have been calculated according to towns, including the

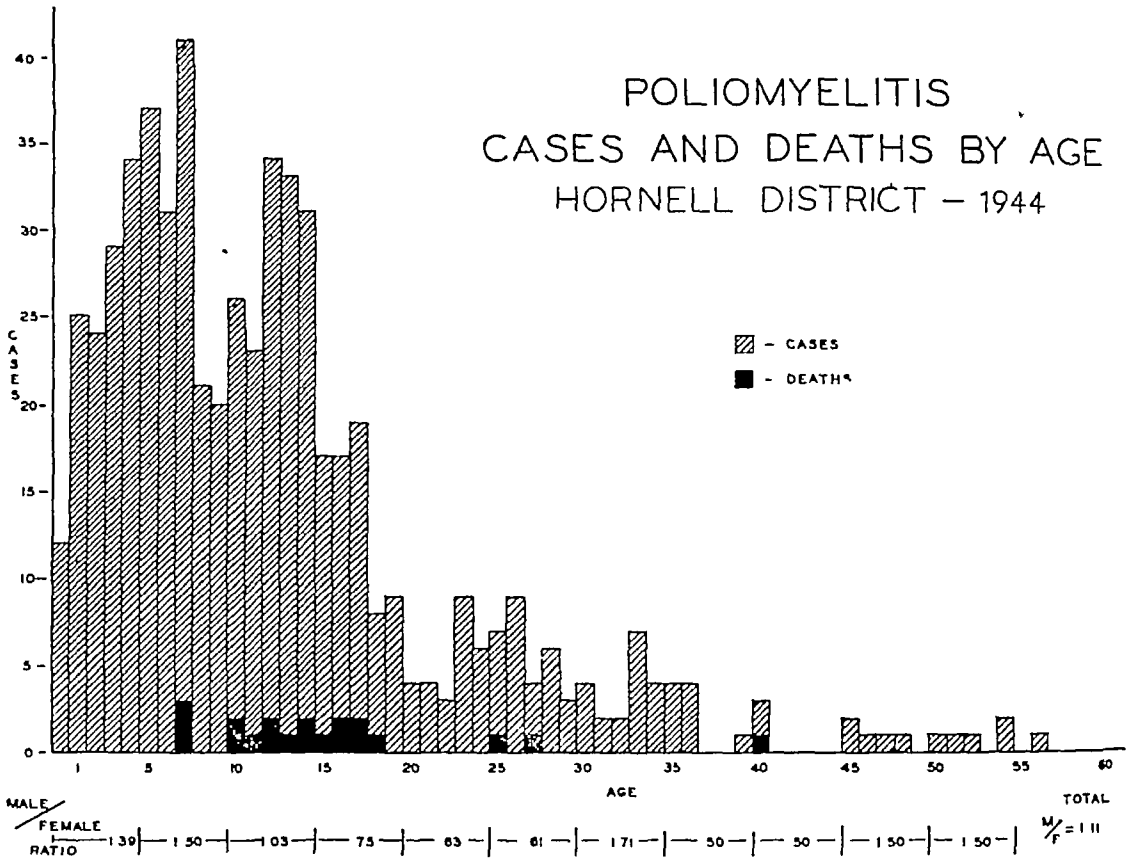

FIG 4

population of any municipalities in them The high incidence in the rural area of Steuben County first affected is immediately apparent, and the fantastic rate of almost 5 per cent in Woodhull has already been mentioned During this epidemic the higher rates occurred generally in rural areas, and in those towns (exclusive of villages) which had cases the average rate per 100,000 of reported cases was 474, compared with an average of 287 per 100,000 in the three cities of Elmira, Corning, and Hornell

Fig 2 also demonstrates a comparatively low rate in Corning (179 per 100,000), although this city had its first case in mid-July with ample time to develop a severe outbreak As can be seen, Corning lies between two areas of severe involvement, the area of high rates to the west is naturally tributary to it, and the city is linked to Elmira by the most heavily traveled road in the district On both of these counts, Corning was expected to have more cases than it did

Another interesting observation is the low incidence of the disease in most of Allegany County and the northern half of Steuben County Although the map integrates these areas in the general picture as places with gradually decreasing incidence at a distance from the original center of the outbreak, it is otherwise difficult to explain why so few cases occurred in these areas Allegany County reported its first case the second week of July, the same time as Hornell, but only twelve of twenty-nine towns had cases Northern Steuben County had its first case the following week, but eight towns in the county had none Neither area has had much previous experience with poliomyelitis and average annual rates since 1916 for these two areas are actually slightly lower than for the southern half of Steuben County which was so severely affected

Incidence in Time —Fig 3 represents the cases reported during the calendar year 1944 according to week of onset and type of involvement The dates of onset as plotted have been verified by home visits for a majority of the cases and the types of involvement obtained from orthopedic clinic charts The criteria for classifying a patient as paralyzed or not have been discussed previously

The maximal number of cases, 62, was reported during the third week of July, less than two

months after the first patient was afflicted, and thereafter, the curve of incidence fell more or less steadily in spite of at least eight weeks more of generally hot, dry weather Conversely, the regularity of the decline was not abruptly altered by frosts, which occurred during and after the last week of September

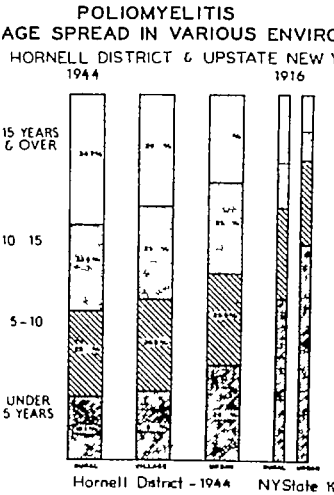
None of the various categories of cases were concentrated during any particular period of the epidemic Nonparalyzed patients were few during the first month, but as the outbreak continued this type regularly accounted for about a quarter of each week's total of new cases The lack of reported abortive cases early in the season is a common observation attributed to diagnostic difficulties in the absence of known prevalence of the disease.

The case fatality rate of 3.5 per cent is worthy of comment, both on its own account as an exceedingly low rate, and as well, as an indication of very complete reporting, a fact which may have been obscured by the classification of so many patients as paralyzed

Age and Sex Distribution.—The age and sex distribution of the 576 cases reported in 1944 are shown in Fig 4 This demonstrates the observation, which is now commonplace, that the disease is no longer an affliction of infants In the Hornell experience, 7-year-old children were most frequently attacked, and the group from 10 to 15 years old had more cases than the group under 5 years of age. There is evidence, too, that if the epidemic had occurred in the district before so many young adult males had been inducted, the number of cases in those from age 15 to 35 would have been appreciably higher For in this group, the normally expected predominance of male cases is reversed, when the calculation is based on 1940 census figures as in the chart. When the withdrawals of men for service in the armed forces are used in reckoning the actual civil population in the district in 1944 by age and sex, male cases actually exceed females by ratios from 1 09 in the 15- to 19-year age group to 2.24 in the 30 to 34 age group

The deaths, in addition to being remarkably few, have an unusual age distribution Most of the poliomyelitis mortality is expected at the extremes of life, but in the Hornell District in 1944, the adolescent patients were relatively the most apt to succumb, and no deaths at all occurred in those under 7 years of age. Patients over 25 years old died less frequently than those from 10 to 20 years of age

Age Distribution According to Environment.—Fig 5 demonstrates that age distributions of the cases differ depending on where they occur Thus, relatively more infants and children under 5 were attacked in an urban environment than in



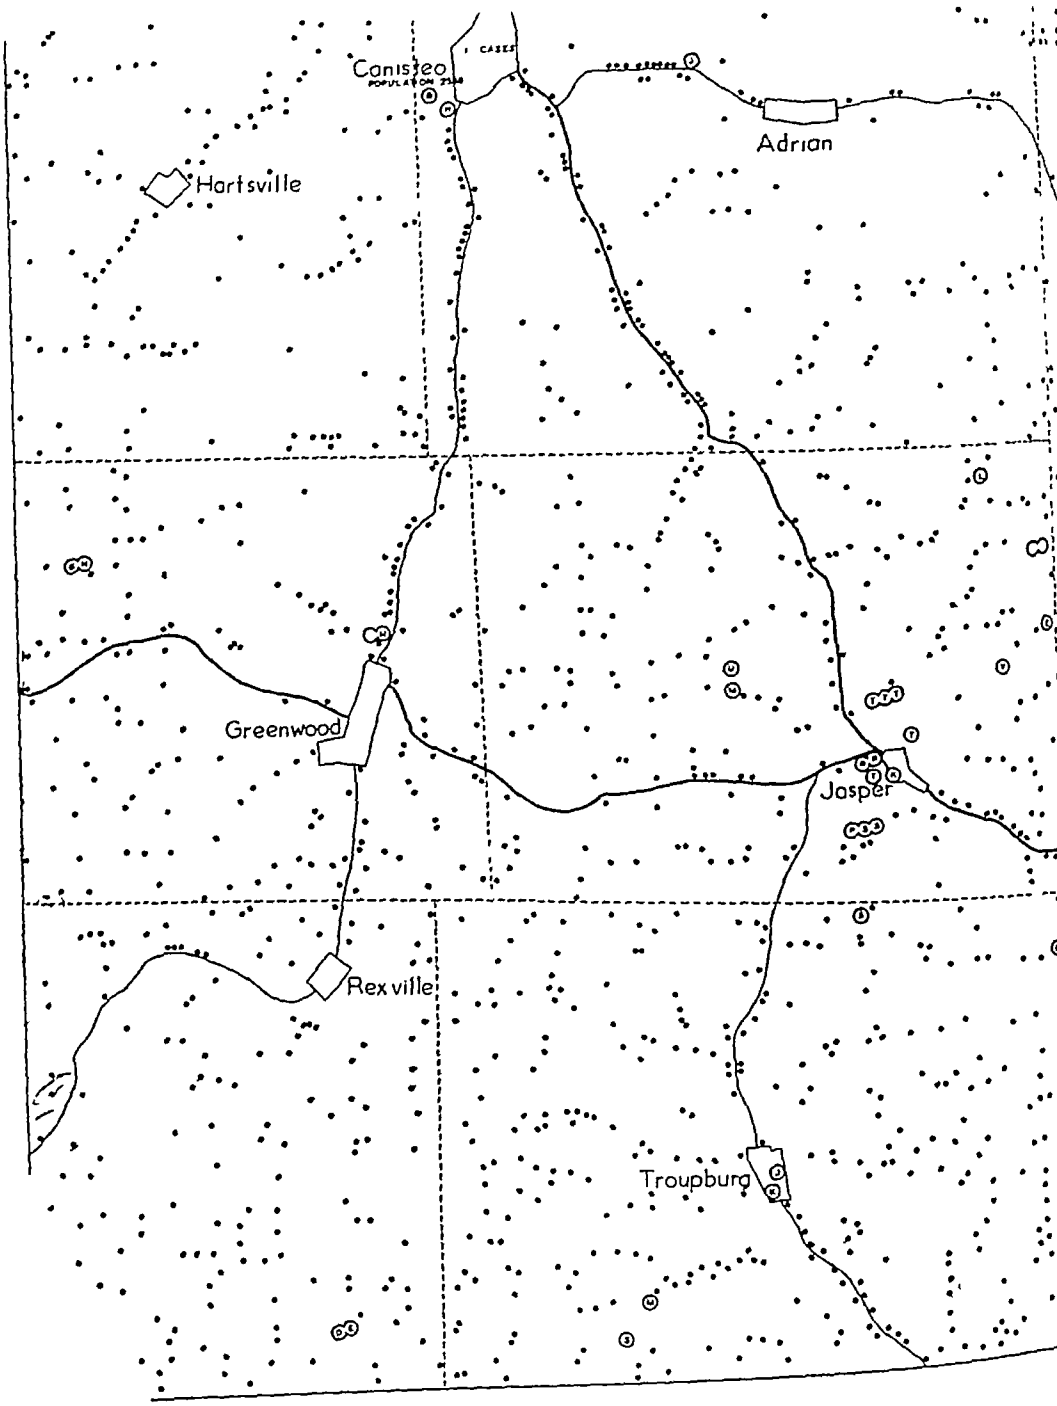


FIG 5.

rural areas, and, conversely, fewer people over 15 were found to be cases in the city than in the country If an intermediate group is chosen, composed of cases reported from villages and suburban areas, its age distribution also compromises the differences between the other two This observation has been made many times before, and is usually explained as due to greater exposure to poliomyelitis virus during the multiplicity of person-to-person contacts in urban environments and a resultant greater immunity among adult city populations

Dr M Nicoll analyzed the data for the 1916 epidemic in New York State in the same way with a demonstration of the same differences, as indicated on the chart.[2] However, the striking shift of age incidence to older groups in the 1944 epidemic in the Hornell District compared to that of the epidemic in upstate New York in 1916, a shift which has been noted in other recent epidemics, has had no very satisfying explanation

Sickness in Poliomyelitis Homes.—The diagnosis of poliomyelitis in the absence of frank signs of muscle weakness is a puzzling one and, as previously pointed out, is dependent to a degree on the circumstances surrounding the case, as well as the signs and symptoms presented Thus, a nonparalyzed patient with poliomyelitis is usually reported only when the virus is known

Troupburg

months after the first patient was afflicted, and thereafter, the curve of incidence fell more or less steadily in spite of at least eight weeks more of generally hot, dry weather Conversely, the regularity of the decline was not abruptly altered by frosts, which occurred during and after the last week of September

None of the various categories of cases were concentrated during any particular period of the epidemic Nonparalyzed patients were few during the first month, but as the outbreak continued this type regularly accounted for about a quarter of each week's total of new cases The lack of reported abortive cases early in the season is a common observation attributed to diagnostic difficulties in the absence of known prevalence of the disease

The case fatality rate of 3.5 per cent is worthy of comment, both on its own account as an exceedingly low rate, and as well as an indication of very complete reporting, a fact which may have been obscured by the classification of so many patients as paralyzed

Age and Sex Distribution —The age and sex distribution of the 576 cases reported in 1944 are shown in Fig 4 This demonstrates the observation, which is now commonplace, that the disease is no longer an affliction of infants In the Hornell experience, 7-year-old children were most frequently attacked, and the group from 10 to 15 years old had more cases than the group under 5 years of age There is evidence, too, that if the epidemic had occurred in the district before so many young adult males had been inducted, the number of cases in those from age 15 to 35 would have been appreciably higher For in this group, the normally expected predominance of male cases is reversed, when the calculation is based on 1940 census figures as in the chart. When the withdrawals of men for service in the armed forces are used in reckoning the actual civil population in the district in 1944 by age and sex, male cases actually exceed females by ratios from 1 09 in the 15- to 19-year age group to 2.24 in the 30 to 34 age group

The deaths, in addition to being remarkably few, have an unusual age distribution. Most of the poliomyelitis mortality is expected at the extremes of life, but in the Hornell District in 1944, the adolescent patients were relatively the most apt to succumb, and no deaths at all occurred in those under 7 years of age Patients over 25 years old died less frequently than those from 10 to 20 years of age

Age Distribution According to Environment — Fig 5 demonstrates that age distributions of the cases differ depending on where they occur Thus, relatively more infants and children under 5 were attacked in an urban environment than in

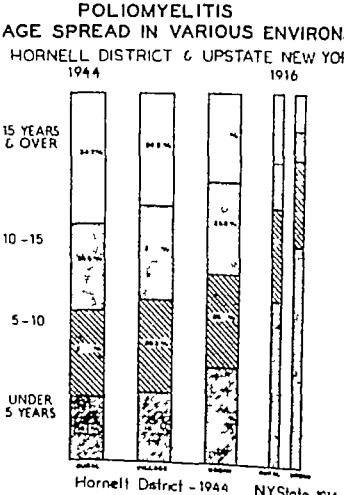

FIG. 5

rural areas, and, conversely, fewer people over 15 were found to be cases in the city than in the country If an intermediate group is chosen, composed of cases reported from villages and suburban areas, its age distribution also compromises the differences between the other two This observation has been made many times before, and is usually explained as due to greater exposure to poliomyelitis virus during the multiplicity of person-to-person contacts in urban environments and a resultant greater immunity among adult city populations.

Dr M. Nicoll analyzed the data for the 1916 epidemic in New York State in the same way with a demonstration of the same differences, as indicated on the chart.[3] However, the striking shift of age incidence to older groups in the 1944 epidemic in the Hornell District compared to that of the epidemic in upstate New York in 1916, a shift which has been noted in other recent epidemics, has had no very satisfying explanation.

Sickness in Poliomyelitis Homes —The diagnosis of poliomyelitis in the absence of frank signs of muscle weakness is a puzzling one and, as previously pointed out, is dependant to a degree on the circumstances surrounding the case, as well as the signs and symptoms presented Thus, a nonparalyzed patient with poliomyelitis is usually reported only when the virus is known

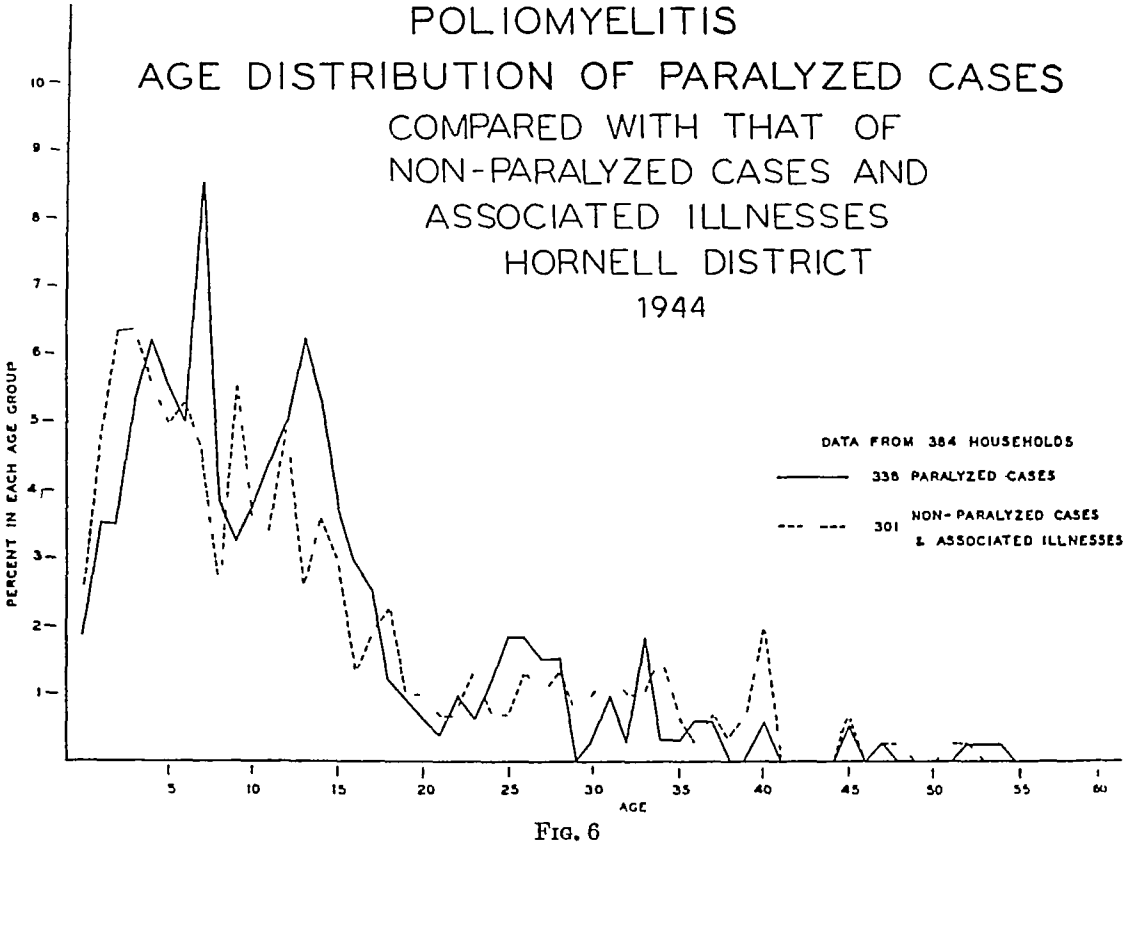

FIG. 6

to be prevalent in a given population and so, to a degree, is an epidemiologic diagnosis It would seem, then, that other phenomena of abortive cases in the mass would be interesting The paper on "Abortive Poliomyelitis" by Paul, Salinger, and Trask[3] included a chart showing curves of age distribution which were roughly a parallel for paralyzed patients with poliomyelitis and for so-called "associated minor illnesses" in the homes of patients The inference that the two clinical entities were manifestations of the same disease was substantiated by the discovery of virus in the oral secretions of the patients with minor illness

It was not possible to complete this final link of evidence in the Hornell District last year, but in 384 homes where poliomyelitis was present, with a gross population count of 1,900, information concerning sickness of all members of the household was obtained A tabulation of these data in Fig 6 shows that, as in the study referred to, the percentage of the total of paralyzed patients in each age group was followed fairly closely by the percentage at each age of non-paralyzed reported patients and "associated minor illnesses" which had fever as a common complaint Most of these "associated minor illnesses" had symptoms either of a gastro-intestinal upset or of an upper respiratory infection A smaller group of patients complained of a headache with their fever, or, in the younger age groups, were merely drowsy or irritable

This is, perhaps, as far as field observations can go to corroborate numerous laboratory studies in which virus has been found in the excretions of contacts as well as of patients

It is interesting to note that in the group of homes studied, about a third of the people were sick, either with diagnosed poliomyelitis or with some feverish malady

Chronology of Sickness in Poliomyelitis Households—The time relationships of onsets of 71 "secondary" cases and 215 "associated minor illnesses" in the home of diagnosed poliomyelitis patients are shown in Fig 7, using as a point of common reference the day of onset of the first diagnosed case This is another device borrowed from Dr J R Paul and his associates, and again, the original work is duplicated For the graph shows a grouping of onsets of minor feverish sicknesses as well as of diagnosed cases of poliomyelitis more or less contemporaneously

Certain statements should be made in qualification of the basic data from which this chart is

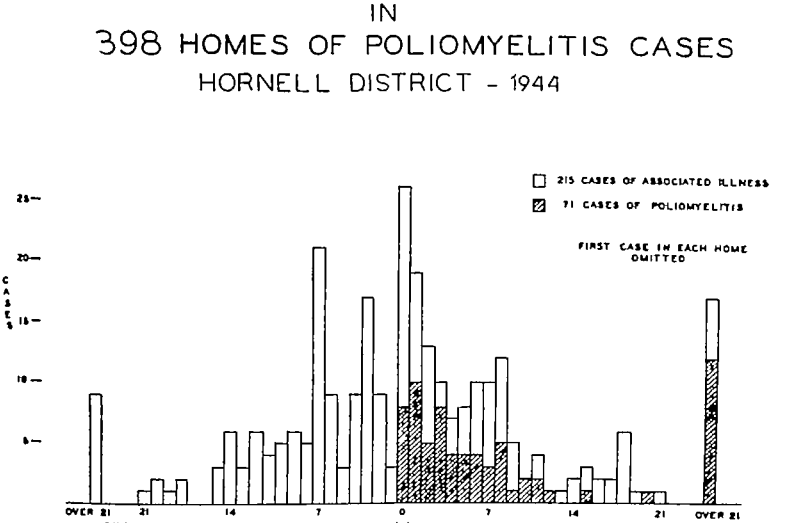

FIG 7

derived First, it should be noted that it was not possible to follow these families closely, and the information was obtained at a single home visit some time after the first case was reported For this reason, inquiries concerning sicknesses before the frank case were answered vaguely at times, and this accounts for the large number of onsets of minor sickness "a week" before. Information concerning sicknesses after the onset of the first case is also limited to the time elapsed between the onset of the case and the time of the visit. And finally, it should be explained that the data on this chart concern the same homes as in Fig. 6 plus fourteen more which are added because of multiple diagnosed cases, although knowledge about the others in these homes is not satisfactory

Even with these admitted limitations, however, it is felt that the analysis has merit. Certainly, the chronology of the reported secondary cases is valid, and seems to show a regular curve of fewer and fewer cases the longer the interval between the first case and the second in the home No regular interval between household cases or even a majority of them can be detected and there is no clear indication of which are due to chance variations of incubation period, and which are truly secondary Perhaps those cases which occurred three weeks or more after the first reported case may be considered as obviously secondary, but it is possible to wonder whether even they too may not be part of the same basic curve. Long incubation periods (up to forty-three days) have been demonstrated in the laboratory and no one knows how often the virus behaves similarly in humans

As mentioned, the information concerning minor illnesses in the homes was obtained at a single visit, usually about two weeks after onset of the first reported case As such, the information is historic, and hence, less valid for the earlier data. But even if this criticism is taken into account, the chart suggests a pattern of normal distribution about a point. If this observation has any validity, it implies that households are affected as units and the various members of families are infected simultaneously The difference in dates of onset of sickness could be explained as varying according to dosage or susceptibility with observed onsets falling into a familiar statistical figure when pictured in a graph.

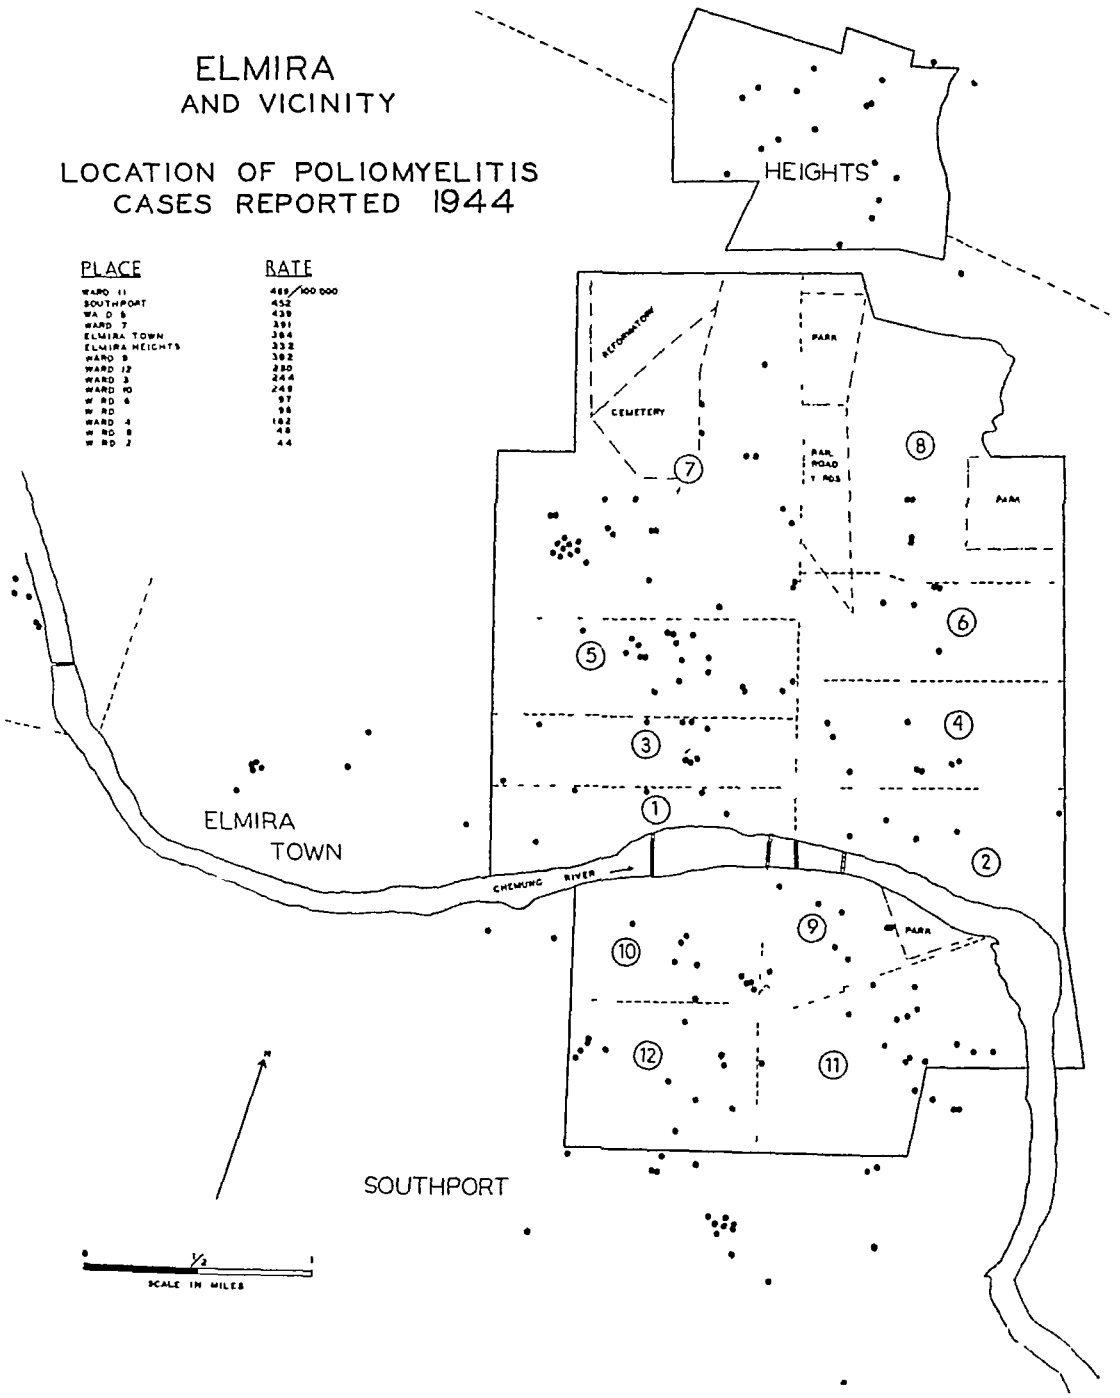

FIG 8

Case Contacts

There is general agreement that attempts to trace one case of poliomyelitis to another as a means of demonstrating a chain of infection are not usually very impressive In addition, such investigations are always criticized as inconclusive, since they neglect the healthy and sick carriers known to exist in any epidemic area Nevertheless, during the visits to the homes of each patient with poliomyelitis, information was obtained whenever possible to determine contact with other patients As already discussed, 71 cases occurred in the homes of patients with previously existing reported cases, in addition, 108 extrahousehold contacts were found Eliminat-

ing ten duplications between the two groups, a total of 169 patients gave histories of contact with previously reported patients, or more than 28 per cent of the 581 patients in the entire epidemic. A percentage as high as this of traced contact between poliomyelitis cases is believed possible only in rural areas with stable populations and placid social habits

However, when supplementary information concerning those contacts is obtained, difficulties are encountered in determining which of them should be considered infective and which not. For instance, 85 of the extrahousehold contact were with incubating cases, 17 with convalescents, and only 7 with persons having acute cases The latter two categories are known to have virus in respiratory and intestinal tracts, but the status of incubating cases as vectors of the virus is not so clear A tabulation of extrahousehold contacts according to time indicates that eighteen of them occurred within four days of onset of the "secondary" cases and in succeeding spans of four days, there were thirteen, eleven, seventeen, and six Sixteen of the extrahousehold contacts were more than twenty-one days prior to the onset of the second case and the remainder (twenty-seven) were repeated contacts

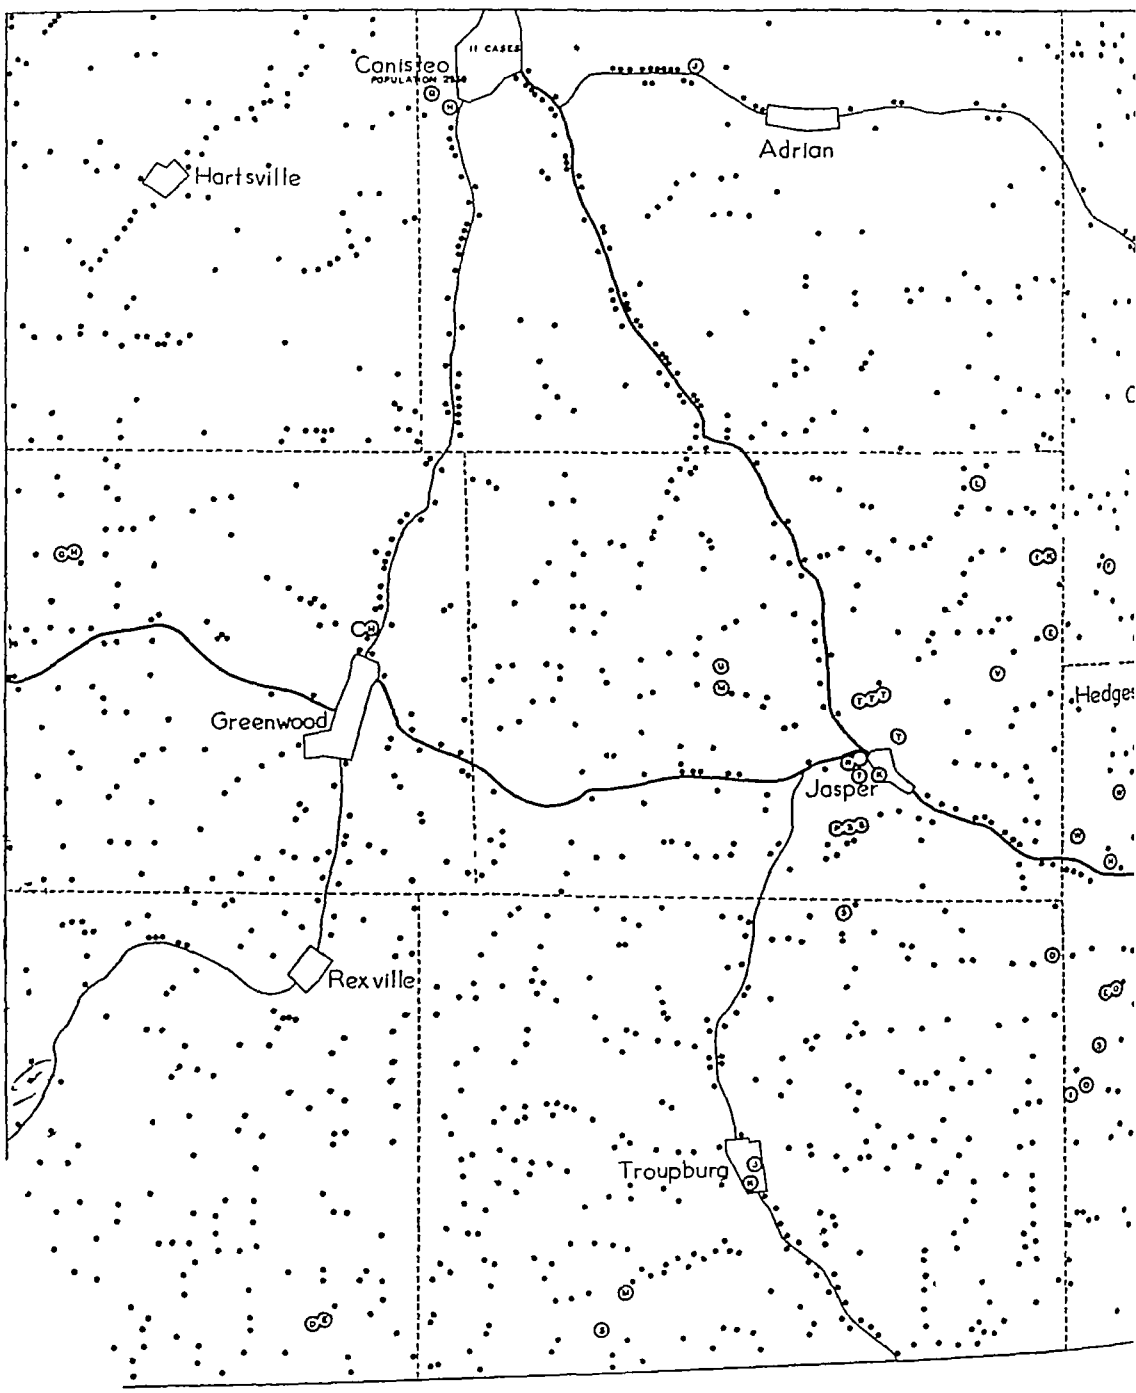
With the exception of this last group, all of these contacts must be interpreted in the light of knowledge about the incubation period of the disease, a vague guide at best In any case, if these contacts are significant, and if there is a usual incubation period for poliomyelitis, one would expect a grouping of them in some time period prior to onset of the disease in the contact. This is not apparent in the material presented If the criteria of another recent study[4] of an epidemic of poliomyelitis are adopted, only those contacts occurring from four to fourteen days prior to the onset of the exposed case would be considered significant. In this study, contact during that period totaled 42, which, added to the repeated exposures, would bring the sum of extrahousehold contacts to 69 There were 22 secondary cases in homes with poliomyelitis during the same interval, bringing the total percentage of contacts, both intra- and extra household, to previous cases during the interval from four to fourteen days before the onset of the second case to 15 4 per cent. This proportion does not seem impressive, when the extent of intermingling of populations, both rural and urban, is taken into account

Neighborhood Grouping of Cases

The significance of histories of contact of patients with poliomyelitis with pre-existing ones should be considered in relation to who and where these contacts are. Fig 8 gives in detail the location of cases in Elmira. On the map can be seen definite "nests" of cases in particular neighborhoods, as well as a more generalized distribution One of these groupings occurred in a large housing project

It is to be expected, and it is true, that many of these neighborhood patients gave a history of contact with other poliomyelitis patients in the vicinity Person to-person spread of the disease may explain such a distribution On the other hand, sceptics might say that neighborhood patients share a great many other things in their environments besides respiratory or intestinal-tract flora

Rural Grouping of Cases—Southern Steuben County



In Fig 9 an attempt has been made to locate in time as well as space the cases occurring in the severely involved section of Southern Steuben County Here again, neighborhood groups of cases can be found, some with onsets at intervals from one another, others with surprisingly close onsets in time It is believed that such neighborhoods should be studied in detail to determine whether, in fact, person-to-person contact is the only way to explain the high incidence of poliomyelitis in them

This detail map also shows clearly a peculiar fact—that with the exception of a few patients in one corner, one who lived alternate weeks in Hornell, and another who moved from Woodhull while she was sick, the town of Jasper—adjacent to Woodhull, so seriously and early affected by the epidemic—had no cases until the third week of September

Animal and Insect Contacts

About 1 patient in 5 gave a history of contact with cattle, with horses, fowl, rats, and mice Slightly less than two thirds had cats or dogs in the home As would be expected, all types of animal contacts were more frequent in rural areas, where incidentally, practically 90 per cent gave a history of contact with cats

The senior author's report of the outbreak of poliomyelitis in Tompkins County in 1916[5] suggested that cat fleas be investigated as a means of spread of the disease. Since then many additional facts have been discovered about poliomyelitis and its behavior in population groups, and though insect vectors, particularly cat fleas, are not generally believed to be concerned in the spread of the disease, the fact remains that this insect is prevalent seasonally, geographically, and locally where poliomyelitis occurs The cat flea, Ctenocephalus felis, is found as a parasite of cats in temperate climates from early in the spring to late in the fall and, on occasion when cats

TABLE 1.—POLIOMYELITIS INCIDENCE IN RURAL AND URBAN AREAS OF THE HORNELL DISTRICT, 1944, COMPARED WITH CAT CENSUS

	Population per Square Mile	Poliomyelitis Case Rates, 1944, per 100,000 Population	Percentage of Homes with Cats, Estimated
Rural area	25	323	76
Villages	1,500	214	39
Cities (Hornell, Corning Elmira)	5,000	287	30

are warmly and closely housed in the winter, it may exist throughout the year The cat flea does not occur extensively in equatorial climates, but reports indicate that it is now more prevalent than twenty years ago in the southern United States

A survey made during the latter months of the outbreak in the Hornell District of an unselected group of homes visited by public-health nurses shows that 76 per cent of 187 farms maintained cats, whereas the percentage in urban homes was only 30 per cent This higher incidence of cat contact in rural environments corresponds to the more severe involvement of rural areas in most poliomyelitis epidemics In the experience of the Hornell District in 1944, this correlation is indicated in Table 1

Although the investigations made at the homes of the poliomyelitis patients do not show cat contact for all cases, nevertheless it is known that fleas dropped from cats are more liable to bite humans when not on their usual hosts There may have been no reaction to the bites or all evidences of them may have disappeared before the onset of the disease It is known that only about one person in eight shows any reaction to flea bites

An attempt was made, in view of these facts, to investigate the possibility that cat fleas served as vectors of poliomyelitis virus during the epidemic About two thousand fleas were collected from cats in the vicinity of cases These were pooled for injection into animals at the Yale Poliomyelitis Study Unit through the courtesy of Dr J R Paul No poliomyelitis virus was found in these pools, however, the results are not considered conclusive It would be interesting to see the effect of D D T , as an agent to control fleas, on the progress of a poliomyelitis epidemic

Supplementary Information

Information concerning several factors of possible importance in the spread of poliomyelitis was obtained during the visits to the homes of cases

However, nothing of significance was discovered concerning the relationship to poliomyelitis of sanitation of the surroundings of patients and no evidence was discovered to indicate water or milk-borne poliomyelitis There were many more flies than usual early in the epidemic, but as the summer progressed, the number of flies diminished without appreciable effect on the course of the epidemic About 50 per cent of the patients gave a history of insect bites of one sort or another

Only 4 of the patients, none with the bulbar type, were found to have had tonsillectomies during 1944 Twelve of the patients were pregnant

Summary

Facts concerning the clinical and epidemiologic features of an outbreak of 591 cases of poliomyelitis in a three-county district of New York State with a population of about 200,000 have been presented

Criteria for diagnosis have been discussed, and limitations of spinal-fluid cell counts pointed out

More than one such examination in eight for reported cases revealed normal counts, and few of these patients with normal counts were non paralytic A tabulation of patients by extent of involvement during the acute stage shows that 3 5 per cent died and 17 per cent more who survived had bulbar involvement, 10 per cent were severely paralyzed, 27 per cent moderately, 16 per cent to a minimal extent, and 22 per cent were not at all paralyzed

The spread of the disease in many directions from a central focus has been traced and diminishing attack rates noted on the periphery of the area involved Exceptions to this generalization have been pointed out, particularly the late appearance of the disease in a town adjacent to the center of the epidemic where the attack rate among the general population approximated 5 per cent An attack rate of 474 per 100,000 population in the rural areas affected was contrasted with an average rate of 287 per 100,000 in the three cities of the district

The rapid rise in incidence of reported cases of poliomyelitis to a peak during the third week of July has been indicated and a gradual, even decline noted thereafter Age distribution of cases shows most cases at 7 years, with more cases in the ten- to fifteen-year age group than in those under 5 years The frequent occurrence of minor illnesses with fever in the homes of patients has been shown, and the age distribution and chronology of these patients compared with reported cases Contacts between patients have been traced in 28 per cent of the reported cases and comments made on the significance o finding

Conclusions

Most of the standard tabulations of the epidemic in the Hornell Health District last year conform with those of other recent outbreaks of poliomyelitis, and such data have been interpreted to indicate that the usual mode of spread is by means of person-to-person contact. However, this study has emphasized for the authors that the accepted explanation of the spread of poliomyelitis is based on the weight of the evidence, and that some of the observations reported here do not fit nicely into the theory that poliomyelitis is usually spread by person to-person contact

For instance, this epidemic showed no particular correlation of cases with the distribution of presumptive susceptibles, no clear-cut evidence of spread of the disease from one member to another in families could be detected, and contacts with previously existing cases could be interpreted in this experience as a matter of chance The possibility of an insect vector as an agent in the spread of poliomyelitis is suggested by the seasonal incidence of the disease. Data have been presented showing that the cat flea is at least one insect whose distribution can be correlated closely, both seasonally and geographically, with the incidence of poliomyelitis.

The lack of public-health virus laboratory facilities seriously handicapped the investigation reported here and made impossible any extensive search for virus in patients or their environments We believe that such virus laboratory facilities should be provided, not just for the purposes of more thorough investigation of poliomyelitis epidemics but for more detailed study of all the virus diseases which affect humans

The theory of person-to-person spread of poliomyelitis, we feel, must be considered in the nature of a diagnosis by exclusion, and we agree with some other students of the problem that its firm establishment depends on a more thorough elimination of other possible explanations of the epidemiology of poliomyelitis

Acknowledgments—Most of the material presented in this paper would have been impossible to obtain without the continuing active cooperation of the practicing physicians of the Hornell District. Their contributions were most important. Acknowledgment is also gratefully made to Drs. J R. Paul and R. F Korns for their helpful suggestions and criticisms

THE MEDICAL IMPLICATIONS OF THE ATOMIC BOMB

Some of us remember when the roentgen rays were discovered. The very obvious penetrating quality of the new form of energy was studied and various uses were made of it. It was some time before we were aware that x rays had other almost unbelievable powers. The effect upon living tissue was both stimulating and destructive, depending upon the dosage and screening Furthermore, there was some selectivity, depending upon the structure of the tissue involved. Before this was learned many pioneers in the field of radiology became sterile lost fingers or limbs and some even lost their lives. When radium was discovered the scientific world was ray-conscious and there were fewer disasters. Nevertheless we still have radium and x-ray "burns" which are difficult to heal. In fact they behave in a way entirely different from injuries caused by heat that is produced by oxidation.

For this reason the first reports from Hiroshima of rescuers being stricken when they entered the devastated area did not sound too fantastic. The greatest obstacle to believing them was that they were Japanese reports We are now getting reports from American sources. Vern Haugland gives an interesting account of Hiroshima and it happened that one of his interpreters was a Japanese physician. He has something to say about the injured The bomb was exploded over Hiroshima at a height of from 1,000 to 1,500 feet. For this reason the surface of the earth was not rendered radioactive, as was the case with the experimental bomb in Arizona which was set off at a height of 100 feet. The death toll at the time of Haugland's visit had mounted to 53 000 and it was expected to reach 80 000 eventually Many persons who were only slightly wounded died from no apparent cause and any who were shocked by the atomic bomb were in danger of external or internal hemorrhages. Even slight scratches or burns were apt to become seriously infected.

The situation offers a wonderful opportunity for investigation in pathology Those who were killed instantly were probably so completely destroyed that there is no hope of learning anything about the effect of atomic energy upon living tissue from that source The late and secondary deaths should give a clue Furthermore those who have been exposed to the blast and who are still living should be subjected to careful clinical study No one can predict what the future holds in reference to atomic energy, and no opportunity should be lost for studying its effect upon human beings.—*Virginia M Monthly Oct 1945*

DIAGNOSIS AND MANAGEMENT OF CERTAIN TROPICAL DISEASES IN RETURNING VETERANS

WILLIAM KAUFMANN, M D , Albany, New York

(From the Departments of Medicine, Pathology, and Bacteriology of the Albany Medical College and the Albany Hospital)

THE deployment of American troops over the entire world in areas where modern methods of sanitation are unknown or poorly applied has made it inevitable that numerous men and women of our armed forces should come into contact with infectious diseases heretofore not encountered in our own country Many of these infectious diseases are acute in nature, producing severe illness, usually of short duration When properly treated these diseases clear up without leaving noticeable aftereffects Others, however, while sometimes acute in onset, are actually chronic and run a protracted course, even when symptomatic treatment is given Still others of these diseases are apt to relapse more or less frequently, in spite of the fact that specific treatment produces apparent clinical cure

The symptomatology of these diseases is often varied and confusing Chills, fever, malaise, and nausea, frequently accompanied by vomiting, generalized aches and pains, delirium, and unconsciousness are only a few of the general symptoms encountered This complexity of symptomatology makes it necessary that diagnostic means other than a recording of clinical symptoms be looked for to help in arriving at a correct diagnosis Fortunately, it can safely be said here that nowhere else in the field of medicine is the aid of the laboratory so essential and so helpful as in the field of tropical medicine and parasitology, and the diagnosis of a tropical or parasitic ailment is essentially a laboratory diagnosis

Most infectious diseases are cosmopolitan because the causative, infectious agent is not completely dependent for life on climate, surroundings, or intermediate hosts requiring special environmental conditions However, a fair number of infectious organisms thrive better in warm and humid climates than in cool or temperate zones, and often they require for the completion of their life cycle intermediate animal or plant hosts not commonly found in temperate climates There are many such infectious agents, but of these relatively few are of major importance in the production of human pathology One of the reasons is that many are adapted for parasitic life only in animal hosts and rarely, if ever, attack man Another reason is that contact with human beings is difficult or accidental so that infections resulting from contact with such organisms are rare Possibly the major reason for the relatively rare occurrence of parasitic infections in our own troops is the selection of carefully controlled public-health methods by the armed forces and strictly enforced preventive medical practices Yet, in many instances, contamination cannot be avoided, especially with those micro-organisms which are transmitted by vectors so numerous in endemic areas that complete protection is impossible

In Table 1 an attempt is made to group together the most frequent infectious diseases of warm and humid climates

The majority of the bacterial, virus, and rickettsial diseases are essentially acute and because of this they will not present a diagnostic problem in the returning veteran This leaves the protozoan and helminthic infections, most of which are insidious in onset and protracted in their course These are the diseases which the physician will have to suspect in any veteran who has lived in areas in which certain parasites are endemic and who complain of symptoms not readily explainable on clinical grounds In the following I shall attempt to give a brief description of certain ways and means of making accurate diagnoses of these diseases as well as methods of treating those tropical ailments which we are most liable to encounter in returning veterans

Amebiasis

This world-wide disease, prevalent in both warm and humid climates, is caused by Endamoeba histolytica, a rhizopod protozoan which affects primarily the large intestine The life cycle of the parasite is simple, requiring only one host The cyst of E histolytica is the resistant and infective form of the parasite and is responsible for the transmission and the propagation of the disease Cysts usually possess one to four nuclei, although eight-nucleated forms have been reported When ingested, cysts pass unharmed through the stomach and small intestine but excyst in the region of the ileocecal valve After excystation, freed trophozoites, the vegetative forms of the parasite, attack the mucosa of the large intestine, multiplying by simple, binary

Read at the Thirty-ninth Annual Meeting of the Sixth District Branch of the Medical Society of the State of New York, Cortland September 26, 1945

fission and producing ulceration of the mucosa by tissue lysis Characteristic inverted, flask-like ulcers are formed, with the neck and mouth of the flask pointing toward the lumen of the intestine and the bottom buried deep in the submucosa This accounts for the small, often pinpoint-sized ulcers seen through the sigmoidoscope These ulcers are actually more extensive and destructive in the submucosa than the sigmoidoscopic findings would indicate Trophozoites constantly escape from these ulcers, are swept downward by the fecal stream, and attack the intestinal mucosa wherever stasis occurs Thus, lesions are most frequent in the cecum and in the rectum, but may occur anywhere in the large intestine Trophozoites disintegrate rapidly when passed to the outside world, and continue to live only within the tissues Transformation of trophozoites into cysts thus occurs within the intestinal lumen and not in the tissues

When the cysts are passed from the intestine they may remain alive in feces at room temperature for several weeks. Freezing does not harm them for about one year, but temperatures over 50 C are fatal for them within three to five minutes

Clinically, amebiasis is primarily a colitis characterized by frequent dysenteric stools, tenesmus, anorexia, indigestion, loss of weight, and dehydration. In general the symptomatology of amebiasis in temperate climates is rather vague and the onset, in contrast to bacillary dysentery, is insidious While symptoms may occur within two weeks after infection, especially in hot and humid climates, it is more common for the incubation period to last for a month or longer The patient's temperature is often normal or only slightly raised and there is no leukocytosis These findings are in contrast to acute bacillary dysentery

Diagnosis depends entirely upon the finding of the parasites in the feces Special precautions are necessary to preserve trophozoites in the stools in order to demonstrate their structure and their characteristic, explosive "ameboid" movements Both their movement and their structure differentiate them from the harmless E coli, a frequent saprophyte of the human intestine. Several methods of stool examination have been devised and should routinely be employed to increase accuracy of diagnosis Identification of these micro-organisms should only be attempted by skilled, well trained personnel, since confusion of typical and atypical forms with large epithelial cells, macrophages, and harmless intestinal protozoa, or even fungi, is altogether too common

The course of amebic colitis in the absence of specific treatment is protracted and is characterized by alternating periods of remissions and relapses In many instances diarrhea and dysentery may persist for months, resulting in considerable dehydration and prostration of the patient In other cases dysenteric or diarrheic attacks may alternate with periods of constipation

The real dangers of chronic amebic colitis lie, of course, in the production of permanent damage to the large intestine produced by the extensive ulcerative lesions, in the possibility of sudden perforation with consequent peritonitis, and finally, in the development of metastatic infection, such as liver, lung, and brain abscesses Hepatitis is a frequent complication of amebic colitis and may occur early in the disease It is not always associated with liver abscess, however

Treatment.—Amebiasis therapy is specific and depends on the clinical symptomatology of the illness Patients with dysentery, hepatitis, or liver abscess should be hospitalized and kept in bed Patients with mild symptoms or with no clinical symptoms at all, as well as carriers, may be treated as office patients

The following specific drugs are available for the treatment of amebiasis

1 Emetine hydrochloride
2 Diodoquin
3 Chiniofon
4 Vioform
5 Carbarsone

Emetine hydrochloride is the drug of choice in amebic hepatitis, liver abscess, and other metastatic amebic infections and should be employed in all cases of severe amebic dysentery until the symptoms are controlled It should then be followed by one of the iodine preparations Emetine hydrochloride is administered sub-

cutaneously or intramuscularly in daily doses of 0 065 Gm Not more than six to eight daily doses should be given Emetine hydrochloride should not be considered a curative drug, since about 81 per cent of patients who have received one or two courses of treatment with this drug and whose fecal specimens have shown no parasites have become positive again within forty days after cessation of the treatment (Craig) [1]

Diodoquin (5,7-diodo-8-hydroxy-quinoline) contains 63 9 per cent iodine and has been found to be a very effective drug in the treatment of all forms of amebic colitis, once the severe dysentery has been controlled It is administered orally in the form of 0 21-Gm tablets six to nine times daily for twenty-one days Toxic symptoms, except for occasional slight headache, have not been reported

Chiniofon, also known as anayodin or yatren, contains 28 per cent iodine (iodoxy-quinoline sulfonic acid) It is a good substitute for diodoquin and should always be given when two full courses of diodoquin have failed This drug is administered orally in doses of 0 25 Gm in pill or tablet form three times daily for seven to ten days The course may have to be repeated after an interval of two weeks

Vioform (iodochlorhydroxyquinoline) contains between 37 5 and 41 5 per cent iodine It is administered three times daily in 0 25-Gm gelatin capsules for ten days After an interval of one week the same course is repeated Serious toxic reactions to this drug have rarely been noted

Carbarsone (4-carbaminophenylarsonic acid) contains 28 85 per cent arsenic It is a more toxic drug than all the others but is very efficient in the treatment of the disease It should be used when other medication has proved unsuccessful It is given orally in gelatin capsules, containing 0 25 Gm of the drug, three times daily for ten days The treatment may be repeated, if necessary, after an interval of ten days Carbarsone has proved very valuable, especially in the treatment of carriers, but it possesses the disadvantages of the toxicity of the arsenicals The usual precautions against arsenic intoxication should be employed and the drug should not be given if arsenical treatment is contraindicated for reasons of concomitant organic liver or kidney diseases

Supportive treatment in the form of high-caloric diets and vitamin therapy may be necessary Constipating drugs or laxatives are generally contraindicated, since they may interfere with the proper action of the amebicidal drug Severe anemia may require specific treatment once the infection has been checked

Patients should return periodically for check-up stool examinations Monthly stool examinations for three to six months should insure permanent cure if no recurrence has occurred meanwhile Relapses should be treated as the initial attack

Malaria

This serious and world-wide disease is due to infection of the red blood cells with one of four hemoparasites

1 Plasmodium vivax
2 Plasmodium malariae
3 Plasmodium falciparum
4 Plasmodium ovale

The disease is really a parasitemia characterized by periodic destruction of red blood cells accompanied by chills and fever and producing serious anemia

Malaria produces such a variety of symptoms that a clinical diagnosis is often impossible to make, and any person who recently resided in areas in which the disease is endemic and suddenly complains of chills and fever should be suspected of having malaria until it is proved otherwise The scope of this paper does not permit a detailed discussion of the often complicated symptomatology of the various forms of malaria The typical periodicity of chills and fever, contrary to general belief, is not always established in the first few days of the clinical infection and therefore fails to be of help in early diagnosis Suffice it to say, then, that in case of sudden chills and fever in a returning veteran immediate hemodiagnosis should be resorted to in order to establish or rule out a diagnosis of malaria Antimalarial therapy without confirmation of the disease by blood films is a dangerous practice, since one always runs the risk of missing a serious nonmalarial infectious disease such as meningitis or pneumonia

As with other parasitic infections, correct diagnosis thus depends on the identification of the causative micro-organism in the laboratory Species diagnosis is essential, since patients suffering from falciparum infections should be watched carefully for the development of complications, such as cerebral malaria and blackwater fever Also, it should be remembered that falciparum malaria is not liable to cause repeated relapses, while vivax malaria characteristically produces frequent recurrences in spite of specific antimalarial treatment These recurrences can be brought under control readily and are not apt to result in serious complications

In order to understand symptomatology and methods of diagnosis as well as treatment of malaria knowledge of the life cycle of the parasite appears essential The life cycle of all four species of Plasmodia is identical and is conveniently divided into two main parts, namely,

the asexual cycle, or schizogony, occurring in man and responsible for the clinical symptomatology of the disease, and the sexual cycle, or sporogony, occurring in the mosquito and responsible for the production of the infective, mosquito-borne forms of the parasite When a female mosquito takes a blood meal she injects into the human circulation sporozoites (infective forms) which disappear from the circulation for several weeks, probably being carried in reticuloendothelial cells After a period of intracellular residence (exoerythrocytic phase) young ring forms, or trophozoites, appear in the red blood cells of the circulating blood These trophozoites show ameboid movement of their cytoplasm and their nuclear chromatin begins to divide The parasite is now known as a schizont and within a short time enlarges so as to occupy the major portion of the red blood cell Division of the nuclear chromatin continues until a certain number is reached, at which time the term "merozoite" is applied to each of the nuclear divisions and their tributary cytoplasm When the full number of merozoites is reached the parasitized red cells rupture and the thus liberated merozoites attack other red cells to repeat the cycle This cycle is called schizogony and varies in duration with the species, requiring forty-eight hours for Plasmodium vivax and ovale, seventy-two hours for P malariae, and twenty four to thirty-six hours for P falciparum

Some of the merozoites, originating from several generations of asexual forms in the red blood cells, develop into sexual forms, the so-called gametocytes, which enlarge and almost fill out the entire red cell The latter finally ruptures and allows the gametocytes to flow free in the plasma Female gametocytes are called macrogametocytes and the male forms are called microgametocytes

During a blood meal these gametocytes are taken up by the female mosquito and as soon as they reach the midgut of the insect, after further structural changes in the parasites, fertilization occurs. The male organism exflagellates and each of the flagellate organisms penetrates one macrogamete. The form resulting from this union is referred to as a zygote The zygote then changes into an elongated body, the ookinete, which penetrates the wall of the midgut. In the intestinal wall it comes to rest and develops into a spherical structure, the oocyst, within which are produced numerous slender fusiform elements, the infective sporozoites The oocyst finally ruptures and liberates the sporozoites, which escape into the hemocele of the mosquito, from which they are attracted to the salivary glands Here they are stored until the insect is ready to take another blood meal, when they are injected into man to start the asexual cycle The sexual cycle is called gametogony and sporogony and varies in duration from ten days to four weeks, depending on climate and surroundings in which the mosquitoes live

Identification of the species of malarial parasite requires experience and should be attempted only by trained personnel, since confusion with blood platelets, molds, and bacteria growing on blood films with parasites is frequent. The Army requires periodic checking of its technical personnel by a competent laboratory officer

Thick and thin blood films are the diagnostic methods of choice, and such films should be made on each patient suspected of having malaria The thick film serves to insure a diagnosis of malaria, while the thin film allows for species identification Thick films should be carefully examined for at least five minutes and thin films for thirty minutes before being discarded as negative

Staining of the films may be done by any of the modifications of the Romanowsky method, the ordinary Wright's or Giemsa's stain being quite satisfactory Recently Field's method[2] has been found to be very helpful

Treatment.—The treatment of malaria is primarily directed toward sterilization of the blood from parasites and the prevention of relapses While the former is possible in almost all cases treated properly, the latter is extremely difficult and presents one of the unpleasant problems with our present-day antimalarial drugs. Several methods of treatment are recommended, but for the purpose of this paper only one form of treatment, namely, the so-called curative treatment is felt worthy of consideration The so-called suppressive treatment is a prophylactic treatment and is reserved for military or civilian personnel entering or residing in endemic areas It is therefore of no consequence in the treatment of returning veterans or in civilians having acquired the infection either here or abroad Several excellent drugs are available, and one or the other should be employed as soon as the diagnosis is established Patients with falciparum malaria should be hospitalized for the duration of the treatment, while those with other forms of malaria may be treated on an ambulatory basis except in complicated cases

Atabrine (quinacrine hydrochloride, U.S P XII) is today considered the drug of choice in all cases of malaria and has been found to be very efficient. It is administered orally in tablets of 0 1 Gm Uncomplicated cases should be treated in the following manner 0.2 Gm. of atabrine is given every six hours for five doses, to make a total of 1 Gm in thirty hours Then one continues with 0 1 Gm three times daily for six days

to make a total of 2 8 Gm All ordinary cases of infection should be clinically cured after this treatment Some authors recommend the use of equal amounts of sodium bicarbonate with each dose of atabrine

Since atabrine does not usually kill the gametocytes of P falciparum, plasmochin therapy should follow atabrine treatment as indicated below

In cases where oral administration is not possible, as in pernicious vomiting or in cerebral malaria, atabrine hydrochloride may be administered intravenously or intramuscularly However, it is generally felt that quinine dihydrochloride, given intravenously, is to be preferred in such cases, since intravenous injection of atabrine hydrochloride has in a few cases produced instant collapse and death The intramuscular injection of atabrine hydrochloride generally produces less tissue necrosis than quinine dihydrochloride The recommended dosage for intramuscular or intravenous atabrine hydrochloride is 0 2 Gm in 10 cc of sterile distilled water, to be repeated if necessary in six hours by one other injection Oral treatment with atabrine should then be instituted as soon as the patient regains consciousness or stops vomiting

Quinine is a specific antimalarial drug and its salts, quinine sulfate for oral administration and quinine dihydrochloride for intramuscular or intravenous injection, would eventually eliminate malaria in any given patient However, treatment would have to be prolonged and since most patients will not carry on, strictly, frequent relapses are common in cases treated with quinine

Numerous forms of treatment with quinine have been devised, the one recommended by the National Malaria Committee in 1918 having given good results In cases of acute attacks quinine sulfate is given orally in doses of 0 65 Gm three times daily for four days, or until the acute symptoms are controlled Following this 0 65 Gm is given nightly for eight weeks In cases of parasitemia without acute clinical symptoms the latter part of the treatment only is necessary.

Intravenous administration of quinine dihydrochloride should be reserved for cases of pernicious malaria with biliary vomiting or cerebral manifestation The following dosage should be employed 0 65 Gm to 1 Gm of the drug should be diluted in at least 200 to 250 cc of sterile normal saline and injected very slowly into the vein If no relief of symptoms is obtained within six hours the procedure should be repeated or should be followed by one intramuscular injection of atabrine hydrochloride in the dosage given above It has recently been found that if human blood plasma is substituted for the diluent, better results are obtained with one injection, and the fall in blood pressure is less serious

Intramuscular injection of quinine dihydrochloride is often complicated by local tissue necrosis and thus has been replaced by atabrine hydrochloride Oral administration with quinine should be instituted as soon as the condition of the patient permits

Totaquine is a mixture of the alkaloids of cinchona and has proved a valuable substitute for quinine Dosage and administration are identical with those for quinine However, it has no advantage over atabrine or quinine and thus is relegated to a secondary role in the treatment of malaria

Plasmochin is the gametocidal drug of choice, although some dispute as to its specific value still exists However, recently the Director of the Medical Services, Middle East Forces, British Army, 1942, stated that plasmochin not only kills the gametocytes but also reduces the relapse rate, presumably acting on the exoerythrocytic forms which survive during the latent period [3] Plasmochin is administered after treatment with atabrine or in conjunction with quinine in the form of a 0 01-Gm pill three times daily for four to five successive days, or 0 01 Gm three times daily every third or fourth day until the gametocytes disappear Since it is a toxic drug its use should be supervised carefully and it should never be given in conjunction with atabrine

Once the acute attack of malaria has been clinically cured and the parasitemia checked, the convalescent patient may require supportive treatment In general the frequently present anemia will respond favorably to liver and iron therapy Only in rare cases will blood transfusion be necessary Relapses, occurring so often with vivax malaria, should be treated as the initial attack With proper treatment they will become less frequent and finally not recur

Leishmaniasis

This disease is found throughout the tropical and subtropical belt of the globe and is caused by a protozoon of the genus Leishmania There are several species of Leishmania, three of which are pathogenic for man, namely

1 Leishmania donovani, causing visceral leishmaniasis, or kala-azar

2 Leishmania tropica, causing cutaneous leishmaniasis

3 Leishmania brasiliensis, causing mucocutaneous leishmaniasis

Differentiation of these three species is based largely on clinical and pathologic grounds and

not on parasitologic findings All three species are transmitted from man to man by an intermediate host, a small sandfly of the genus Phlebotomus. The micro-organisms are parasites of the reticuloendothelial system of the body, parasitizing especially the reticuloendothelial cells of the liver, spleen, and bone marrow in kala-azar, and the skin and subcutaneous tissues in cutaneous and mucocutaneous leishmaniasis.

The onset of the disease is insidious, ranging from several weeks to over one year after infection The symptomatology is very complex, fever of a continuous type with slight daily remissions or occasionally double or even triple peaks being present for days or weeks, especially in the beginning of the disease Ulcerations of the skin and mucocutaneous junctions in patients returning from endemic areas are suggestive of cutaneous leishmaniasis Hepatosplenomegaly in the absence of malaria should make one suspect kala-azar This latter form of leishmaniasis is often characterized by extensive weight loss, prostration, and abdominal protrusion Frequently enlargement of lymph nodes without specific distribution is noted The course of the disease is protracted and progressive and in kala-azar ends fatally within two years if no treatment is instituted

Diagnosis again depends largely on the demonstration of the micro-organisms, although serologic tests have been devised which have proved valuable aids in diagnosis, and blood findings in kala-azar are thought to be quite characteristic There is generally leukopenia, especially a decrease in the number of granulocytes Anemia sets in rather early and often is of the hypochromic type The sedimentation time is generally increased

Significant are the changes in the plasma proteins There is a reversal of the albumin-globulin ratio with a rise in the globulin fraction, beginning early in the disease and reaching as high as 8 Gm per 100 cc. These findings have led to several so-called qualitative tests for leishmaniasis which have proved helpful in the diagnosis but which have not replaced the parasitologic examinations In addition some of these tests have been found to be positive in other parasitic infections.

Therefore, conclusive diagnosis rests upon the demonstration of the causative micro-organism in blood films or in cultures made from the blood of patients suffering from leishmaniasis The parasites are usually found in the cytoplasm of reticuloendothelial cells and leukocytes in the blood, but in kala-azar they may be discovered in almost any organ of the body Sternal and splenic punctures are especially helpful and smears should be stained with any of the modifications of the Romanowsky method

Culturing of Leishmania organisms has been perfected thoroughly and should always be attempted simultaneously with direct blood examination The N N N (Nicolle, Novy, and McNeal) medium has proved most satisfactory and the development of the parasite may readily be studied in such cultures

Treatment—Since the introduction of the pentavalent antimony compounds in the treatment of kala azar, the prognosis of this disease has lost much of its serious aspects, while for the other forms of leishmaniasis trivalent antimony preparations, such as sodium or potassium antimony tartrate and fuadin, are still the drugs of choice.

Neostibosan, containing about 40 per cent of antimony, is administered either intramuscularly or intravenously It is the least toxic of the pentavalent preparations and therefore is especially valuable in the treatment of kala-azar

Napier advises the following intravenous adult dosages 0.2 Gm the first day, 0 4 Gm. the second day, 0 5 Gm the third day, to be continued daily for twelve injections in infections contracted in India, eighteen injections for cases contracted in China, twenty-four injections for infections contracted in the Mediterranean area, and at least twenty-four injections for infections contracted in the Sudan

Toxic manifestations due to injection of any antimony compound will have to be watched for and include irritation of the respiratory epithelium with coughing, headache, and vomiting, bradycardia, and finally pneumonia The latter, serious toxic complications, require interruption of the treatment.

Certain diamidine compounds have been found to be valuable in the treatment of kala-azar in the Sudan and in British East Africa. However, Napier, Sen Gupta, and Sen[4] recommend that these drugs be used only in the rare cases refractory to neostibosan because of the high degree of toxicity of diamidine compounds.

For the treatment of cutaneous and mucocutaneous leishmaniasis fuadin is probably the most efficient drug It contains 13.5 per cent of antimony and is given preferably in intramuscular injections Two injections of 5 cc should be given biweekly and continued for eight weeks Local treatment of the sores with x ray, carbon-dioxide snow, or phosphorated oil may be helpful, but is not necessary in conjunction with fuadin and certainly should not replace the latter

It is advisable to cover open sores with protective dressings to prevent autoinoculation and bacterial contamination Once cured, recurrence of any of the leishmaniases is rare

Filariasis

Filariasis is a generic term for a group of diseases produced by a variety of helminths, all of which are transmitted by the bite of mosquitoes There are several genera of "filaria worms" pathogenic for man, namely

1 Wuchereria bancrofti
2 Wuchereria malayi
3 Loa loa
4 Onchocerca volvulus
5 Mansonella ozzardi
6 Acantocheilonema perstans
7 Dracunculus medinensis

Of these only the first two are of importance as far as returning military personnel is concerned and in American military medicine the term "filariasis" has been widely used with reference to infection with either W bancrofti or W malayi The reason for the predominance of Wuchereria infection over the others is the widespread geographic distribution of the Wuchereriae and their ready transmission by a number of mosquitoes of the genera Culex, Anopheles, Aedes, and Mansonioides, while the other "filaria worms" have either a more limited geographic distribution or require a more complicated life cycle than Wuchereria In speaking of filariasis we thus will be referring to a disease caused either by W bancrofti or W malayi

Filariasis is insidious in onset and pursues a protracted course Massive infection with the filaria is necessary to produce demonstrable tissue changes in the body, while symptoms may occur with light infection Early in the disease, i e , several months after the bite of the mosquito patients may show urticaria, fever, and transient lymphangitis The latter is usually located in the lower extremities with W bancrofti infection, while in W malayi infection the lymphatics of the upper extremities are involved These symptoms may last from five to six days to several weeks and recur with frequent relapses In addition there may be lack of energy, general lassitude, fatigue, anorexia, nausea, vomiting, headache, vertigo, blurring of vision, photophobia, and muscle spasm Symptoms of neuropathy and depression are frequent in military personnel

An early physical sign in cases of W bancrofti infection is a unilateral or bilateral funiculitis which may subside after months Lymph nodes in the inguinal canal or in the axilla are often enlarged early

The changes in the circulating blood are characteristic, since about 70 per cent of the patients reveal a marked eosinophilia However, one should not overlook the possibility of other intestinal helminthic infection concomitant with or overshadowing filariasis, since eosinophilia is a common finding in all helminthic infections

Elephantiasis, i e , the permanent, gross enlargement of external genitalia and extremities, has often been referred to and pictured as the most characteristic and specific physical sign of filariasis While this is probably true in natives of endemic areas who are exposed to frequent massive reinfections, it is certainly not so for returning veterans Elephantiasis is the result of repeated infections over a period of many years resulting in definite tissue changes in the affected parts of the body Due to blockage of the lymphatics as a result of destruction of lymph nodes by dead adult worms, lymph stasis will be produced with consequent thickening of the soft subcutaneous tissues This, of course, will become more and more severe and extensive if more lymph nodes are destroyed, but the development of elephantiasis is a matter of many years In natives of endemic areas who are exposed to the bite of the infective mosquitoes from birth on, elephantiasis is rarely seen before the age of 20 years and in general not more than 5 per cent of the population will be affected, thus indicating that it is not a necessary complication of filariasis

Transmission of the disease is due to the bite of an infective mosquito, and a large number of them have been incriminated as actual and potential vectors Culex quinquefasciatus is the most widespread and the most important vector, but other species of Culex and other genera of mosquitoes, as outlined above, have been proved to propagate the infection The complete life cycle of both W bancrofti and W malayi is still somewhat disputed The adult worms live in the lymphatics of man and the females release large numbers of microfilariae into the circulating blood

These microfilariae are then picked up by bloodsucking mosquitoes in whose gut and muscles, after a certain time of in vivo incubation, they develop into infective forms This period may last from ten to twenty days, depending upon the climate and the surroundings as well as other factors guiding the life of the mosquito The infective microfilariae soon migrate into the mouth-parts of the mosquito, only to be deposited onto the skin during a blood meal They then actively penetrate the skin and develop into male and female adult worms It is estimated that at least twelve to eighteen months elapse between the time of infection and the appearance of microfilariae in the blood The actual place of the change of microfilariae into young adult worms is still not known

The diagnosis of filariasis depends, of course, on the demonstration of the microfilariae in the circulating blood, although a symptom complex such as outlined above should make one suspect the disease even in the absence of microfilariae

in the blood It must be remembered that microfilariae will not appear in the circulating blood until about twelve to eighteen months after the infections, i e , long after the symptomatology of early filariasis is well established A curious phenomenon of this disease is the periodic appearance of microfilariae in the circulation between the hours of 10 00 P M and 2 00 A M , although in certain areas of the Southwest Pacific (east of the New Hebrides) nonperiodic forms have been found

It is usually satisfactory to examine a patient's blood by the thick- and thin-film methods as used for the diagnosis of malaria Thick films are, of course, more concentrated and should be used in preference over thin films However, in the early stages of the infection (after at least twelve to eighteen months of incubation) other concentration methods may have to be used to find microfilariae

The adult worms lodge in the lymph nodes and may be seen in biopsies Such adult worms have been found in about 30 per cent of the cases, recently reported from the Pacific Simultaneously the observation was made that removal of lymph nodes or other tissues for microscopic examination at a time when acute symptoms were present, was sometimes followed by severe exacerbations and led to more serious complications Therefore, it is recommended that biopsies should not be performed at such times

Additional laboratory tests are sometimes helpful in the diagnosis of the disease, especially when hemodiagnosis fails Skin tests and complement-fixation reactions have been devised but are not species specific Antigens are usually prepared from a canine filarioidea, namely, the Dirofilaria immitis These tests are reliable only in the hands of skilled and specially trained personnel

Treatment —The treatment of filariasis is so far disappointing, both in the early and in the late stages Brown, in 1944 [6] demonstrated the value of the trivalent antimony preparation, anthiomaline, in selected cases and fuadin is claimed to be of certain value Arsenicals may kill the microfilariae but are not lethal for the adult worms

In elephantiasis, Auchincloss[8] advises a modified Kondolean operation which will reduce the size of the affected extremity temporarily A helpful procedure in the treatment of elephantiasis is the pressure-bandaging technic of Knott.[7] This will definitely reduce the size of those extremities in which the degree of subcutaneous fibrosis is not yet too far advanced

Schistosomiasis

This disease is the result of infection with one of three different blood flukes all of which have a complicated but similar life cycle, but differ in their geographic distribution, their definitive location in the human body, their intermediate hosts, and especially in the morphology of their eggs

The three species of blood flukes are

1 Schistosoma hematobium, which is found especially in North Africa

2 Schistosoma mansoni, found in Africa, South America, and some of the Caribbean islands

3 Schistosoma Japonicum, found in East Asia and some of the islands of Japan, Formosa, and the Philippines, and in the Dutch East Indies

The disease produced by each of these flukes is quite characteristic, once it is fully established, because of the definitive location of the adult worms and the distribution of the lesions caused by the eggs S hematobium is located generally in the venous plexuses of the genitourinary system, while the adults of S mansoni and S japonicum have a predilection for the branches of the superior and inferior mesenteric veins, with S japonicum also favoring the portal circulation Pathologic tissue changes, however, are not produced by the adult worms which live in the vessel lumens, but by the eggs which are deposited by the female in the circulation of the submucosa and mucosa of the bladder in S hematobium infection, in the mucosa and submucosa of the large intestine in S mansoni, and in the liver in S japonica.

The complicated life cycle of the parasites begins with the oviposition of the females within the venules Many eggs are swept into the tissues via the capillaries, where, once arrested, they are the cause of severe tissue damage Others are extruded through submucosa and mucosa into the lumen of the intestine or the bladder from which they are passed with the feces and the urine When these eggs reach water they hatch within a few hours and give rise to first-stage larvae, the so-called miracidia These larvae are equipped with swimmers and actively penetrate definitive species of fresh water snails which act as intermediate hosts Inside these snails they are transformed into second-stage larvae, the so-called sporocysts, which produce second-generation sporocysts the latter giving rise to third-stage larvae, the cercariae These cercariae under certain circumstances, break out of the snail and swim about in the water until they find the definitive host, namely man whose skin they may penetrate within thirty seconds Cercariae must find their definitive host or they will die within sixteen hours Once in the skin they reach blood vessels and after passing through

heart and lungs they reach their definitive destination, where they grow up into adult male and female flukes

The eggs which have not reached the outside world, but have been retained in the tissues, are the cause of the severe tissue changes characteristic of the disease These eggs, acting both by the elaboration of toxic substances and by their mechanical irritation, produce extensive chronic inflammation, in which pseudotubercles, especially around dying or dead and calcified eggs, predominate In the liver extensive hepatitis and cirrhosis is the result of infection with S japonicum The eggs of S mansoni produce severe colitis with thickening of the mucosa, submucosa, and even the entire intestinal wall, often leading to fistula formation or even to widespread intestinal papillomatosis Infection with S hematobium leads to diffuse thickening of the bladder wall and papilloma formation Even carcinoma of the bladder has been said to result from longstanding schistosomiasis hematobia

The early symptomatology of schistosomiasis is vague and not conclusive Allergic reactions, vague aches and pains, slightly raised temperatures, and leukocytosis with marked eosinophilia are the main clinical features Diagnosis, therefore, depends on the demonstration of the eggs in urine or feces and their identification This should be relatively easy, since the eggs of the three species of blood flukes differ considerably from each other The eggs of S hematobium are oval in shape and possess a long terminal spine, those of S mansoni are less elongated and are equipped with a lateral spine, while the eggs of S japonicum are almost round and have only a minute, rudimentary, subterminal spine

The full-blown disease, of course, may simulate any severe liver disease, such as Laennec's cirrhosis in S japonicum infections, chronic ulcerative colitis in S mansoni, and chronic cystitis, urethritis, prostatitis, and vesiculitis in case of S hematobium infection Almost any type of metastatic complication has been observed with all species of schistosoma

Treatment—Treatment is specific and very effective in active infections Chronic infections with severe tissue alterations respond, of course, less favorably Potassium and sodium antimony tartrate have been widely used in the past but fuadin has almost replaced the former, because of their toxic effects on the respiratory epithelium Fuadin is used with good results in the following dosages 1 5 cc of the drug are given intramuscularly on the first day of treatment, 3 5 cc on the third day, and 5 cc on the fifth day The dose of 5 cc is then continued on alternate days, until a total of ten injections have been administered If living eggs are still found in the feces or the urine several weeks after the termination of the treatment, at least five more injections should be given Surgical intervention is indicated only in cases of urethral or intestinal obstruction or in vesicular or intestinal papillomatosis Splenectomy has been performed in cases of schistosomiasis japonica, but the results of this procedure are questionable

Summary

In summary, therefore, the following parasitic diseases are most likely to be encountered in returning military personnel

1 Amebiasis
2 Malaria
3 Leishmaniasis
4 Filariasis
5 Schistosomiasis

Diagnosis is necessary for proper treatment The history of service in tropical countries and careful, accurate laboratory examination are essential to accomplish this end

SOCIAL LION

A reporter was sent to write up the great social event of the year The next day he was called on the carpet by the editor

"What do you mean by saying that among the most beautiful girls present was the eminent surgeon, Dr William Whoozit? Dr Whoozit is not a girl and he is an important stockholder of this paper"

"I can't help that," the reporter insisted doggedly "That's where he was"—*J Am Inst Homeop, Oct, 1945*

A REVIEW OF THE VARIOUS METHODS USED IN THE TREATMENT OF PHLEBOTHROMBOSIS OF THE EXTREMITIES

FREDERIC W BANCROFT, M D , New York City

MY INTEREST in postoperative thrombosis and embolism started actively in 1928. At that time I was dissatisfied with the progress being made to combat these most tragic accidents of surgery and medicine I felt that reports of a series of cases got us nowhere. Therefore, I interested Dr Margaret Stanley-Brown and we started on a five- to ten year study

Our theoretic thesis was as follows We believed that everywhere in medicine there are hyper and hypo conditions. For example, there is hyperthyroidism and hypothyroidism, gastric hyperacidity and gastric hypoacidity, hyperinsulinism and hypoinsulinism, and so on.

We theorized, therefore, that if you would admit that there were potential bleeders, such as hemophiliacs, nutritional bleeders, etc , why should not there be potential intravascular "clotters?" We admitted that hemostasis, hemoconcentration, trauma, and infection were the potential causes of intravascular clotting However, we felt that there must be another factor inherent in the individual which made one patient more susceptible than another

We have seen cases in which all the causes were present and no accident occurred, while others with minimum factors present produced an accident. As an example, we had a patient who sold tickets at a movie booth. She rested her arm on the shelf and developed a thrombosis of the median basilic vein. We therefore theorized that there must be an unknown, X, which was an additional factor in the causes of thrombosis and embolism I should like to review very briefly the theory of blood clotting

The following formula, I believe, is advisable to consider

Blood clotting factors in normal blood prothrombin + platelets + calcium + fibrinogen.

Blood clotting factors in blood preceding thrombosis prothrombin + thrombokinase (from platelet disintegration) + calcium + fibrinogen.

Resulting in blood clotting prothrombin + calcium + thrombokinase = thrombin, fibrinogen + thrombin = fibrin + thrombin.

Of the above elements of blood clotting, prothrombin is decreased in certain bleeding diatheses, the most notable of which is the bleeding diathesis of obstructive jaundice. In our studies it was increased in the patients that developed thrombosis. Thrombokinase unquestionably is produced from platelet disintegration, but this is a difficult problem to evaluate in human patients Calcium is necessary, but in cases of hypocalcemia, there is no bleeding tendency nor is there a tendency for increased thrombosis in patients having a high serum calcium Fibrinogen is increased during infection, and therefore is probably a factor in intravascular clotting Bleeding is not increased when fibrinogen is diminished to a moderate degree. We developed what we called a "clotting index," which consisted of tests for prothrombin and fibrinogen as an evaluation of a patient's bleeding or clotting tendencies.

Before proceeding further with an analysis of our tests, I think it is advisable to define briefly the lesions found in the veins so that we know what we are talking about. Alton Ochsner has given a very good terminology, I believe, which helps us.

1 Thrombophlebitis is characterized by infection, prominent in the vein, accompanied by perivenous lymphangitis.

We all recognize this case clinically, with an elevation of temperature, a red, swollen leg, often with red lines showing the inflamed veins This type is usually recognized early Rest in bed and elevation, as a rule, bring about a cure Embolism is relatively rare from this condition The analysis of embolism from thrombophlebitis at the Mayo Clinic and at the clinic in Toronto shows about 10 per cent of emboli resulting from thrombophlebitis

2 Phlebothrombosis is characterized pathologically by a clot within the lumen of the vessels, gradually extending upward. There is very little perivascular inflammation Temperature is usually only slightly elevated and this condition may not be recognized until a fatal embolism has resulted.

3 Suppurative thrombophlebitis is recognized by marked sepsis and frequent septic emboli Fortunately, this condition is the rarest of the three groups.

During our early study at the Fifth Avenue Hospital, we made routine prothrombin and fibrinogen tests on all patients subjected to surgery These tests were made preoperatively and the fifth and ninth days postoperatively

In our analysis of over 2,000 cases which were routinely studied in patients subjected to

Presented at the meeting of the First District Branch of the Medical Society of the State of New York, October 30, 1945 White Plains.

surgery and also in cases wherein thrombosis or thrombophlebitis had occurred in other hospitals besides our own, we found that, with one exception, these patients were in the so-called "clotting group" with a high prothrombin and fibrinogen index Unfortunately, due to change in the hospital conditions, we had to discontinue this study in 1937

The objection that may be readily entered to our work was that of all routine cases operated upon, 14 per cent showed high clotting factors, while only 2 per cent of these developed accidents In studying the postoperative charts of the patients with high clotting indices, however, we found that these patients ran a slight elevation of temperature for eight to fourteen days postoperatively, in contradistinction to those in the "low clotting index" group, and we felt that while these patients did not show external evidence of thrombosis and embolism, they were in the danger group

Since discontinuing the plasma clotting tests, I have found that there are certain clinical findings which make one suspicious that thrombosis and embolism may occur

In analyzing the cases of the patients who had developed these complications in our own and in other hospitals, we noted that in the abdominal cases most of them had had moderate or prolonged distension and a sense of malaise, and almost universally a longer elevation of temperature than would be expected Since that time, it has been my practice to consider any patient running an elevation of temperature over five days postoperatively which is not attributable to chest, kidney, or wound infection, as a potential thrombosis and to treat him immediately prophylactically, as I shall attempt to describe

Homans has drawn attention to the fact that the greatest danger of thrombosis and embolism lies in the deep veins of the calf, and that if the foot is hyperextended, causing extension of the gastrocnemius, the patient often complains of pain in the calf, whereas lying normally, he is unaware of it Also, I have found by comparing the two calves, with the knees in semiflexion and the patient on his back, that the affected leg gives one an impression of more resistance in compressing with the fingers the gastrocnemius muscle against the posterior surface of the tibia Any swelling of the thigh is more easily detected, as usually the patient complains of some tenderness in the region of Poupart's ligament Careful palpation will reveal a pencil-like cord behind the femoral artery These clinical signs are well worth noting in patients with unexplained temperature

Prophylactic therapy demands First, careful, meticulous handling of tissues at the time of operation, second, the prevention of dehydration, third, the early mobilization of the patient, and fourth, prevention of postoperative distension

All surgeons have encouraged patients to move their extremities early, and recently, getting the patients out of bed on the second or third postoperative day has diminished but not eliminated thrombosis Not a sufficient series has been studied to state how much the percentage has been reduced I have seen 2 patients who were mobilized early develop pulmonary embolism

Postoperative distension may be reduced by early inspection of adhesive-plaster dressings over the abdominal wound On the first postoperative day, these dressings should be inspected and the plaster cut so that the patient can take a deep inspiration and there is no tendency to compress the interabdominal organs It is obvious that if the compression of the abdominal wall by adhesive plaster is severe, it will present intestinal peristalsis, create distension, and second to this, cause compression of the vena cava, allowing venostasis to occur in the extremities It is interesting to note that if adhesive plaster is cut on the side after thirty-six hours, if the patient has to take a deep breath, there is often a spread of an inch or more between the cut ends The patient is much more comfortable with a looser dressing

While I realize that there are many who disagree with me, it is my conviction that, if there is no contraindication, the early giving of food creates a peristaltic wave through the intestines which prevents stagnation with its accompanying fermentation and putrefaction Moreover, I believe that if patients are given food early, they are less likely to swallow air and this helps to diminish distension I also believe that early evacuation with a two-tube colon irrigation aids in the discharge of flatus and in preventing distension

Given a patient that we may suspect may develop thrombosis, what prophylactic measures should we inaugurate? From our experimental studies on dogs, we found that we could diminish the clotting factors by putting them on a low-fat and relatively low-protein diet, and I would suggest that this diet be administered several days preoperatively

In our early experimental work, we went to Dr Charles Loeb, who was professor of pharmacology at Columbia University, and asked him if he knew of a satisfactory anticoagulant that might be given as a therapeutic measure to prevent thrombosis and embolism He stated that he had used sodium thiosulfate in dogs to prevent extra corporeal clotting We didactically started to

use the routine injection of sodium thiosulfate Since that time, considerable experimental work has justified our impression that it had anti coagulant properties The possible rationale for the use of sodium thiosulfate is described by Jorges and Bergstrom, who state that the anticoagulant activities of different heparin preparations obtained in a similar manner from the liver vary in their sulfur contents. Preparations of liver heparin containing from 7 to 12.26 per cent of sulfur show anticoagulant potencies varying from 45 to 160 per cent of the standard heparin from which they are derived Heparin is largely produced by the mast cells in the intima of the blood vessels, and it is possible, therefore, that the sulfur element of sodium thiosulfate may increase the anticoagulant activities of the heparin which is liberated in the blood stream

Therefore, if we suspect that a patient may develop thrombosis, we inject 10 cc of 10 per cent sodium thiosulfate intravenously for three days preoperatively We discontinue the drug immediately postoperatively, and four to five days afterward inject it for several days in succession We delay the immediate postoperative therapy because we have noted cases of bleeding into the wound If there are evidences of old thrombosis of the extremities or varicose veins with recurring phlebitis, it is my custom to ligate the long saphenous vein before attempting the general surgical procedure.

Anticoagulants

I have already described the use of sodium thiosulfate The other two anticoagulants are dicumarol and heparin

Heparin.—If thrombosis has occurred, I do not believe that sodium thiosulfate compares in any way with either heparin or dicumarol. You are all aware of the continuous intravenous therapy with heparin. You know its expense, the difficulties to the patient of having a continuous intravenous solution during several days and the dangers of hypoproteinemia from too much intravenous fluid If heparin is given intravenously, it has to be given continuously because its anticoagulant effects cease within two or three hours after the injection has been discontinued Patients have been seen who have developed thrombosis or embolism following the discontinuance of the use of heparin

Recently a newer method for heparin treatment has been developed by Dr Leo Loewe. I should like to describe his method of using heparin subcutaneously, by injections at two- to three-day intervals I quote from Loewe as follows

"To accomplish a slower and more equitable absorption of heparin, the Pitkin menstruum was adopted as a vehicle This menstruum was developed to regulate the rate of release of water-soluble drugs injected intramuscularly or subcutaneously The ingredients are gelatin, 15 to 30 per cent, dextrose, 5 to 12 per cent, acetic acid, 1 to 1 5 per cent, distilled water, as much as will suffice to make 100 per cent. The viscosity of the menstruum, which is predicated on the concentration of the gelatin and dextrose, determines the rate of liberation of the drug, the greater the viscosity, the slower the liberation In the preparations containing heparin, the optimum percentages of gelatin and dextrose were 18 per cent and 8 per cent, respectively

"Ampules containing varying proportions of heparin and Pitkin menstruum, with or without vasoconstrictor elements, were prepared All ingredients apart from heparin were found to be inactive in control tests

"The contents of the ampules were liquified at 110 F , drawn up through a 2 5-inch 19-gage needle into a previously warmed, sterile 5 cc. or 10 cc syringe and immediately injected subcutaneously, preferably in the anterior or lateral aspect of the thigh. Intragluteal injections were also done in a limited number of instances Although this method of administration was abandoned because of too rapid absorption, further experience may eventually prove it to be just as effective as by the subcutaneous route When two ampules were employed, the contents were thoroughly admixed in the syringe before injecting The material congealed promptly following inoculation The injections were administered with a minimal amount of discomfort to the patient. Some patients subsequently complained of pain, tenderness, and swelling at the site of inoculation, particularly when a large amount (3 to 4 cc.) of the menstruum was used This, however, did not prove to be a deterrent to further treatment, and symptoms promptly subsided upon cessation of therapy"

My observations of Loewe's method show that it does lengthen the bleeding time, and that the patient has no ill effects from the treatment save for the pain in the injection area. This tenderness in the area where the heparin Pitkin solution is injected becomes quite a problem, as the patient may, about the time of the third injection, oppose the injection because of the pain involved As the process is improved, however, I feel certain that this one difficulty will be remedied To those who have had to give heparin constantly for from five to ten days, this method is a great improvement. The expense of the old method, and the amount of fluid given during each twenty-four hours, almost make continuous injection prohibitive in these days of diminishing nursing care.

The results of Loewe's treatment are that it is

possible now to heparinize a patient for ten days at much less expense and with possibly three to four subcutaneous injections during this time

Dicumarol—This is a compound which occurs in spoiled sweet clover silage, and it was discovered in the study of the sweet clover diseases which caused the hemorrhagic diatheses in cattle from the ingestion of spoiled sweet clover hay

Link and his coworkers completed the isolation and synthesis of dicumarol in 1940 Lately it has been used in various clinics as a possible substitute for heparin It has the advantage that it is relatively cheap, that it can be given by mouth, and that it produces a prolongation of the prothrombin and coagulating time Its disadvantages are that it takes from twenty-four to thirty-six hours before it begins to show its anticoagulant effect, and that the action may continue several days after the drug itself has been discontinued Experimental study shows that it causes a widespread dilatation of the superficial vessels but no lesion of the vessel walls, and does not create liver necrosis

Dicumarol is being used more and more extensively by all observers It has disadvantages in that it is hard to control if hemorrhages should occur following its use However, Willard Parsons has recently reported the control of the hemorrhagic tendencies following the use of dicumarol by administration of vitamin K. If this is possible, it makes the drug much safer in our hands Previously, it has been thought that only transfusions would in any way control its hemorrhagic tendencies

Prophylactically, dicumarol is given in many clinics and so far with many promising reports In my own experience, I have never seen a case of thrombosis or embolism occur after the use of intravenous sodium thiosulfate when administered prophylactically I think it is less dangerous and more controllable

Treatment After the Complications Have Occurred

Treatment of Thrombosis—Thrombosis of the long saphenous vein is readily recognized I have given the clinical signs that may make one suspect thrombus of the deep veins of the calf and leg We will assume for the moment that no embolus has occurred and that we have discovered the presence of thrombosis What should be the therapeutic procedure?

Venographs have been advised as an aid to diagnosis by many authors The procedure demands either an excellent portable apparatus or movement of the patient to the x-ray department at a time when you wish to keep the patient quiet It is not always possible to determine whether the filling defect shown in the venograph is due to thrombosis or spasm In the majority of cases, I believe the diagnosis can and should be made clinically

There are three therapeutic measures, namely

1 Proximal ligation and thrombectomy
2 The use of anticoagulants
3 The injection of the first, second, third and fourth lumbar ganglia as described by Leriche and Ochsner

1 *Proximal Ligation*—I mention this first because it seems to me that if an early diagnosis is made, this is the quickest and safest method of preventing pulmonary emboli

If the femoral vein is exposed and no thrombus is discovered, it is a relatively simple matter to ligate the vein between ligatures and excise a piece

Also at this time the long saphenous vein should be exposed to be sure that there is no clot in it If none is evident and there is no evidence of varicosities or superficial phlebitis, it need not be ligated The advantages of this procedure are The patient can be immediately mobilized without fear of developing an embolus and the time and expense of further hospitalization are saved

If a clot is found in the femoral vein, the clot should be sucked out with a sucker until free bleeding occurs It has been my custom to use a female glass catheter which has been sawed off just at the proximal lateral opening and flamed in a Bunsen burner This may be readily passed up the vein for a distance of five or six inches One can observe the clots coming out of the vein and later, free bleeding If free bleeding does not occur, then I have used a rubber catheter, the end of which has been cut off, and I observe again the results of suction through the glass tube The catheter I have often passed up as far as the bifurcation of the vena cava As soon as free bleeding occurs, the vessels are ligated and the wound closed

My experience is not as great as Allen's, but at the present time, I have ligated at least 20 patients above the thrombus I have sucked a thrombus out of the femoral and iliac veins in 14 cases with one mortality due to recurrence of embolism

In 9 of these cases antecedent emboli had occurred, the remainder showing no evidence thereof In three of the cases simultaneous thrombectomy of both the iliac and long saphenous veins on each side with ligation was done, as described below

Of the 14 cases, one was medical, namely, an endocarditis with thrombus of the femoral vein Two were preoperative, one immediately preceding a bilateral oophorectomy for extensive bilateral ovarian carcinoma, and one two weeks

prior to hysterectomy for degenerating fibroids This case (Case 1) is reported in detail later

Eleven cases occurred postoperatively as follows 2 following pregnancy, 1 after cesarean section, 1 after cholecystectomy, 1 after prostatectomy, 1 after amputation of a leg for tumor, 2 after hysterectomy, 1 after recurrent attacks six years following the original thrombophlebitis preceded by herniorrhaphy, 1 after a bumper fracture of the tibia, and 1 after herniorrhaphy

Three of the above group had bilateral thrombectomy performed simultaneously by two surgical teams working at the same time One patient (Case 2) had a thrombectomy on the left side followed two weeks later by thrombectomy on the right side

There were two deaths in this series, one in a patient with bilateral extensive carcinoma of the ovaries wherein the thrombectomy was performed simultaneously with the removal of the tumor This patient died two weeks later of renal insufficiency with no evidence of any return of the original thrombosis

Time is too short to analyze each of the 14 cases in this series in which thrombectomy was performed. The procedure was primarily the same in each and the results in those who convalesced were satisfactory except that one patient has continued to have persistent swelling of the thigh and leg The others have had a fairly rapid return to normal size of the leg and thigh and have complained of no interference with function I should like, however, to describe two patients, since I feel that they present some of the important features concerned with this disease

Case Reports

Case 1 —A woman, aged 46 years, had been seen by a gynecologist who recommended hysterectomy for an extremely tender uterine fibroma which was fixed in the lower portion of the pelvis. The uterus extended midway to the umbilicus. Ten days later, while awaiting operation, acute phlebothrombosis occurred in the left iliac and femoral veins.

I was called to see the patient at this time There was no evidence of pulmonary embolism It was felt, however, that this patient would need hysterectomy in the near future because of a degenerating fibroid, and that it would be advisable to remove the clot from the iliac vein beforehand. The clot was sucked out from the left iliac vein and she was treated postoperatively by subcutaneous injections of heparin. Two weeks later, while still under heparinization a supracervical hysterectomy was performed. The iliac vein was palpated and there was no evidence of any clot in the lumen. There were, however, some old thrombi in the veins of the broad ligament.

This patient's convalescence was uneventful. She left the hospital two weeks after the hysterectomy

Comments

This case was one of the few I have known in which inspection occured within two weeks following a thrombectomy No evidence could be seen by the operating surgeon of occlusion of the vein

Case 2 —This patient had a cesarean section performed for a premature separation of the placenta in a seven-months' pregnancy A live baby resulted, and the postoperative convalescence of the mother was extremely smooth. There was no postoperative elevation of temperature, and no complaint of abdominal or thigh pain. The patient left the hospital on the twelfth postoperative day Three days later she complained of an acute attack of pain in the chest. She was readmitted to the hospital Her temperature rose to 103 F Three days after admission, x ray of the left chest showed irregular consolidation. Her physician had carefully gone over both legs and thighs there was no difference in their circumference by mensuration. There was no tenderness.

Ten days after her admission, the patient had a sudden swelling and pain in the left thigh. I was called to see her on the next day Under local anesthesia the left femoral vein was exposed A clot was removed. I did not feel however, that I had reached the upper end of the clot because free bleeding was not encountered. It was in a strange hospital and there was some difficulty in getting the proper kind of suction consequently I did not insert a catheter high up in the iliac vein as I should have done and I did not get as free bleeding as I wished. Her postoperative condition improved for about six days. Her temperature receded almost to normal, and she had no pain or swelling in the leg. However eight days after thrombectomy, she had a sudden attack of pain in the right side of the chest, with elevation of temperature. X-ray showed a cloudy right lung, with not as great consolidation as on the other side. Up to this time there had been a question whether this was virus pneumonia followed by phlebothrombosis, or whether the initial infarct antedated the appearance of the phlebothrombosis by ten days.

Eight days after the second attack of pain in the chest, phlebothrombosis developed in the right thigh. This time under spinal anesthesia, a clot was removed from the left femoral vein, followed by free bleeding The patient, however began to go into collapse during the administration of the low spinal anesthesia, and her collapse continued after the removal of the clot. She was taken to her room in a serious condition. She died three days thereafter

I quote from the autopsy report

Lungs.—The right lung is completely collapsed and attached to the chest wall by numerous strands of fibrin and purulent exudate. There is about 500 cc. of a fibropurulent fluid in the right pleural cavity The right lung weighs 400 Gm. The left lung is adherent at the apex to the chest wall by

old fibrous adhesions About 100 cc of thick purulent exudate is present in the left pleural cavity The left lower lobe is completely collapsed The left upper lobe is well aerated and pink in color Examination of the branches of the pulmonary artery shows a large thrombus in the lumen of the right vessels with branches running to all of the lobes This thrombus is yellow in color and adherent to the intimal layer of the vessel On the left side, there is a similar-appearing thrombus in the lumen of the branch of the left pulmonary artery leading to the left lower lobe There is no thrombus found in the lumen of the main pulmonary artery No mediastinal node is found

Uterus —The uterus is small and anteflexed The operative wound in the anterior wall of the myometrium is well closed by chromic catgut sutures which are still present Adherent to the anterior surface of the endometrium is some granular pink tissue which grossly resembles placental tissue The tubes and ovaries are essentially normal

The veins in the broad ligament of the right side are natural On the left side, the vessels at the base of the broad ligament contain distinct, well-organized thrombotic tissue The vena cava and both iliac veins are opened The right vein contains some postmortem clot which is lying free in the lumen of the vessel On the left side, however, the blood clot in the iliac vein is well organized, yellowish-pink in color, and adherent to the vessel wall The thrombus runs up into the vena cava for a distance of 3 cm At the upper end of this thrombus the blood clot is distinctly postmortem in nature The branch of the hypogastric vein leading from the left iliac vessel is also thrombosed, as are those of the veins in the pelvis on the left side In the region of the left femoral vein the thrombus in the lumen of the vessels appears relatively fresh but distinctly postmortem in character

Comment

My impression of this case is that, if I had been successful in removing the clot on the left side, there probably would not have been an extension of the process on the right side nor would there have been the later casting off of emboli The unusual picture in this case consists of the time element, that is, the development of the signs in the thigh ten days after the original infarct in each case This was obviously a case which showered emboli from the pelvic veins, as the examination of the uterus showed evidence of broad ligament thrombophlebitis

2 *The Use of Anticoagulants* —Murray, in Toronto, has reported 15 consecutive cases of pulmonary embolism treated by heparin without another embolus The recent literature reports excellent results from the use of dicumarol I have seen emboli after heparinization and feel that proximal ligation or thrombectomy is a much safer procedure

3 *Paravertebral Sympathetic Block* —Leriche first, and later, Alton Ochsner in this country have advocated the paravertebral block of the first to fourth lumbar sympathetic ganglia for thrombosis and thrombophlebitis The rationale for this procedure is that it relieves the venospasm and allows for compensatory venous circulation of the affected limb In many cases the pain is relieved almost instantly In the majority of cases the process rapidly subsides However, most men believe that this is particularly advantageous in thrombophlebitis, but that it does not preclude the danger of embolism in phlebothrombosis and therefore its use is limited mostly to the inflammatory type I have used it as an adjuvant of proximal ligation when there has been continued pain in the extremities This, however, has been limited only to one case

The great value of sympathetic lumbar block is in emboli in the extremities The great difficulty has been when the embolus has been removed from the femoral artery, let us say, that the spasm of the artery was so great that the blood supply was not quickly re-established With lumbar sympathetic block,* this spasm is overcome and there is a greater chance of returning the circulation to the extremities

Sympathetic block and the use of heparin have been two great aids in embolectomy when it is possible to perform the operation early after the embolus has occurred Unfortunately, the surgeon does not see these cases, often, before several hours have elapsed If we are to do successful embolectomies, they should be done within four hours of the time of the arterial occlusion

Summary

Early mobilization, gentle surgery, replacement of fluids, and, if it seems advisable, the use of anticoagulants such as sodium thiosulfate or dicumarol will prevent many of the distressing accidents due to thrombosis and embolism

After the thrombosis has occurred, if one can easily and quickly ligate the vein above the thrombus, this is a simple and safe procedure that does not demand the use of anticoagulants and the patient can be immediately mobilized and his hospital stay shortened When the thrombus has extended above Poupart's ligament, thrombectomy with the use of anticoagulants following this procedure has, in my hands, been very successful This is, of course, a small series of cases, and yet is sufficient to give one a definite impression of the end result I believe that it is safer than the use of anticoagulants alone If the patient is first seen a week or ten days after the thrombus has occurred in the femoral vein, and if no embolus have resulted therefrom, it has seemed advisable to me not to attempt any dis-

turbance of the clot. Emboli, as a rule, occur early in the course of thrombosis, and therefore, if they have not occurred within ten days, the clot is well organized and an accident is not likely to ensue. I have seen only a limited number of these cases, seven in all, but in none of them have any accidents occurred when conservative methods have been utilized

When the thrombus starts in the calf or thigh, the problem is much simpler than in the two cases reported in detail, in which it presumably arose in the pelvic veins of the broad ligaments. In Case 2 emboli were shot before there was any evidence of thrombosis in the extremities In such cases there are two possible operative methods of treatment

1 Inspection of the femoral vein, incision and despite the fact no clot is observed, the passage of a suction tube up to the bifurcation of the vena cava

2 The exposure of the iliac vein or vena cava and ligation proximal to the clot

I do not agree with Allen that all cases need a bilateral ligation. The case reported in detail is the only case I have seen that needed a later ligation of the opposite side

The conclusion that one must make is that one is gunning in the study of thrombosis and embolism for the hundredth case, and one in a hundred saved is worth all the trouble one takes to prevent embolism

16 East 90th Street

VARIED TRAINING COURSES ARE PLANNED FOR MEDICAL OFFICERS

With hostilities ended, medical officers in the armed forces, as well as hospitals and medical schools, have set machinery in motion to repair the holes torn in medical education by the war

In a comprehensive review of specific plans to meet the educational needs of returning medical officers, the September 1 issue of the *Journal of the American Medical Association* says that all veterans regardless of the age at which they entered the service and whether or not they had been in practice are eligible under the G I Bill of Rights for a retraining course of one year at any institution approved by the Veterans Administration.

The *Journal* reports that both the Army and the Navy have already taken steps to provide postwar educational rehabilitation of medical officers.

Even before the defeat of Germany steps were taken by the Army so that officers assigned to field, tactical, and administrative positions would be given an opportunity to get a twelve-week refresher course in one of the large general hospitals in this country

Many officers returning from overseas are now applying for refresher training.

'It is important," the Navy reports in the *Journal* "that intensive training be afforded especially to young officers of the regular Medical Corps, who will become the leaders and 'key men' later in conducting the medical services of naval hospitals in the long postwar period for which provision must definitely be made.'

The Council on Medical Education and Hospitals of the American Medical Association reports that an analysis of questionnaires returned by twenty-one thousand and twenty nine medical officers concerning their postgraduate wishes indicates that approximately 20 per cent of this group will desire short term refresher and review courses of less than six months' duration.

Reports from medical schools hospitals medical societies and other agencies, the *Journal* says, give assurance of continued expansion of educational programs in anticipation of postwar needs.

The University of Wisconsin Medical School has four plans for meeting the desires and needs of physicians returning from military service

A training plan termed flexible enough "so that it can start tomorrow morning or at any time a medical officer returns ' has been adopted by the medical schools of Duke and North Carolina universities the Bowman Gray School of Medicine of Wake Forest College and the cooperating North Carolina hospitals

Three-month full time courses have recently been organized by the medical schools of the universities of Wisconsin Illinois, and Iowa.

The Cook County (Chicago) Graduate School of Medicine has plans to accommodate returning medical officers by offering a large variety of courses at frequent intervals.

The University of Michigan Department of Postgraduate Medicine plans three courses of two months each probably continuing throughout the year 'Such institutions as Tulane, Johns Hopkins, Harvard, Tufts, New York Eye and Ear Infirmary, the New York Medical College, the New York Polyclinic, and the University of Pennsylvania are continuing to offer organized courses," the *Journal* states, adding "These examples emphasize the fact that, even though the staff physicians of all institutions are sorely taxed they have been able to develop or continue opportunities for graduate education.

Fourteen state medical societies have initiated or are planning programs of continuation education for returning physicians.

'It is becoming increasingly important" the *Journal* says, ' that the medical profession and hospitals continue their efforts to maintain and develop adequate facilities and opportunities for the continued training of veteran and civilian physicians." Under peacetime conditions the approved hospitals in the United States provide opportunities for approximately five thousand three hundred resident physicians The *Journal* estimates that hospitals may be called on to furnish a total of about twelve thousand residencies in the immediate postwar period.

GROUP PRACTICE

E C Foster, M D , F A C S , and John A Hatch, M D , Penn Yan, New York

SINCE the time of Hippocrates the medical profession has been one of the most valuable of all the professions of the world Without the art of healing, civilization could not have advanced nor could the other learned professions have progressed satisfactorily Our profession has passed through the mystic stage and the stages of the most learned and experienced individual to one of scientific procedures until, at the present time, no one physician is able to cope with all the necessary procedures required in the art of healing

Today, bureaucracy and politics are threatening our profession, and unless some method is devised by the profession whereby we are organized to give to the public the medical care that is needed, we are doomed to become employees of the State and to be told, without reference to ability, what we can or cannot do It is urgent that we take steps at once to keep our profession, as such, intact

No one will deny that, from the standpoint of curative medicine, it is fundamental that the personal relationship between physician and patient should be preserved On the other hand, it cannot be denied that modern medical science has brought a new concept into the field of medical practice Today we are on the verge of a revolution in this field We know that modern medical practice is a cooperative undertaking It involves a definite understanding between physicians and patients We fully believe that only through concerted, cooperative effort such as is possible and practical in a medical group can we hope to reach our ideal goal, which is the reduction of disease to its minimum, the prolongation of life for all to the full biologic limit, and the very best facilities for competent diagnosis and treatment

It is an axiom of modern industry that waste should be eliminated Industry and commerce are making continual self-appraisals to ascertain whether their methods are inadequate and obsolete, and if so, to find more modern ones We hear of mergers, founded on careful study, which strive for greater efficiency and the saving of waste Medicine, too, applying the same principle, must undertake self-appraisal and study

If such evaluation does not come from the medical profession itself, it is apt to come from the State and Federal government Such appraisals have been made by various governmental agencies and by the medical profession in certain areas It is our belief that group medicine is the answer It has arisen in the medical profession as a result of its own appraisal We believe that group medicine assures the preservation of the professional, ethical, and economic status of the physician We believe, also, on the basis of careful analysis, that group practice is the ideal method of practice for the physician and furnishes the best medical care to everyone at a cost commensurate with the services rendered

We are desirous of focusing the attention of the medical profession on our experience in group medicine In twenty years of private practice and sixteen years of group medicine, we have come to the conclusion that the physician can best do his part to give to his patients the best care available by working with a group Unfortunately, it has been characteristic of the medical profession to be more or less individualist This, no doubt, was sufficient in the early days, but as the years have passed the requirements have become more urgent for specialized work It now becomes evident that we must have some method for facilities and consultation which make it possible to give the public a more adequate service in the diagnosis and treatment of disease than any individual physician can possibly provide

The lay people are becoming constantly aware, through articles written for the lay papers, radio, and magazines, some rightly and some wrongly, as to what is being accomplished in the medical profession They are learning to know whether they are receiving proper treatment When the physician or his family acquires a serious or complicated condition, they usually go to an outstanding medical center where they know they can receive the latest treatment However, most patients are not financially able to do this It is necessary for them to depend on the local facilities available, which they know may not be adequate but which are the best that they can afford in money or time

It is because of this condition that we are interested in helping others to know about the practice of group medicine We think the profession as a whole will agree that there should be some method whereby the rural districts and smaller cities could receive more adequate medical care In presenting the claims of group practice, therefore, we feel that we are performing a duty which we owe to our profession and to our communities

Presented at a meeting of the Seventh District Branch of the Medical Society of the State of New York, held at Clifton Springs, September 27, 1945

As we have mentioned, we consider that group practice is the best answer to this need, and we believe you will be interested to know how a group may be formed, the advantages of a group, and, also, perhaps the disadvantages We have been approached many times by professional men who are interested in group practice, but they have not known what steps to take in organizing their own groups Their chief question is, "How are the physicians in my community going to react toward me?" We wish to emphasize the fact that no one physician should ever attempt to organize a group of doctors by himself It is necessary that at least two or more physicians be interested in the formation of a group before the idea should be attempted Again, you must look to the future and not to the present if a properly functioning group is organized

Financial Organization of a Group

We believe doctors cannot incorporate in New York State, therefore, it must be a partnership or a copartnership All the doctors in a group may be financially interested and, therefore, may share in the profits, or two or more may form the partnership and organize the group and employ other physicians with or without the privilege of becoming partners later An agreement should be entered into giving definite protection to all financially interested partners Such an agreement should include protection against anyone's leaving the group and resuming practice in the same town or city Such an agreement should also cover mutual understanding among the physicians in the group at the time of organization. This is essential because it eliminates cause for misunderstanding in the future

Physical Requirements

We think you will be interested to know the requirements for the formation of a group We will give the most important ones The location should be central, with a driveway to the rear to accommodate an ambulance, and parking space for the doctors' cars The building should be of one or more stories on a separate lot If of new construction, it should be one story if possible If not, the business office and laboratory can be located on the second floor

It should have a large, well-equipped waiting room with comfortable seatings and attractive surroundings At one end should be a receiving secretary s office preferably enclosed in glass with a small teller-type window so that conversation at the window is not audible in the reception room A telephone switchboard should be in this office and each doctor and all offices in the group should have an individual telephone going through this switchboard In this office should be the files containing records of all the patients who come to the group Each individual patient should have his own card on which is listed his card number, name, address, telephone number, etc Adjoining the reception room should be offices on each side of a central hallway leading to the emergency room with an x-ray room adjoining and with an outside entrance for ambulance and accident cases There should also be a well-equipped laboratory and physiotherapy room, including electrocardiograph and metabolism equipment In the rural areas where the physicians are expected to furnish a certain amount of medicines, stocks of the commonly used drugs should be available for each physician. A portable x-ray machine is necessary for patients confined to their own homes If available, dual electrical and heating connections have been found valuable in case of breakdowns

A well-organized library with current journals and reference books is necessary

A business office with modern equipment is essential A room or small apartment is needed for the receiving secretary on night duty

In addition to this, and we consider this important, there should be a smoking room with facilities for making tea, coffee, or light lunches, comfortably equipped, for the female personnel associated with the group There should also be a dining room with kitchenette where the physicians can have their luncheons served

Costs of Physical Requirements —The cost will depend on the size of the building, labor expense, and the type of equipment purchased The best equipment will be the cheapest over a period of years of use In a village of 5,000 to 6,000 this cost will range from about $50,000 to $75,000 A definite plan could be worked out to retire this cost over a period of ten to fifteen years

Personnel

Professional Personnel —The personnel for group practice is necessarily important It should consist of a good internist and he a man of experience. There should be also an experienced surgeon He should have an assistant, a younger man who is a surgeon or at least has had good surgical training One of them should be able to do orthopedic work and another able to do urology There should be a pediatrician who may also handle obstetrics An eye, ear, nose, and throat specialist is very important in the set up In addition to these there should be two or three younger men, according to the size of the community and group, to make calls and assist at operations, one of whom should be trained in giving anesthesia One of the members of the group should be capable of interpreting x rays

and the internist should be capable of interpreting electrocardiograms

Other Personnel—Next to the physicians come the technicians It is important that a group consisting of five or six physicians have one general technician who is able to supervise a laboratory and do x-ray-technician work She should be able to do allergy tests, take metabolism tests, and do electrocardiograms She should have under her a second technician who can do the routine urine examinations, blood counts, and smears, and can assist with the blood chemistries One or two "floating" nurses are essential, according to the size of the group

Office Personnel—A business manager is necessary He should be well acquainted with the people of the community and should supervise effectively the general office work in making out of bills and compensation, welfare, financial, and federal and state tax reports

Three receiving secretaries are needed for day and night service, as someone has to be available for night telephone calls

Two secretaries are needed in the business office, one to keep the books and the other to make out the ever-increasing compensation, welfare, and other reports required by physicians They send out the statements each month

The office personnel should be trained to carry on the work of any member of the business department in case of illness or vacation This relieves the doctors of a great amount of detail and allows them more time to devote to the practice of medicine

Janitor service for the building is necessary

How the Plan Functions

We must not forget that in small communities it will be necessary for most of the group to do general practice This you cannot get away from, and it is very natural because patients coming to a group still want their personal physician and will ask for him If he is not available, they will usually accept another physician This is where the group idea functions well If a surgeon gets a medical case or a medical man gets a surgical case, he has at his fingertips a man for reference who can be brought in at once for consultation The original physician may hold this patient, but he has had advice along the line in which the patient needs treatment In other words, the physician does not lose his individuality in group medicine

Some one or two of the personnel of a group will have the responsibility of making final decisions after consultation as to what will have to be done for the particular patient This is a responsibility which should be given to the older members who have had the greater experience In the group practice of medicine, however, the individual physician should be given freedom to take care of his patients as he sees fit After practicing with a group, the physician soon learns that he has at his command facilities necessary to help him decide proper treatment It is surprising, too, how much the older members of a group can learn from the younger men who have been recently graduated, and the younger men have the advantage of the experience of the men who have had the longer years in the practice of medicine

It is generally true that from 75 to 80 per cent of the patients going to a physician do not require any great amount of special study Therefore, only 15 or 20 per cent really need consultation of any special nature, but these are the patients who require special examination and treatment and require the combined medical personnel and facilities of the group

It is desirable that once a week all of the physicians in the group get together at a luncheon This can be done in the group dining room, if one is available Such a luncheon conference gives an opportunity for discussion of the work being done by the various physicians and any special cases of interest which may be under treatment at that time One of the doctors might be designated to give excerpts from some interesting medical article which might be of value to the rest of the group Once a month there should be a compulsory meeting which all members of the group attend At this meeting reports should be handed each doctor showing the amount of work done the previous month, each individual doctor's business, etc The books of the group should be open for inspection to the partners in the group at any time

In regard to salaries, we have found that doctors should be placed on basic salaries according to their length of service and experience These salaries should be augmented by bonuses according to the amount of business done by the group as a whole, after necessary expenses for running the group are deducted We feel that bonuses should not be based entirely on the amount of business produced by one physician but other conditions should be taken into consideration For example, it is generally conceded that surgeons with relatively higher fees would naturally earn more money for the group than would an obstetrician or an internist, although the latter will spend more time producing the same amount of money We also believe that the younger physician who refers a surgical case and works up that case, making the diagnosis, etc , should be compensated for the actual work and services rendered

In group practice there should always be a doc-

tor left on call These hours should be arranged so that it will not be necessary for all doctors to be on call during the night No one man should be on duty more than one or two nights a week The older men in the group should not be required to have evening office hours The man who is on duty during the evening is the one who will be on call that night for any emergency which may arise

Advantages to the Patient

The patient may select any doctor in the group as his personal physician If his physician finds that the patient is in need of x-ray or special care by another physican in the group, the patient is given this care This gives the patient the advantage of consultation of two or more physicians when needed

If he has traumatic injuries he is x-rayed and if a fracture is found, it is reduced at the group office unless it is of a very serious nature, in which case he is sent to the hospital for treatment

When laboratory work is required the physician can know the results in a short time because of the available equipment Physiotherapy, cardiograms, and metabolism tests are available also when needed.

Portable x-ray and electrocardiograph equipment make it possible to diagnose disease and injuries in the patient's own home Prompt care in emergencies is given day and night In many instances, the patient is relieved of added hospital expense.

A patient who is not acquainted with the group, but happens to come in for an emergency or for some other reason, is frequently surprised to find that his needs can be taken care of without his being sent to a hospital or to a laboratory for tests.

The injured person is quite likely to choose a place where he knows he is going to get prompt attention He usually is not particular which physician takes care of him, but he is desirous of prompt treatment.

Advantages to the Physician

The medical student who has finished his course in medicine and goes to a hospital where he takes his internship soon learns the advantages that are present in that hospital After one to three years of internship he grows more and more to depend on these consultations and facilities When he enters private practice he soon finds that he does not have all of these advantages If he is in a small community, this lack is felt keenly He knows the advantages, but cannot have the needed equipment. Few young medical graduates starting in the practice of medicine can afford to set up by themselves the type of office which will provide the advantages which they had in their hospital training He has had heavy expense to get through medical school and he realizes that he must begin to make a living This is one of the reasons why many men who have taken fellowship courses in some of the larger medical centers today are starting out in twos and threes to locate for their practice of medicine This is especially true with men from the Mayo Clinic and was emphasized to us by one of the young men taking a fellowship there There are, in fact, groups which are doing splendid work today which will not take on a new man who has not had a fellowship at some medical center This is advantageous to the group as well as to the physician starting out on his career

One of the bugbears to a physician if he starts practice alone is the long period which it takes before he becomes self-sustaining This is the downfall of many a potentially good physician

He becomes discouraged With the lack of adequate facilities, it is certainly discouraging to the young man starting to practice Therefore, he is liable to seek some place where his remuneration is sufficient to maintain himself and possibly a family from the time he starts Here is where the advantage of joining a group is outstanding to the physician His valuable services are utilized by the group, and in a very short time he is busy carrying on his profession He is sure of a living, he knows what his income is going to be, he is surrounded by a group of doctors who are interested in his making good, and he is self-sustaining from the time he enters the group It will probably be interesting to know that as far as his actual production on his own initiative is concerned a year or more will be required before he will produce income equivalent to his salary and bonus

He receives many other advantages besides his salary, his bonus, and his associates in the group Let us mention a few

Two to four weeks' vacation with pay

No lost time from sickness or accident, for salary continues

Social security and unemployment insurance

State compensation coverage

Malpractice insurance

County and state medical dues paid

Group life insurance

Hospitalization insurance, etc.

The only thing he is required to furnish in his practice is his transportation

A final advantage is that a physician working alone frequently will have the great responsibility of a very ill patient. In group practice this responsibility is shared by several physicians

The member in the group soon acquires the ability to work with his associates

It is interesting to notice how the younger men, especially those recently joining the group, depend on ideas of the older men in the group They also learn that there are many things in the practice of medicine which they have not learned while in a hospital They learn to meet people readily because they are constantly under the influence of men who have had that experience They learn quickly to handle patients well All of these are advantages to them as physicians

It is our firm belief that younger men, after long years in private practice, may earn a larger income, their net results in terms of personal health and financial gain will be proportionately greater in a group practice

Advantages of the Group to the Public

In all communities it is essential that the public should have access to adequate medical care at all times Just as people often choose their homes and places of business because of the educational and religious facilities, so do many people take into consideration the medical care available for their families in the communities in which they locate

Disadvantages

Many physicians have the misconception that when practicing in a group they are dominated by the heads of the group and have to practice medicine under dictation This would be a disadvantage if a physician were not allowed to practice as he sees fit. This consideration is important in group medicine and has been stated before in this paper There are young physicians who have erroneous ideas concerning their capabilities and think that they are not advancing rapidly enough They may become discontented in a group practice It has been our experience that this type of individual turns to private practice, moves from one place to another attempting to get something better, but is never satisfied There is no place in group medicine for the selfish physician, but there is a place, both professionally and financially, for the cooperative and progressive man

---

WATER SPREADS HEPATITIS

For apparently the first time, medical scientists have experimental evidence that infectious hepatitis spreads through contaminated drinking water This is an inflammatory liver disease sometimes accompanied by jaundice which became widespread among both civilians and military forces during the war

With this medical first comes also the first satisfactory evidence that a virus disease can be naturally acquired by humans through water

Studies showing these facts are reported in the *Journal of the American Medical Association* (Aug 11) by Capt John R Neefe, of the Army Medical Corps, and Dr Joseph Stokes, Jr , of Philadelphia

Gamma globulin from human blood, which is used to give protection against measles, will also protect against this infectious hepatitis, it was found in trials during an epidemic in a heavy bombardment group and various regiments of the ground forces in the Mediterranean Theater last winter These trials are reported in the same issue of the medical journal by Dr Stokes and Capt Sydney S Gellis, Maj George M Brother, Maj William M Hall, Col Hugh K Gilmore and Maj Emil Beyer, of the Army Medical Corps, and Capt. Richard A Morrissey, of the Army Sanitary Corps

Tests of gamma globulin as a protective against infectious hepatitis in the armed forces followed a test of the material by Dr Stokes and Capt Neefe during an outbreak of the disease in a camp for boys and girls last summer The discovery that the virus causing the disease could be spread through contaminated water was made in further studies of this same epidemic The water became contaminated through intestinal wastes from infected persons.

Chlorination of drinking water according to procedures commonly used for rapid disinfection under emergency conditions did not inactivate or weaken the virus, Dr Stokes and Capt Neefe found in studies made with Maj James B Baty, of the Army Sanitary Corps, and Dr John G Reinhold, principal biochemist of the Philadelphia General Hospital

"Superchlorination" of infected water definitely reduced the ability of the virus to cause disease Treatment of contaminated water with sodium carbonate and aluminum sulfate, used to remove extraneous material from drinking water by coagulation, and activated carbon, also used to remove materials from water, did not completely remove or inactivate the virus or germ of infectious hepatitis

Methods used to disinfect water, the scientists report, may have to be modified further in order to inactivate completely the germ that causes infectious hepatitis

Human volunteers had to be used for the studies, since there is no way of knowing whether the virus of the disease is present in a given material except by demonstrating the ability of that material to produce the disease in humans Conscientious objectors and members of the Civilian Public Service Unit 140 of Philadelphia were among those volunteering for the studies Besides drinking suspected and known-to-be-infected water, these volunteers had blood serum, nose and throat washings, and material from body wastes of patients given them, in order to learn how the germ spreads

All the studies were carried out under the direction of the commission on measles and mumps of the Army Epidemiological Board

FUNCTIONS OF A BLOOD BANK

S Miles Bouton, Jr, M D, M S, Rochester, New York
(Pathologist, St. Mary's Hospital)

With the continued growth in importance of hospital medicine as against home care it is becoming increasingly necessary to decide what hospital care should actually include, and to what extent medical house staffs and nursing and laboratory staffs can and should aid the practitioner in his diagnostic and therapeutic program It is an undeniable fact that the practice of medicine is being encumbered more and more with formidable technicalities involving specialized knowledge entirely separate from diagnostic and surgical ability, and intramural hospital medicine is evidently developing more and more as a highly complex field apart from extramural practice As a result the busy practitioner can less and less retain actual first-hand responsibility for a hospitalized patient's welfare over a full twenty-four-hour period, when the former is able to spend only one or two hours at that hospital during that period

The present relationship of practitioner to intern in the average general hospital is inadequate to bridge the gap, as the latter should not and cannot function other than as an instrument for carrying out the personal therapeutic plans of the former unless he may, in order to feel justified and safe in modifying such plans or acting on his own responsibility, fall back on some adequately authoritative and responsible individual in the institution, in order best to serve both the extramural doctor and his patients

A review of the development of parenteral therapy during the past years will serve to recall the initial scant variety and small quantities of fluids used intravenously—a range well within the scope of the technical and scientific understanding of the modern practicing physician—and the tremendous increase in quantities given, indications for use, variety and complexity of substances infused, as well as in equipment and manner of administration There has been a corresponding inevitable growth in number and importance of contraindications

There has, however, been no corresponding improvement in control or reorganization of the agencies concerned with such therapy, so that there now exists the anomalous situation of this whole complex and potentially most dangerous field of therapy being broken up among resident and intern staffs, laboratory technicians, nurses, supply room, pharmacy, and so-called blood bank. The practitioner, meanwhile, remains the only actually responsible medical man concerned, completely overwhelmed and outdistanced by developments not strictly within the field of medical practice, with which he cannot possibly maintain full contact because he has neither the temperament nor the time, and over which he can exercise only the most incomplete control.

The reference to "blood bank" in this connection calls for definition of the term There are at present in the city of Rochester, for example, four so-called blood banks (five, if we include the now defunct Red Cross blood bank), with another in the making, and literally no two of these are alike The term is applied so loosely that it is used to denote any storage arrangement at all within a hospital whereby either some blood or some plasma in some form is available without having to call in a donor at the actual time of use The usual conception at most includes the bleeding of replacement donors and the pooling of plasma, but not the actual typing and cross-matching, which are usually done by the separately functioning clinical laboratory, or the transfusing itself, which is usually in the hands of various interns and residents The so-called management of such so-called blood banks is usually in the hands of a more or less nonexistent "committee" composed of, strictly speaking, unqualified physicians, and the responsibilities involved are divided up to such a ridiculous extent that a mass of paper work is required as a means of safeguarding against errors.

This machinery, acting more or less automatically, is, moreover, ordinarily set in motion solely and unmodifiably, with practically no recourse to appeal, by a surgeon who specifies type of fluid, time and quantities of administration, and who may then be unavailable (for the greater part of the day (or even more than a day) after a brief review of the patient's condition at the time of ward rounds or of completion of the operation

If transfusion reactions of any kind occur, any one of a number of individuals and of factors may be responsible The means of tracing down the trouble are complicated and often result in guesswork and mutual recrimination because of this division of responsibilities Reactions may be due to dirty or old tubing, dirty glassware, bacterial contamination anywhere down the line of procedures, improper typing, improper cross-matching, administration of the right

Presented in part, before the New York State Association of Public Health Laboratories at Albany November 2 1945.

the wrong patient or of the wrong blood to the right patient, or the presence of unexpected allergen in either patient or donor When, however, all these factors have been controlled as well as they should be in present-day medical practice, there remain as the two recognizedly largest groups of reactions those due to too much fluid given too rapidly, and those due to the patient's own condition, that is to say, marked sepsis, profound anemia, cachexia, intrathoracic tumors, pulmonary edema, cardiac failure, etc , some of these manifested in part by the presence of autoagglutinins

These last-named groups form the often so-called "irreducible minimum" of reactions The term is absurd, as I am proving in my home territory With undivided responsibility for all blood bank functions vested in a qualified and more or less constantly available physician, with all procedures in the hands of the same specially trained workers, and above all, with authority to cancel temporarily or modify the practicing physician's orders in the event of the latter's unavailability, the reaction rate of infusion therapy drops sharply

For some years past I have maintained that there should be a close relationship between hospital pathologist and blood bank, involving direct or delegated, but in any event undivided, control and responsibility It is no longer novel to state that the hospital pathologist functions best when he is concerned at least as much with the living as with the dead, and that the study of tissue changes without a deep insight into chemical and related processes in the living organism represents a very inadequate service to hospital practice If this is granted, then the whole field of so-called fluid balance must be included

This presupposes, of course, that the pathologist is willing to assume such responsibilities so as to serve his hospital to the fullest extent of his specific training and knowledge

The foregoing is, furthermore, based on the premise that infusion therapy generally can in some way be centrally and medically controlled That this is so, I have for the past three years been in the process of proving, through the development of what is considered at our institution a unique type of blood bank This blood bank carries through all procedures from selection and bleeding of donors by appointment to administering the transfusions and checking on the patient's condition previous to and following the transfusion This includes examining the patient's chart as to diagnosis, previous intravenous fluid administration, and condition at the time, with postponement of transfusion and report to me in the event of possible danger Experience has shown that graduate nurses, trained by me initially and repeatedly in both the theory and practice of cross-matching, grouping, and all related procedures are best suited for this work By virtue of their initial nurses' training (in part, perhaps, also by virtue of their uniforms) their relations with the lay public are unquestionably better than those of laboratory technicians I meet regularly with the blood bank staff for discussion of latest developments, and the bank reprint library is kept up to date in everything relating to blood and blood products We have, for example, spent much time in the last few years on the Rh problem and now represent a sort of consulting bureau for the hospital staff

As a quasi-independent organization, we have been free to change methods, to experiment, and to introduce pioneering regulations involving even prices, as, for example, in the field of initial Rh typing of pregnant women free of charge, and, through arrangement with Dr Diamond's Blood Grouping Laboratory in Boston, Rh subtyping, examination for anti-Hr antibodies, and determination of possible heterozygote character of the husbands as the basis for advice to such individuals by their physicians

The blood bank has, for over a year and a half, been preparing and infusing red-cell resuspensions in steadily increasing amounts, coincident with education of the medical staff as to indications, it has for a long time been preparing and therapeutically administering red-cell paste in various forms, as well as powdered dry red cells, so far free of charge, while attempting to evaluate indications and results, and, throughout the past year, A and B substances have been use with O blood in many cases The latter sub stances are supplied for experimental use by leading pharmaceutical house ACD solutio is used to preserve rare bloods, such as Rh negatives, for more than the usual storage perio

As a result of the bank's control over choice o infusion fluid, we are able to maintain a constar adequate reserve of liquid plasma and, purchase with the income on nonreplaced compensatio transfusions, a larger rock-bottom reserve o commercial dry plasma for use in mass emer gencies or for special purposes It will be note that we are especially interested in better utiliza tion of side products, as a prerequisite for an logical means of adjustment of prices, some o which are, under present-day streamlined pro cedures, unjustifiably high

In addition to the individuals regularly i charge of the bank, all student nurses rotat through the blood bank for some training, aime chiefly at impressing them with the dangers in volved and enabling them to take over at th bedside after transfusions have been started, s that many transfusions may be given simul

taneously throughout the hospital The trend of developments in this field has been such, however, that it is pointless for an individual responsible for all blood-bank procedures to sit for one, two, or more hours with one patient when no one else can take her place in her other capacities This is so because today the various steps—from the first preparation of the blood donor to the moment of introduction of the transfusion needle into the patient's vein—in their present refinement represent so many checks on the safety of the final procedure of infusion that, on a purely mathematical basis, the likelihood of serious difficulty during infusion is reduced to a minimum, especially as the last precautionary step even includes a consideration by the blood bank staff of the patient's general condition in regard to tolerance of infusion of liquids It would, therefore, appear logical to be able to delegate responsibility from this point on The need here is for a watcher who has been trained to look for certain obvious signs, to stop the infusion if these signs are alarming (a simple procedure in itself), and to call for proper assistance, for which there is usually ample time.

The endless struggle to eliminate "pyrogens" has brought about the development of various modifications in the ritual of washing rubber and glass tubing used repeatedly in infusions, and substitute materials have been promoted on the market to replace rubber The most promising of these is "viscose" tubing, which is discarded after only one-time use It is quite inexpensive, even considering the quantities required, but its apparent advantages are counterbalanced sufficiently by inherent drawbacks to render its use at least debatable Personal communication to the writer from an American hematologic authority has discouraged its use here so far, but improvements in this field are being closely followed * The best solution of the problem to date here has been the introduction, some months ago, of the routine use of a wetting agent in the blood-bank cleaning procedures, and so far the results are highly satisfactory

The factor of overloading of patients with fluid stresses the need for control under one head of all hospital infusion therapy, including that of saline, glucose, amino acids, anticoagulants, penicillin, etc , as any separation means that an agency such as our present blood bank cannot so readily be aware of the amounts of fluid other than blood products with which a given patient is being flooded

I believe that it has been demonstrated to our medical staff at this hospital that the line of separation between the blood bank on the one hand and the utilization of glucose, saline, amino acids, etc., on the other is highly artificial and arbitrary at this time, and that the logical next step is the centralizing of all infusion therapy into one department to serve both physician and patient better, more uniformly, and more economically, and thus to justify more thoroughly the fact of hospitalization It is stressed that this development is not intended as a means of depriving the practicing physician of authority or prestige, but is, on the contrary, intended to assist, consult, and protect the physician through the agency of a constantly available service, and thus to lighten his burden by functioning as his delegate in his absence

I firmly believe that the hospital pathologist, as consultant and as link between science and medical practice, is to some extent under moral obligation to be a motivating factor in these developments and reforms If the objection is one of lack of time from other duties, he should still take or retain the lead by delegating this work to a qualified assistant directly responsible to him There is here, it seems to me, a possible field for young physicians returning from the armed forces and anxious to do intramural hospital work before going into civilian practice.

Summary

Attention is called to the growing complexity of the practice of medicine in hospitals, especially in the field of intravenous fluid therapy The inherent drawbacks of present-day blood bank and supply room organization are described, and the procedures outlined for centralization of all blood, blood-product, and other infusion therapy

The need is stressed for the vesting of over all authority and responsibility in one individual, who should be more or less constantly available within the hospital, and the role of the pathologist in this type of organization is defined

It is suggested that this represents a field for young physicians returning from the armed services in search of assistantships, fellowships, and residencies in hospitals

* The bank is experimentally changing to the use of disposable viscose tubing in the actual transfusion process, but is for the time being continuing with the use of rubber tubing in the bleeding of donors and pooling of plasma. We are contemplating a change to disposable rubber tubing for these steps.

ARTIFICIAL PNEUMOPERITONEUM BY CUL-DE-SAC PUNCTURE

A New Technic for Pelvic Pneumograms

ALBERT DECKER, M D , New York City

PUNCTURE of the abdominal wall and the introduction of air, carbon dioxide, or oxygen under pressure into the abdominal cavity has been used for many years as an aid in the diagnosis of intra-abdominal disease The procedure has also been used as a therapeutic measure in abdominal as well as thoracic lesions Transabdominal pneumoperitoneum was first introduced by Kelling in 1902 as an aid in visualizing the abdominal viscera by endoscopy Ruddock popularized this procedure and established the value and safety of peritoneoscopy Pneumoperitoneum as an aid in roentgenologic examinations was perfected by Stein and Stewart[1] twenty-five years ago and was hailed by some as a milestone in the progress of x-ray diagnosis The method has never been used extensively for several reasons The development of the contrast media which give excellent results in kidney and gallbladder study has made pneumograms unnecessary in these cases These media are safe and at most require no other procedure than phlebotomy Abdominal puncture when the cavity is not distended with fluid is eschewed by the nonsurgical technicians There have been deaths reported from embolism, hemorrhage, and infection following abdominal puncture and the introduction of air under pressure Fatal accidents have also occurred after intravenous use of contrast media

The antipathy of the roentgenologist and the psychic aversion of the patient to abdominal puncture have largely relegated this procedure to selected cases of obscure abdominal or retroperitoneal conditions that were not elucidated by other methods

Clear and striking demonstrations of adhesions between the intestines and abdominal wall by means of pneumograms have been reported Martin,[2] Orndorff,[3] and Sante[4] reported a large experience with pneumoperitoneum in the diagnosis of upper abdominal conditions such as cirrhosis of the liver, intestinal adhesions, and generalized abdominal carcinoma Martin states that it is useful in the study of tumors in the left upper quadrant Sante reports one thousand introductions of transabdominal pneumoperitoneum made without any untoward results The substitution of carbon dioxide for air has added to the safety of the procedure

Recent and ardent advocates of pneumoperitoneum in x-ray diagnosis have been in the field of gynecology Stein has a large experience with pneumograms in gynecologic diagnosis He concludes that pneumograms are more valuable and more informative and less harmful in some cases than hysterosalpingography Transabdominal pneumoperitoneum and hysterosalpingography were combined in selected cases with excellent results Stein[5] reports a case of unruptured ectopic pregnancy diagnosed by a pelvic pneumogram

Artificial pneumoperitoneum with carbon dioxide is a safe procedure No case of embolism has been reported when carbon dioxide was substituted for air The gas is absorbed in a few hours so that the unpleasant symptoms caused by pneumoperitoneum are avoided Air is absorbed from the abdomen slowly and large amounts have caused symptoms for eight to ten days The quick absorption of carbon dioxide makes it first choice in pneumoperitoneum Moore[6] injected air into the pulmonary vein of test animals with immediate fatal results When carbon dioxide was substituted for air, no untoward results occurred

Hysterosalpingography with pneumoperitoneum often discloses diagnostic information not obtainable by bimanual examination or other diagnostic procedures

The transuterine method for producing pneumoperitoneum is the first choice It is carried out exactly as a Rubin test The Rubin siphon meter is used so that a measured amount, 1,000 to 1,500 cc , of carbon dioxide is injected If hysterosalpingograms are desired, the lipiodol is injected after the carbon dioxide Frequently when pneumograms are desired, it is found that the fallopian tubes are closed so that gas cannot be injected through them into the peritoneal cavity In that event, the transabdominal route has been the second method of choice.

Experience with the production of pneumoperitoneum in conjunction with culdoscopy[7] has suggested a new, safe, and simple technic for the introduction of air or carbon dioxide into the peritoneal cavity

This method utilizes the negative pressure created in the abdomen by the knee-chest position The intra-abdominal negative pressure created by the knee-chest position attains 12 to 15 cc of water as measured by the Zavod pneumo apparatus When the cul-de-sac is punctured in the knee-chest position, an immediate spontaneous pneumoperitoneum of 1,500 to 1,800 cc results

Technic

The patient is placed in the knee-chest position. The perineum is elevated with a Sims speculum and the vagina is painted with a nonirritating antiseptic solution A short, beveled, 4 1/2-inch needle, gage 20, is attached to a 2 cc syringe The cervix is grasped with a tenaculum and pulled downward The needle is pressed against the posterior vaginal wall at a point just above the cervix The needle point is directed toward the center of the pelvis and pushed through the vaginal vault into the cul-de-sac. When the plunger of the syringe is removed, an immediate and spontaneous pneumoperitoneum results The inrush of air can be attested by the sound created in the syringe by alternately opening and closing the aperture with the thumb When it is desired to substitute carbon dioxide for air a special cannula can be used, as shown in Fig 1, or the 4 1/2-inch needle may be used and attached to the Zovod

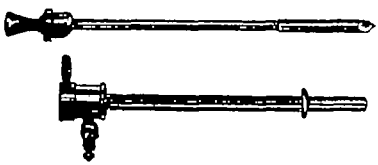

FIG. 1A. Trocar with grooved surface. B Cannula with lock and valve. When used to puncture the posterior vaginal wall in knee-chest posture the spontaneous pneumoperitoneum is controlled and measured amounts of carbon dioxide are introduced through the valve.

pneumo apparatus before introduction. Carbon di oxide has the advantage of quick absorption When the pneumograms are to be taken several hours after the introduction of the gas it is advisable to use air to insure continuation of the pneumoperitoneum.

Cul-de-sac puncture in the knee-chest position as a method of producing pneumoperitoneum has many advantages over the transabdominal route Like abdominal puncture, it is available when the transuterine channel is blocked The advantages may be enumerated as follows

1 The psychic aversion to abdominal puncture is avoided.

2. The air is not introduced under pressure, so that the danger of air embolism is avoided.

3 The pelvis is notoriously less readily infected than the abdomen. Posterior colpotomy is conceded to be a safe approach to the pelvis.

4. Very little apparatus is needed for cul-de-sac puncture and no local anesthesia is required.

5 There is less danger of injury to intestines as the position removes them from the pelvis.

6 When the special cannula is used for the production of transvaginal pneumoperitoneum the pelvis is available for endoscopic examination (culdoscopy) This procedure in the opinion of the author, is a distinct aid in the diagnosis of obscure pelvic disease.

This method is not available when the cul-de-sac is filled with adherent viscera or tumors, or when there is atresia of the vagina.

In the occasional case, the intra-abdominal negative pressure can be utilized in the transuterine method. When the tubes are patent and not spastic, an intrauterine cannula inserted into the cervix while the patient is in knee-chest position results in a spontaneous pneumoperitoneum of a volume sufficient to produce pneumograms.

The following is a brief history and report of the physical findings in a case in which pelvic pneumograms were taken. This case is presented to show the ease with which air can be introduced into the pelvis even in the presence of a large mass. The x ray pictures taken before and after the introduction of the air illustrates the value of intra-abdominal air in accentuating the shadows of abdominal and pelvic tumors.

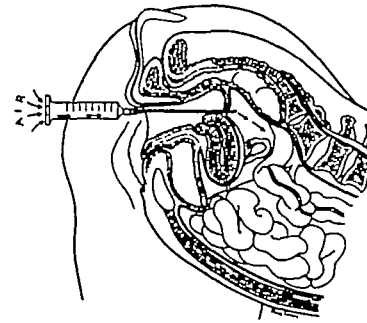

FIG 2. Cul-de-sac puncture in the knee-chest position. The needle is shown passing through the posterior vaginal wall into the cul-de-sac. When the plunger is removed spontaneous pneumoperitoneum occurs

Case Report

M L., aged 23 white, was admitted to Knickerbocker Hospital on November 16, 1944 Her chief complaint was of abdominal cramps and swelling of the abdomen for the past four months. Her previous history included pneumonia at age 7, and bartholinian abscess two years ago

Menstrual history was as follows onset at 12 regular every twenty-eight days, duration four days, pain and clots with periods for past three years the last menstrual period began November 8, 1944 No menstrual irregularity was reported. The patient noticed a small swelling in the midline of the abdomen in December, 1943 Since then, the swelling had become larger and painful. The swelling had been rapid during the four months before examination.

The bowels were regular, and there were no urinary symptoms. Abdominal examination showed the abdomen to be adipose. There was a palpable mass in the lower abdomen that extended to within 3 cm. of the umbilicus. The mass was smooth round mobile and not tender The cervix was firm anterior, closed, and freely movable without pain.

The uterus was believed to be deviated to the left and normal in size, but it was not clearly defined by bimanual examination. The left ovary was palpably enlarged and not tender A cystic mass occupied the pelvis above the uterus and extended into the lower abdomen. The mass was not fixed and not tender The cul-de-sac was free.

The differential diagnosis was between ovarian cystoma, fibromyoma, uterine pregnancy and hydrosalpinx. The Aschcim Zondek test was negative. Blood count and urinalysis were normal Pneumograms were taken after cul-de-sac puncture in knee-chest posture.

Fig. 3 shows the x-ray taken before and Fig. 4 the x ray taken after production of pneumoperitoneum The diagnosis of hydrosalpinx was suggested by the x ray This is an excellent demonstration of the

FIG 3 Pneumoperitoneum following cul-de-sac puncture in knee-chest position X-ray of abdomen in upright position reveals the amount of air that enters the abdomen by this procedure

FIG 4. Pneumoperitoneum (air) forty-eight hours after cul-de-sac puncture This finding demonstrates the slow rate of absorption of air from the peritoneal cavity

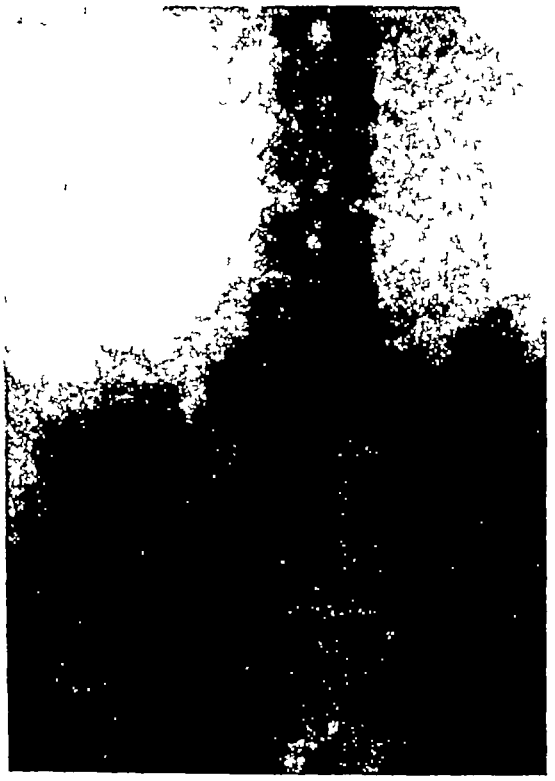

FIG 5 Patient M L Preliminary x-ray of abdomen taken before cul-de-sac puncture

FIG 6 Patient M L X-ray of abdomen after production of pneumoperitoneum by cul-de-sac puncture and intrauterine injection of lipiodol The cystic tumor is plainly visualized by this method

accentuation of the pelvic shadows by the presence of intra-abdominal air The cul-de-sac puncture in this instance was made with a special trocar and cannula, the culdoscope was introduced and the pelvic contents were viewed The uterus was observed and found normal. The ovaries were enlarged to a diameter of 5 cm., they were pale in color, not cystic, and free from adhesions. The large cystic mass was defined as occupying the distal two-thirds of the left tube. The right fallopian tube was normal. These findings were confirmed at operation.

Conclusion

Artificial pneumoperitoneum with air or carbon dioxide is a valuable adjunct to the x-ray diagnosis of pelvic disease.

A simple technic for a quick, painless and safe method has been described.

When a special cannula is used culdoscopic examination of the pelvis may also be carried out.

10 West 74th Street

THE RADIOLOGIC DIAGNOSIS OF ECTOPIC PREGNANCY

RICHARD H MARSHAK M A , M D , New York City

UTEROSALPINGOGRAPHY to visualize tubal pregnancy has rarely been performed in this country Case reports have appeared recently in the South American literature illustrating the successful application of this procedure. A. de Moreas used hysterosalpingography in 2 cases of ectopic pregnancy for diagnostic purposes.[1] In one case the x ray picture clearly showed the ovum in the lumen of the tube. The purpose of this paper is to present a case report of a patient on whom uterosalpingography was performed to determine the cause of uterine bleeding and an ectopic gestation was accidentally visualized. The possible advantages of this procedure will be discussed.

Case Report

The patient was first seen in October 1944 with the chief complaint of vaginal bleeding of two weeks' duration. The family history and the past history were essentially negative. Her periods had started at the age of 13, occurring every twenty-eight days Bleeding usually lasted four to five days, was not profuse, and there was no accompanying dysmenorrhea. Her last period was September 15 1944, at which time she had a period which lasted only three days. The flow, however, was no different than during previous periods. On October 1 she began to bleed and continued bleeding lightly for two weeks, the bleeding was unaccompanied by abdominal cramps. This was the first time that the patient had ever had any intermenstrual bleeding Physical examination revealed a fairly well-developed and well-nourished woman aged 22. Examination was entirely negative except for the pelvic findings which were as follows the cervix was somewhat soft, the uterus was not enlarged and was in midposition. Neither adnexa could be palpated but slight tenderness was elicited in the left adnexal region. A pregnancy test (Friedman) was performed which was reported as negative. The patient was admitted to the hospital where a curettage revealed proliferative endometrium. The patient continued to bleed vaginally following the curettage and a hysterogram was performed to further investigate the cause of the bleeding This procedure was done since it has been our experience that occasionally a small endometrial polyp or even a submucous fibroid can be mixed with a thorough curettage and be visualized on the hysterogram Two films were taken, one with 2 cc. of viscorayopaque and the next with 4 cc The x-rays revealed the uterine cavity to be normal in size and shape, the right tube revealed no evidence of any abnormality *and was patent, but the left tube revealed a circular* filling defect about 1½ cm in diameter about its center (Figs. 1 and 2) There were no ill effects from the hysterogram. A diagnosis of left tubal pregnancy was made and the patient was explored. A tubal pregnancy was found at the site of the circular filling defect described above (Fig 1) A small localized hematocele was present in the cul-de-sac. The patient made an uneventful recovery and was discharged on the tenth postoperative day

Comment

Although an ectopic pregnancy was suspected in this case the laboratory findings were so completely negative that laparotomy was postponed. The finding of proliferative endometrium with an ectopic gestation is not too uncommon and has been reported many times.[2] It is not the purpose of this report to discuss the negative Friedman test. The hysterogram, therefore, was not done to visualize *the ectopic pregnancy, but, as has been stated previously,* to further elucidate the cause of the bleeding.

The filling defect in the tube corresponded exactly to the site of the ovum The question now arises if

Medical News

Lt Col Craighill Is Named Consultant for the Medical Care of Women Veterans

THE appointment of Lt Col Margaret D Craighill as consultant for the medical care of women veterans, the first position of its kind in the Veterans Administration, was announced on January 2 by General Omar N Bradley, administrator

Formerly consultant for women's health and welfare to the Surgeon General of the Army, Colonel Craighill in her new post will serve with eleven other specialists previously appointed as consultants in medicine and surgery for veterans' hospitals under Brig Gen Elliott C Cutler

A specialist in surgery and gynecology, Colonel Craighill before joining the Army was Dean of the Women's Medical College of Pennsylvania, in Philadelphia, the only medical college for women in the United States, from which she is on leave

American Social Hygiene Association to Meet in New York

THE annual meeting of the American Social Hygiene Association and the annual regional Social Hygiene Day conference will be held in the Hotel Pennsylvania, New York City, on February 6 The program includes papers on "What the War Has Taught of Use to the Future Social Hygiene Program" and "The Future of Social Hygiene in the United States" The speakers will be Drs John H Stokes, of the University of Pennsylvania, and J Cavillon, Ministry of Health of France Presentation of the William Freeman Snow Medal will be made at this meeting

Dr Brooks Retires from State Service

DR PAUL B BROOKS, deputy state commissioner of health, retired January 1 after thirty years' service on the staff of the State Department of Health

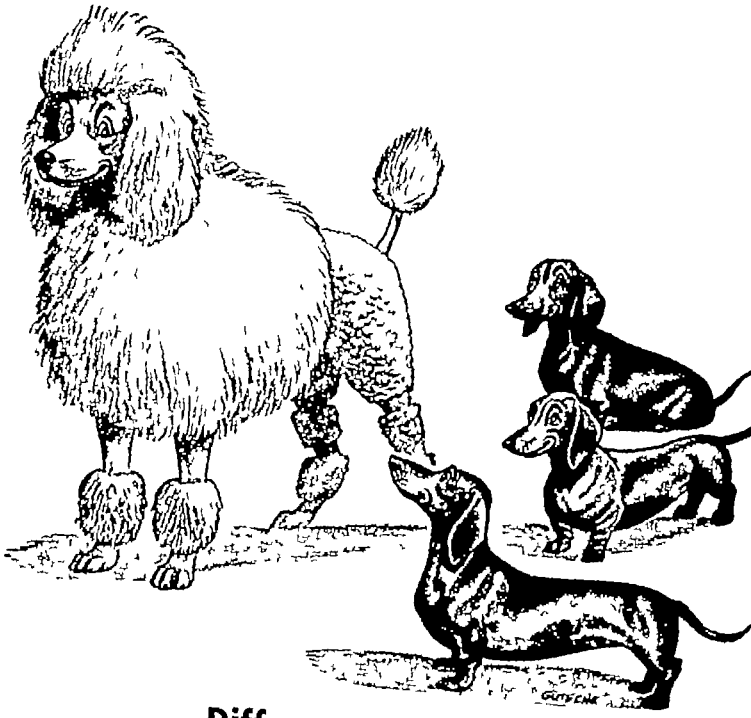
Dr Brooks has been deputy under three commissioners, the late Dr Matthias Nicoll, Jr, Dr Thomas Parran, and Dr Edward S Godfrey, Jr His administration has been distinctive as an expression of broad understanding of public-health practice and an almost intuitive grasp of the problems and viewpoint of the medical practitioner

His insight into practical medicine may be ascribed partly to family background and partly to his own boot-training and experience in the medical profession The son of a physician with an extensive practice, Dr Brooks attended University and Bellevue Hospital Medical College, now New York University College of Medicine, from which he was graduated in 1903 He served two years as an intern on the Third Division of Bellevue Hospital

After two years as a junior assistant physician at Buffalo State Hospital, Dr Brooks practiced medicine for about seven years in his native Norwich He was town and village health officer for a time and later, when Norwich received a city charter, became a member of the city Board of Health

He was made acting director of the Division of Communicable Diseases in 1917 and two years later was appointed to the position of assistant director of the Division of Laboratories and Research, which he held until 1923, when he was named deputy commissioner by Dr Matthias Nicoll, Jr, who was then commissioner During the past twenty-two years, Dr Brooks has played a prominent part in the development of department activities He is best known perhaps for his contributions in the field of milk sanitation and for his characterization of "Dr Jones," a stellar role in "The Health Hunters" plays, since the inception of the series twelve years ago as the Department's weekly radio program He is the author of the "'Dr Jones' Says—" column which has appeared in *Health News* since 1937 and which has been widely read and quoted

Retirement of Dr Conway



DR JOHN A. CONWAY, dean of district state health officers, retired January 1, 1946 after thirty-one years' service in the State Department of Health

Dr Conway was one of the first six physicians appointed on the department staff in 1914 under the title of "district sanitary supervisor," a position corresponding to the present "district state health officer" He is the only one of the original appointees who has served continuously in the same position to the present time For many years he has served the counties of Allegany, Chemung, and Steuben from headquarters in Hornell

After receiving the degree of M D from the University of Buffalo in 1903, Dr Conway interned at Sisters Hospital, Buffalo, and later established himself in general practice in Hornell He became interested in public health early in his professional career and acquired his first experience in that field in the capacity of health officer He served the towns of Greenwood, Troupsburg, and West Union, and the city of Hornell, all in Steuben County, at intervals from 1907 to 1917 His interest in public-health practice extended beyond the confines of his immediate jurisdiction and in the summer of 1912 he went abroad to study the organization and work of smaller departments of health in England, Scotland, and in continental Europe During World War I, he served as epidemiologist with the rank of captain at Camp Humphries, Virginia In the course of his administration of the duties of district state health officer, Dr Conway made a number of epidemiologic studies, including the investigation of an outbreak of typhoid fever which he traced to the consumption of stored natural ice which had been harvested from a heavily polluted source

He is a past chairman of the Public Health Section of the Medical Society of the State of New York and a former president of the Steuben County Medical Society

Different in form

Honey-like liquid form and strictly professional promotion are two unique advantages of Maltine with Vitamin Concentrates. These features afford the physician better prescription control. Moreover, patients are pleased with the pleasant citrus flavor, the effectiveness, and the economy of this balanced multiple vitamin preparation. Each fluid ounce contains:

Vitamin A	10 000 U.S.P. Units
Vitamin D	1000 U.S.P. Units
Vitamin B_1	3 Mg. Thiamine Hydrochloride
Vitamin B_2	4 Mg. Riboflavin
Nicotinamide	40 Mg.
Pantothenic Acid	350 Micrograms
Dicalcium Phosphate	17 Grains
Maltine	q. s.

Dosage: Two teaspoonfuls twice a day. Available through prescription pharmacies in bottles of 12 fluid ounces. The Maltine Company, New York. Established 1875.

Maltine with Vitamin Concentrates

County News

Albany County

Dr John B Averill, of Albany, has taken over the practice of the late Dr Walter K Grigg, who died in Albany December 8

Dr Averill was honorably discharged from service in November after his assignment to the 4th Armored Division

He is a graduate of Columbia University's College of Physicians and Surgeons *

• • •

Having received his discharge in December, Dr Douglas L Root will resume his medical practice in Albany

He held the rank of major with the American Air Force and served three and a half years in Africa, Sicily, and the European theater *

• • •

Lt Comdr Charles Ethan Allen, former Albany physician, has been released from the Navy Medical Corps and plans to practice at Atlanta, Georgia He was discharged at Jacksonville, Florida Dr Allen was a major in the Army Medical Corps before entering the Navy last March He was attached to the Army venereal control office in the South He was released from the Army last spring at his own request In the Navy, he served aboard a hospital ship at Okinawa *

• • •

Dr Jay T Dunigan, of Albany, is back in private practice after more than three years of Army service He was a captain

A former district health physician with the Albany County Welfare Department, he entered the Army in June, 1942 He served in the Rhineland and Central European campaigns, mostly with the 9th Army and in evacuation hospitals On V-E Day he was in Germany and on V-J Day in Paris Before discharge he served at Rhodes General Hospital, Utica *

Cattaraugus County

Dr Norman P Johnson and Dr George C Cash, both recently discharged from the Army, have opened offices in Olean

Dr Johnson will confine his practice to general surgery and Dr Cash to obstetrics

Dr Johnson, a Fellow of the American College of Surgeons, was honorably discharged as a major September 20 He was commissioned an Air Corps captain in 1942 and after serving at station hospitals at Foster Field and Eagle Pass, Texas, went overseas in November, 1944 He was awarded two battle stars for the Central European and Rhineland campaigns

A graduate of the University of Buffalo Medical School, he entered practice in Olean in 1935 with the late Dr J Ross Allen

Dr Cash was honorably discharged as lieutenant colonel after five years service He served two years on a transport in the South Pacific Following this duty, he was in charge of the U S Army Hospital, Prince Rupert, Canada

A native of Iowa City, Iowa, he received his medical degree from the University of Nebraska, Omaha, and practiced four years in Oregon before entering the Army *

Chautauqua County

Comdr William F Hoover, who has been consulting dermatologist for the Navy Department, has returned to Jamestown to resume his practice of dermatology

He received his commission as lieutenant commander in October, 1942, reported at Sampson Naval Training Station, and was transferred for duty at the U S Naval Dispensary in Washington, D C, in April, 1943, where he was on active duty for two and a half years As consulting dermatologist his work covered the Senate, State Department, and White House His promotion to commander was given in June *

• • •

Dr Ernest G Homokay has been released from the United States Army and will return to practice in Silver Creek after a month's vacation

Following enlistment in the Medical Corps, Dr Homokay was sent to Fitzsimmons General Hospital, Denver, Colorado, where he was a ward officer in general medicine In May, 1944 he was transferred to Mason General Hospital, Brentwood, where his duties were with soldiers suffering from anxiety developed, due to fear and worry, on the battlefield Dr Homokay will reopen his office about March 1, 1946 *

Chenango County

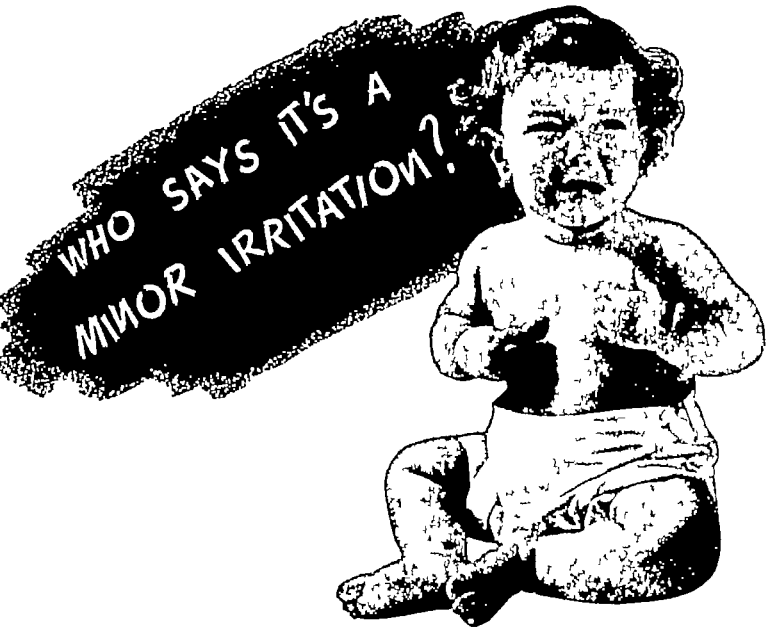
The officers and committee chairmen of the Chenango County Medical Society for 1946 are as follows president, William D Mayhew, Oxford, vice-president, John A Hollis, Norwich, secretary-treasurer, John H Stewart, Norwich, legislative committee, A K Benedict, Sherburne, economics, C W Chapin, Greene, public health and education, N C Lyster, Norwich, maternal welfare, L T Kinney, Norwich, subcommittee on tuberculosis, E F Gibson, Norwich, council on medical service and public relations, John H Stewart, Norwich, and compensation, T F Manley, Norwich

• • •

Dr John A. Hollis, of Norwich, recently was discharged from the Army, where he served as captain in the Medical Corps

Dr Hollis was engaged in military service for two and one half years and for eighteen months of that time was overseas During his war experience he had extensive experience in neurosurgery, his army service being particularly confined to this branch

As soon as arrangements can be completed Dr Hollis plans to resume his practice in Norwich *



Clinton County

Dr James J Reardon, whose practice of medicine in Plattsburg was interrupted in May, 1942, when he was summoned to military duty with the Army Medical Corps, has reopened his office in Plattsburg

Dr Reardon was released from the Army Medical Corps on October 5 of this year Two years of his forty-one months of service were on overseas as-

signment which took him to England, France, Belgium, Holland, and Germany He held the rank of major *

• • •

With more than three years of military service behind him, and all of that service, with the exception of the first few weeks, being experienced overseas, Dr Elmer Wessell, of Plattsburg, who is on terminal leave from the U S Army Medical Corps, reopened his office in Plattsburg on December 1 He will devote his future practice to obstetrics and gynecology *

Cortland County

The annual meeting of the county society was held on December 21 At that time the following officers were elected for 1946 president, Dr Fred A Jordan, Cortland, vice-president, Dr William F Newcomb, Homer, secretary, Dr W A Wall, Cortland, treasurer, Dr F F Sornberger, Cortland, compensation-arbitration committee, Drs F F Sornberger, J E Wattenberg, and C J Kelly, legislation, Drs W A Wall, P W Haake, Hans Hirsch, and W A Shay, public health, Drs C E Chapin, R P Higgins, D B Glezen, and Robert Fairchild, and public relations, Drs D R Reilly, W J Pashley, S A Ver Nooy, and R. H Brink

Dutchess County

The annual meeting of the Dutchess County Medical Society was held in the pavilion of the Hudson River State Hospital, Poughkeepsie, on January 9 at 8 30 P M Election of officers for the ensuing year was held

• •

Dr Maxwell Harrison has opened offices in Beacon, specializing in diseases of the eye, ear, nose, and throat He studied medicine at the Anderson College of Medicine, Glasgow, Scotland, and was graduated in 1940 Because of war conditions he was one of the first to fly to the U S A by Clipper *

Erie County

Maj Ernest B Eldridge, of North Tonawanda, prewar anesthetist, after spending forty months with the Army Medical Corps in service in North Africa, Italy, and England, is home on terminal leave, and has resumed practice in North Tonawanda He conducted extensive work in his specialized field during his period of service with the Medical Corps *

Franklin County

The Saranac Lake Medical Society met on January 2 in the John Black Room of the Saranac Laboratory for a surgical symposium in the form of an "Information, Please" program. Cases were presented by Dr Edwin M Jameson

Greene County

At the annual meeting of the Medical Society of the County of Greene the following officers were elected president, Frances E Persons, Lexington, vice-president, Benjamin Miller, East Durham, secretary, William M Rapp, Catskill, treasurer, Mahlon H. Atkinson, Catskill, chairman of public relations committee, A B Daley, Athens, chairman of legislative committee, Percy G Waller, North Baltimore, and delegate, Kenneth F Bott, Greenville

Jefferson County

Dr Thomas P Hamilton, Jr, of Watertown, has opened offices for the practice of general surgery there

Dr Hamilton was honorably discharged from the Army in September He was serving as a major in the Medical Corps *

Kings County

A contribution of $5,000 from Henry Wetstein, of the H S Chandler Company, of Manhattan, for a study of the usually fatal skin disease, pemphigus vulgaris, has been received by the Long Island College of Medicine, it was announced by the college recently

Dr Arthur W Grace, professor of clinical dermatology and syphilology, will conduct the research, a continuation of studies started by him at New York Hospital

Shortly before coming to the college in 1938, Dr Grace and his colleagues at New York Hospital succeeded in isolating a virus from several cases of the disease With the new grant, Dr Grace plans to obtain more strains of the virus, which probably is the hitherto unknown cause of the disease, and to develop materials to aid in treatment Two rooms in the Hoagland Laboratory Building are being equipped for the research

There have been more cases of the disease in Brooklyn in recent years than in any other part of the metropolitan area, according to college authorities Since most of the persons who have contracted the disease are from central Europe, experts think it originates in Poland, western Russia, and around the shores of the Mediterranean *

Madison County

Maj Edward G Hixson, first Oneida physician to enter the armed forces during wartime, in February, 1941, has returned to Oneida after four years of foreign duty

A letter of commendation on Major Hixson's record reads "During those periods, your hours of duty were long and difficult, and by your untiring zeal and complete devotion to duty, you have been instrumental in the saving of many lives and the alleviation of much suffering among our wounded soldiers"

Major Hixson has been awarded the American Defense ribbon, American Theater ribbon, and Asiatic-Pacific Campaign ribbon with a battle star On June 12, 1943, he was awarded the Legion of Merit Medal, one of the Army's highest awards, "for exceptionally meritorious conduct in the performance of outstanding service" *

Monroe County

Dr James S Houck was installed on January 1 as president of the Medical Society of the County of Monroe at the 125th annual meeting of the society in the Academy of Medicine

Others to take office included vice-president, Dr William A McVay, secretary, Dr Charles S Lakeman, and treasurer, Dr John L Norris Delegates to the state society were Dr Joseph P Henry and Dr Lakeman, with Dr C Stewart Nash and Dr Norris as alternates

Col. Edward T Wentworth, commanding officer of the 19th General Hospital during its service in

WINTER TIME is the season of throat affections.

Thantis Lozenges are especially effective in relieving these conditions, because they are anesthetic and antiseptic for the mucous membranes of the throat and mouth. The active ingredients dissolve slowly in the mouth, providing continuous soothing medication of the area.

Thantis Lozenges contain Merodicein (H.W & D Brand of Dilodooxymercuriresorcinsulfonphthalein-sodium), 1/8 grain, and Saligenin (Orthohydroxybenzyl alcohol, H W & D), 1 grain. They are effective, convenient and economical.

Thantis Lozenges are supplied in vials of twelve lozenges

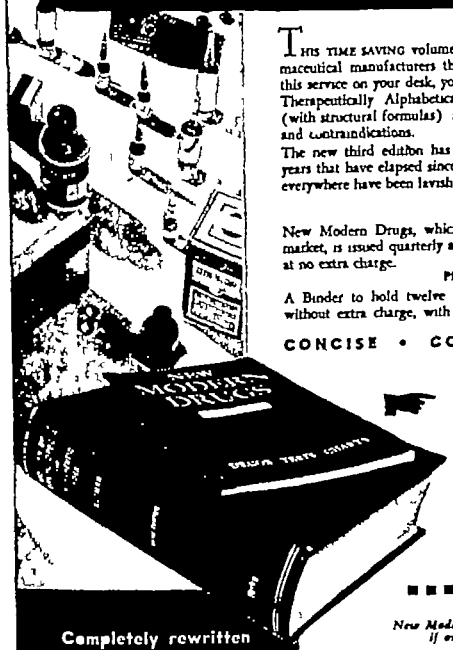
Rensselaer County

Dr Eugene F Connally, of Troy, was awarded a fellowship by the International College of Surgeons at the tenth national assembly of the United States Chapter of the college in the Mayflower Hotel, Washington, D C , in December Dr Connally, veteran of World War I and a practicing physician and surgeon in Troy since 1915, holds a fellowship in the American College of Surgeons and is a member of the Rensselaer County Medical Society, the Medical Society of the State of New York, and the American Medical Association *



READY SOON!

The New, Completely Rewritten, 3rd Edition

MODERN DRUG ENCYCLOPEDIA AND THERAPEUTIC INDEX

Edited by ALEXANDER B. GUTMAN, M.D., F.A.C.P.

Assistant Professor of Medicine, College of Physicians and Surgeons Columbia University. Associate Attending Physician Presbyterian Hospital and Vanderbilt Clinic, New York

THIS TIME SAVING volume presents 8140 Ethical drugs of American pharmaceutical manufacturers that doctors use in their every-day practice. With this service on your desk, you may quickly refer to any medicinal preparation, Therapeutically Alphabetically or by Manufacturer and find its composition (with structural formulas) action, uses, supply and dosage, as well as cautions and contraindications.

The new third edition has been completely rewritten and reset. In the five years that have elapsed since the publication of the second edition, purchasers everywhere have been lavish in their praise of this service.

KEPT UP TO DATE

New Modern Drugs, which completely describes new drugs placed on the market, is issued quarterly and is sent to purchasers of the Drug Encyclopedia at no extra charge.

PRE PUBLICATION OFFER

A Binder to hold twelve issues of New Modern Drugs will be included, without extra charge, with every order received prior to publication.

CONCISE • COMPLETE • AUTHORITATIVE

Invaluable!

Your book is invaluable and unique—indispensable, in fact, to me.
This book has saved us a lot of time, given us much valuable knowledge We will always buy the new one Keep it high type That's your market.

Splendid!

This is a splendid service, I could not get along without it.
Circulars and catalogs are mislaid. Not so, if in a book. The book makes a grand reference. I refer to it every day It is my bible. I am in love with the book.

Woman's Auxiliary

To the Medical Society of the State of New York

County News

Erie County The December stated meeting was a Christmas Party and luncheon in the Chinese Room of the Hotel Statler, Buffalo, on December 11, at which time election of officers took place. *Christmas carols were sung by the* members who were accompanied on the piano by Mrs Patrick H J Buckley, while a jolly Santa Claus distributed gifts.

Brief annual reports were read by all the of ficers and the chairmen of the standing committees and the historian Mrs. Fred S Hoffman, gave a detailed report of all the activities of the Auxiliary during the entire year of 1945

Mrs Hoffman drew attention to the fact that there had been a few changes made in committees, also that the date and time of executive board meetings had been changed. A résumé of the Auxiliary's activities of the year follows

The Erie County Medical Society placed a column in their enlarged *Bulletin* for our publications.

The Program Committee furnished a well-rounded schedule of events for the year each meeting opening with a luncheon

The Advisory Council were our guests in January

The Clothing Conservation Program was held in February, in March, a potpourri of reading, a cosmetic demonstration was given in April, Dr Leslie A. Osborn gave a lecture on psychiatry in May, and playday was celebrated in June.

In September Dr E Hoyt DeKleine gave a lecture on "Plastic Surgery", in October we had a book survey and Dr Wilmot Jacobson gave a lecture in November on endocrinology phases of interest to women

During the year seven afghans were knitted by a group of members and were donated to the American Red Cross for distribution to veterans' hospitals. Cookies were *supplied each month to transient servicemen.*

We acquired twenty three new members in 1945, but we mourn the loss of Mrs. R. H. Thornbury of North Collins

It was reported that eighty members had husbands in the service.

The record of subscriptions to the *National Bulletin* has been retained

Two hundred wires were sent to Albany in opposition to the Seely Brees Bill to license the practice of chiropractors, which was defeated 96 to 43

The Woman's Auxiliary to the Medical Society of the County of Erie was signally honored for the second consecutive year when Dr Abraham H. Aaron, president of the Erie County Medical Society appointed Mrs. Jesse G Levy, chairman of the Auxiliary's *Economics and Public Relations Committee*, to serve on the same committee of the Medical Society of the County of Erie (ex officio) In this capacity Mrs Levy's work has been in the nature of liaison between the two groups.

April having been designated by the National Cancer Control Board as their campaign month, unusual stress was placed on an evening mass meeting to be held in the Hotel Statler, sponsored by the Erie County Medical Society and the Auxiliary

Invitations were sent to organizations in the Eighth District, and Field Army leaders also endeavored to make this an outstanding educational effort to inform the public about this disease. Organizations of diverse interests united to insure the success of the huge undertaking Eight hundred letters were sent to organizations in Erie County posters were distributed in stores, schools hospitals and strategic places. The result was that many were turned away from the meeting. More than twelve hundred persons listened attentively to Dr Louis C Kress, director of the State Health Department's Division of Cancer Control Questions followed the address. This was one of the best-attended public discussions on the subject ever held in an American city

Our Auxiliary was honored by the appointment of Mrs. Lee R. Sanborn as state chairman of *Hygeia*

The Executive State Board met in Buffalo in April, with Mrs Carlton E Wertz presiding The honored guests were Mrs David W Thomas, national president of Auxiliaries of the American Medical Association, Dr Carlton E Wertz chairman of the Advisory Council for the State Auxiliary and Dr A H Aaron president of the Erie County Medical Society At the close of the meeting, Mrs. Wertz turned the gavel over to the incoming State President, Mrs. Edwin A Griffin Mrs. William Rennie was chairman of arrangements for the two-day meeting

The executive board of our Auxiliary was delightfully entertained at luncheon in the Hotel Statler, on November 13 by our retiring president Mrs Rennie

Through the careful arrangements made by the hospitality chairman and the chairman of the House Committee we have had hostesses to greet us when we entered the assembly room, with the Collect either handed to us or already placed on the chairs.

*The chairman informed us that one hundred mem*bers manned the bond booth during the year with sales of stamps and bonds totaling $340 349 45 so far this year which far exceeded the quota.

With the approval of the Advisory Board the Committee on Health and Hygeia undertook the project of placing *Hygeia* Magazine in public elementary and high schools in Erie County Each school was sent an attractive blue card acknowledging the gift. The project was financed by an arrangement with the Twentieth Century Theatre for certain nights during the month of November tickets were sold at sixty cents each, fifteen cents of which was credited to the Auxiliary The proceeds were $866 75

Those elected to office for 1946 are as follows president, Mrs John D Naples president-elect *Mrs Arthur L. Bennett, first vice-president* Mrs. Benjamin Smallen, second vice-president, Mrs. James G Fowler, treasurer, Mrs George E. Slotkin, recording secretary, Mrs. Arthur J Reisdig corresponding secretary Mrs. Joseph W Madden director for three years, Mrs Patrick J Hurley

The delegates are Mrs. Arthur L. Bennett, Mrs. Allen E. Richter, Mrs. Louis G Fuchs Mrs. William Rennie, Mrs George E Slotkin Mrs Franklin C Farrow Mrs Fred G Carl Mrs John G Gabbey Mrs Clarence J Durshordwe Mrs Francis O'Gorman Mrs Herbert J Donnelly Mrs

Arthur F Glaeser, Mrs John A Post, and Mrs Ralph Upson.

Alternates are Mrs Stuart A Good, Mrs Kenneth G Jahraus, Mrs James B Vaughan, Mrs John C Grabau, Mrs Joseph J Pisa, Mrs Harold F R Brown, Mrs Elmer A D Clarke, Mrs Walter S Goodale, Mrs Anthony J Cetola, Mrs Edward C Koenig, Mrs Michael Barone, Mrs George F Marquis, Mrs Benjamin Smallen, and Mrs Daniel Stedem

Nassau County The annual Christmas meeting of the Woman's Auxiliary to the Nassau County Medical Society was held on December 11 at the Nassau Hospital auditorium, Mineola Mrs Louis A Van Kleeck presided

Mrs Leona Davis played vibraharp selections, and Mrs Richard H Sugar presented monologues Community singing of carols and charades preceded the refreshment hour, at which Mrs John L Neubert was chairman, assisted by Mrs R R Galione About sixty-five members were present and, as has been the annual custom, all brought gifts to be distributed to foster children in Nassau County The auditorium was decorated with Christmas greens and candles and holiday ribbons, and eggnog and Christmas cookies were served

The executive board met on December 11, at the hospital to discuss early winter events Another board meeting was scheduled for January 22 at 10 15 A.M in the medical sessions room at the Hospital The Auxiliary celebrated its tenth anniversary on January 29 at 8 30 P M at the Nassau Hospital auditorium, Mineola Mrs Edwin Griffin, State Auxiliary president, was a guest at the affair, and Mrs M Moghtader, of Manhasset, historian of the Nassau unit, presented a history of the organization

Oneida County The Woman's Auxiliary to the Medical Society of the County of Oneida held a meeting on November 13, at Hutchings Hall, Utica State Hospital, with Mrs Bradford F Golly presiding Nineteen members braved a heavy deluge of rain to attend the business meeting, which was followed by a scientific program

Dr Oswald J McKendree, medical director of the Utica State Hospital, as the speaker reviewed the study of psychiatry, pointing out the different classes of mental disease During the question period which followed, many references were made to rehabilitation of returning veterans

The next meeting will be held at the Fort Schuyler Club in February, in Utica

Orange County On December 6, 1945, the regular winter meeting of the Woman's Auxiliary to the Medical Society of the County of Orange was held in Port Jervis at a luncheon Fifteen members from Newburgh, Middletown, and Port Jervis were present, despite the bad road conditions existing throughout the country

Mrs Walter A Schmitz presided, and called on Mrs Harry F Pohlmann, of Middletown, chairman of the Orange County Cancer Control Drive and the Middletown Field Army of the American Cancer Society, for a report of the Cancer Control meeting held in Middletown on October 30 This was an open meeting sponsored by the Orange County Woman's Auxiliary and assisted by Dr Charles E Lane, of Newburgh Dr Louis C Kress, director of the New York State Institute for the Study of Malignant Diseases, in Buffalo, spoke to an audience of more than five hundred people who had come from all over the county to the Assembly Hall of the State Hospital, at Middletown A great amount of publicity had been given by the sending of over one thousand letters to churches, schools, factories, and service clubs, as well as all other newspapers in each community in the county through the splendid assistance of one of Middletown's reporters, Miss Gladys De Freitas The interest aroused in the audience was inspired by the large number of questions given to the group of Orange County physicians who assisted Dr Kress in the question period following his talk

Mrs Schmitz gave a résumé of the meeting of the House of Delegates of the State Society, which she and Mrs Pohlmann attended on October 8 and 9 in Buffalo

The Auxiliary is sponsoring a series of radio talks, approved by the County Medical Society and given once a month over the local radio station, WALL The second series, given on December 12, was entitled "The Common Cold and Pneumonia"

At the meeting on December 6 a donation was voted for the Physician's Home, and the following delegates to the annual meeting, to be held next May, were elected Mrs Walter A Schmitz, of Middletown, Mrs Frederick Small, of Newburgh, and Mrs Harrison Murray, of Port Jervis Alternates are the following Mrs Frederick Seward, of Goshen, Mrs W W Davis, of Chester, and Mrs Roswell Schmitt, of Middletown

The next meeting will be the Spring meeting, to be held in Middletown in April

---

NEW WEAPON TO AID WAR ON HEART DISEASE

The portable cardiotron, a new scientific weapon in the fight against heart ailments—the leading cause of death in America—was exhibited on January 3 by its inventor, Paul Traugott, before a group of cardiologists and newspaper men at Hampshire House, New York City

The machine, about the size of a table-model radio, eliminates need for photographic and darkroom procedure which characterized old-style electrocardiographic equipment and makes it possible, said the inventor, to record instantly and permanently on graph paper the minutest heart action or variation

Mr Traugott, president and chief engineer of Electro-Physical Laboratories, a division of Electronic Corporation of America, has passed more than twenty years in work on electromedical apparatus He said that the machine enables any physician to make a cardiogram as a routine part of diagnosis and eliminates the delay formerly entailed in photographic work

The portable cardiotron weighs only 34 pound and has been successfully tested under office, hospital, and field conditions for more than two years Mr Traugott said It is designed to magnify 14,000 times the electrical impulses that accompany heart action A stylus traces the cardiac action on special processed paper which feeds out of the machine at controlled speeds like ticker tape —*N Y Herald Tribune, Jan 4, 1946*

For the symptomatic relief of sinusitis...

"The benzedrine inhaler is an excellent vasoconstrictor and unless overindulged in, it may be used conveniently for long periods without deleterious results." Moore J H A Resume of Conservative Sinus Management, Southern Med. J 34 848 854

The vasoconstrictive vapor of Benzedrine Inhaler, N.N.R., diffuses evenly throughout the upper respiratory tract, opening sinal ostia and ducts which are frequently inaccessible to liquid vasoconstrictors. The sinuses drain. Headache, pressure pain, "stuffiness" and other unpleasant sinusitis symptoms are relieved. Each Benzedrine Inhaler is packed with racemic amphetamine, S.K.F., 200 mg.; menthol, 10 mg.; and aromatics. Smith, Kline & French Laboratories, Phila., Pa.

Benzedrine Inhaler

...a better means of nasal medication

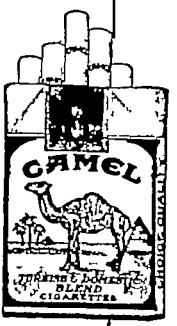
More pleasure to you, Doctor!

THREE nationally known research organizations recently reported the results of a nationwide survey to discover the cigarette preferences of physicians and surgeons

Physicians all over the United States were asked the simple question "What cigarette do you smoke, Doctor?" The question was put solely on the basis of *personal preference as a smoker*

The thousands and thousands of answers from these physicians in every branch of medicine were checked and re-checked The result

> **More physicians named Camel as their favorite smoke than any other cigarette. And the margin for Camels was most convincing**



Certainly the average physician is busier today than ever before and is deserving of every bit of relaxation he can find in his day by-day routine a cigarette now and then if he likes And the makers of Camels are glad to know that physicians find in Camels that extra margin of smoking pleasure that has made Camels such a favorite everywhere

According to this recent nationwide survey

More Doctors Smoke Camels

than any other cigarette

R. J. Reynolds Tobacco Company Winston-Salem, N. C.

A firm position in the therapy of rheumatoid arthritis

Gold has proved its worth during the fifteen years it has been used for rheumatoid arthritis and today holds a firm position among chemotherapeutic drugs Clinical reports indicate that improvement may be expected in eighty per cent or more of patients *receiving adequate amounts of gold*

SOLGANAL-B OLEOSUM

SOLGANAL-B OLEOSUM is a special preparation of organic gold, aurothioglucose It is water soluble, but suspended in oil to prolong its absorption and enhance its safety Being an *organic* gold compound, SOLGANAL B OLEOSUM is less toxic than the *inorganic* gold salts and yet equally efficient.

SOLGANAL-B OLEOSUM (aurothioglucose, $C_6H_{11}O_5SAu$), containing approximately 50 per cent gold is administered by intramuscular injection in repeated courses with intervening rest periods It is available in several strengths to permit flexibility of dosage

The Medical Research Division welcomes inquiries and will supply literature on SOLGANAL-B OLEOSUM dealing with its manner of use, dosage, precaution and toxicity

Trade-Mark SOLGANAL-B OLEOSUM—Reg. U. S. Pat. Off.

When infection impairs Vaginal physiology

Most infections of the lower genital tract disrupt normal vaginal physiology, resulting in lowered acidity or even alkalinity Clinical evidence has shown that a restoration of the normal pH constitutes the *simplest, most direct form of effective therapy*

• Aci-jel, a bland, water dispersible, buffered, acid jelly provides a ready, efficacious method of inhibiting the growth of pathogenic organisms by restoring the normal vaginal flora • The usual dosage is 5 cc. (one applicator full) intravaginally before retiring and again in the morning, followed 8 hours later with a cleansing douche Aci-jel is available in 3-¼ oz tubes, with or without measured applicator

ETHICS

There can be no middle course between the ethics of the medical profession and the temptations of the market place in the field of anatomical supports Here the standards of the businessman must be elevated to the standards of the doctor because the customer of the businessman is the patient of the doctor Anything else is "merchandising quackery" We at Camp have for many decades controlled our distribution throughout the recognized retail institutions which like the doctor have earned the respect and confidence of their home communities No appeal is used in our advertising approach to the consumer which fails to meet the precepts of the profession We serve the physician and surgeon by living up to our chosen function of supplying scientific supports of the finest quality in full variety at prices based on intrinsic value We try to insure the precise filling of prescriptions through the regular education and training of fitters In cooperation with medical and educational public health authorities we play the role our resources permit in promoting better posture and body mechanics That is our idea of the practical ethical standards which permit the businessman to solicit the recommendation of the doctor

Camp Anatomical Su
ports have met the exacti
test of the profession for fo
decades Prescribed and recor
mended in many types for prenatal, pos
natal, postoperative, pendulous abdomen, p
ceroptosis, nephroptosis, hernia, orthopedic a

Maltbie's New Intranasal Bacteriostatic Vasoconstrictor

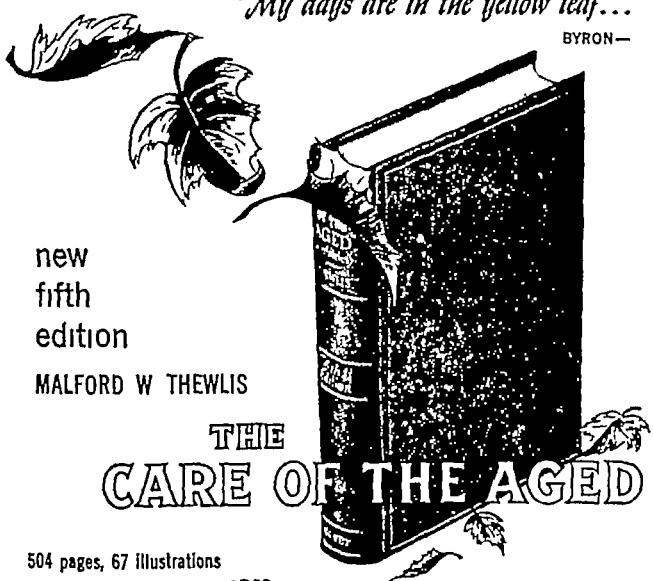
Restorative treatments in the relaxing environment of the Saratoga Spa have become more widely known in medical circles as, year by year, increasing numbers of physicians have found them beneficial to patients

The therapeutic powers of the Spa's naturally carbonated mineral waters are being utilized more extensively than ever, for postwar strain is bringing us an unusually large number of patients suffering from cardiac, rheumatic or vascular disorders of a chronic nature

Here your patient, relaxed in mind and body, is in skilled hands which are guided by your directions in a regimen of treatment that you recommend Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Thus the Spa lightens your heavy burden, with full assurance that your patient will receive the best of care to prepare him for your continued medical direction

THE SARATOGA SPA



"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still lie ahead

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

For professional publications of the Spa, and physician's sample carton of the bottled waters, with their analyses, please write W S. McClellan, M D, Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

Address

NO MESS...
NO GREASE...
NO SCABIES

You remember how just hearing that a certain patient had scabies or pediculosis would make you itch even if you never went near him And you remember only too well the ointment-smeared bedding that seemed the only way to get rid of the pesky skin parasites.

Now all this is obsolete With 'Wellcome' Benzyl Benzoate Emulsion, the patient is merely painted with a clean, *non-greasy* emulsion, and when he bathes twenty-four hours later, the parasites are dead Recurrence and dermatitis are infrequent

'WELLCOME' BRAND

BENZYL BENZOATE

EMULSION 50%

Diluted with an equal volume of water before application 2 or 3 fluid ounces of the 25% emulsion is usually sufficient for one treatment.

BOTTLES OF 4 FL. OZ.

Cut the Gordian Knot

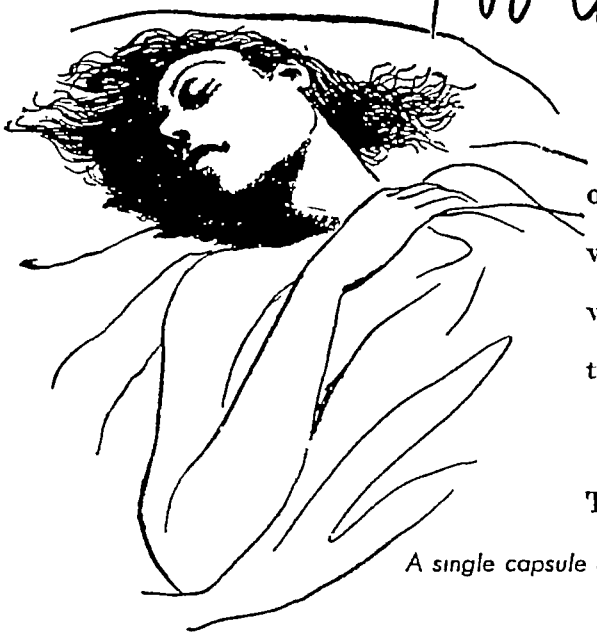
OF BILIARY CONSTIPATION ..

caused by biliary dysfunction, and biliary stasis initiated by constipation by prescribing VERACOLATE cholagogue evacuant • Veracolate is simple and specific in the treatment of biliary constipation—by stimulating the secretion of bile through administration of bile salts; and by promoting peristalsis with small amounts of reliable evacuants

MARCY LABORATORIES, INC
113 WEST 18th STREET, NEW YORK 11, N Y

Veracolate' CHOLAGOGUE EVACUANT

SUPPLY: 'Veracolate' cholagogue evacuant*— in bottles of 50 tablets each tablet containing bile salts (sodium taurocholate and glycocholate), extract cascara sagrada phenolphthalein oleo resin capsicum.



DOSAGE: 1 tab t i d, or 2 tab at bedtime

Modified 'Veracolate' cholagogue evacuant in bottles of 50 tablets, each tablet contain bile salts (sodium taurocholate and glycocholate) phenolphthalein, oleoresin capsicum, pepsin pancreatin

DOSAGE 2 tablets 2 hrs. after meals.

*(*Recommended for adult use only)*

For the new Concept

of supplying sick patients, who have mixed vitamin deficiencies, with all the essential vitamins in doses of therapeutic magnitude, specify

SQUIBB

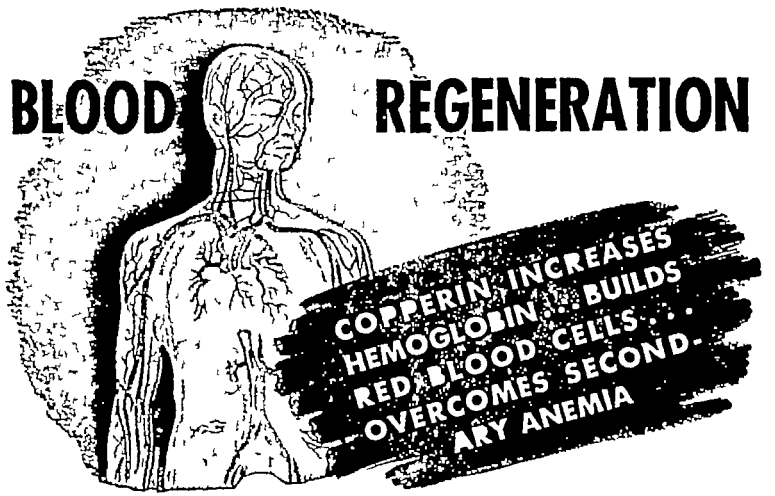
THERAPEUTIC FORMULA

A single capsule contains

Vitamin A	25,000 units
Vitamin D	1,000 units
Thiamine HCL	5 mg
Riboflavin	5 mg
Niacinamide	150 mg
Ascorbic Acid	150 mg.

For the continuing Concept

of supplying well patients with maintenance dosage levels of all the vitamins as recommended by the Food and Nutrition Board of the National Research Council, specify



SQUIBB

SPECIAL FORMULA

A single capsule contains

Vitamin A	5,000 units
Vitamin D	800 units
Thiamine HCL	2 mg
Riboflavin	3 mg
Niacinamide	20 mg
Ascorbic Acid	75 mg

SQUIBB . MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

Before Copperin appeared, massive iron doses were inflicted on the anemic Most of the iron was not utilized The excess, excreted fecally, produced gastrointestinal irritation and upset—thus defeating the original purpose of the clinician

Copperin represents a scientific conception of iron needs in secondary anemia The iron content per capsule is small — 32 mgm — but wholly adequate The potent catalytic agent, copper sulphate, makes ALL the iron available for regenerative processes

There is rapid replacement of hemoglobin and new red cells This is markedly manifested in treating the hypochromic anemia *of children, the "milk anemia"* of infants, hemorrhagic anemia following blood donation, pregnancy anemia, chlorosis and anemia of middle aged women

In two strengths Copperin "A" for adults, Copperin "B" for children

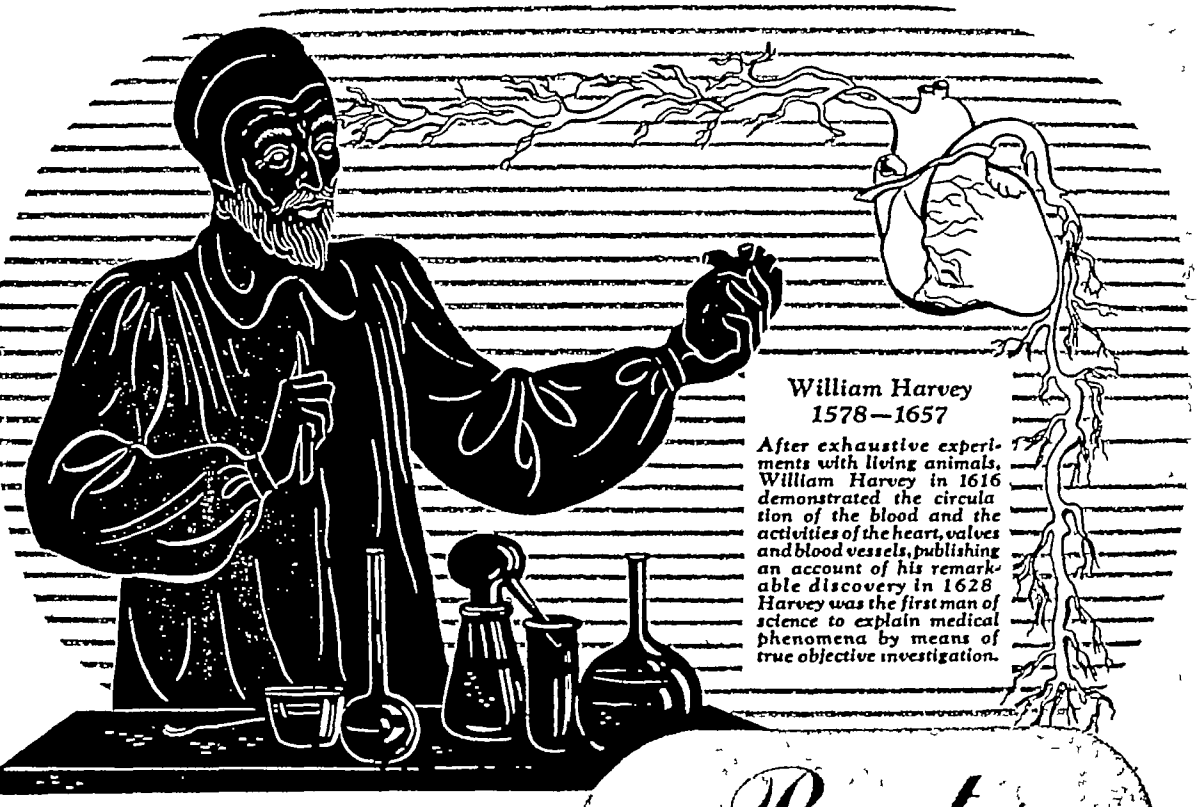
SUPPORTING THERAPY in LIVER DAMAGE

Support in impaired liver function and hepatic damage, in many stubborn cases, is safely attained through the use of

SORPARIN

(Ext. Sorbus aucuparia McNeil)

Conspicuous among the pharmacodynamic actions of this recently re investigated botanical are



- Sorparin stimulates the functioning of liver cells
- In a large majority of cases Sorparin dispels the indefinite dyspepsias frequently associated with hepato-biliary dys function.
- Is not a cholagogue nor a choleretic—may be used in obstructive types of jaundice.
- No known contraindications.
- May be used with safety in combination with bile salts (although these are not required for therapeutic efficacy) with vitamin K, antispasmodics, sedatives or sulfonamides without incompatibility

CLINICAL INDICATIONS: Hepatitis, with and without jaundice, toxic and obstructive jaundice chronic cholecystitis with and without stone, idiopathic hypoprothrombinemia and post surgical biliary symptoms.

Available in tablets each containing Sorparin 3 gr Bottles of 100, 500 and 1000. Literature on request.

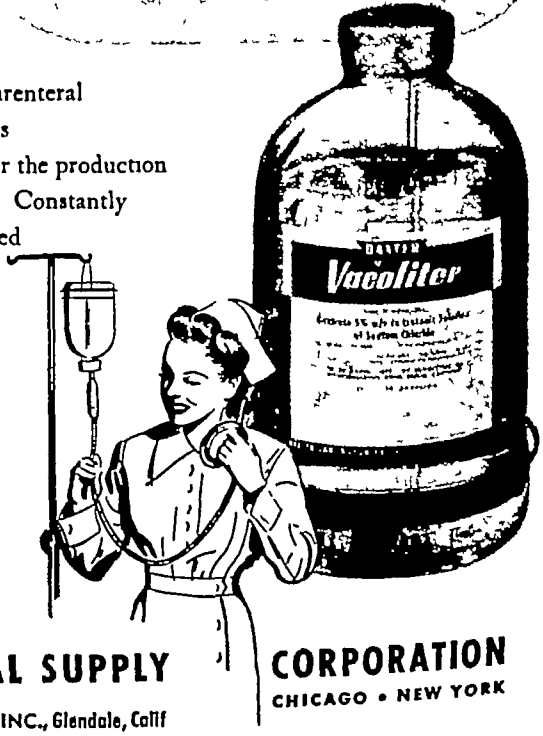
PIONEERING THAT POINTS TO *DISCOVERY* *DISCOVERY* THAT *DEMANDS* LEADERSHIP

William Harvey
1578—1657

After exhaustive experiments with living animals, William Harvey in 1616 demonstrated the circulation of the blood and the activities of the heart, valves and blood vessels, publishing an account of his remarkable discovery in 1628. Harvey was the first man of science to explain medical phenomena by means of true objective investigation.

Baxter... first in parenteral solutions in mass dosage form

Baxter



PIONEERS IN PARENTERAL THERAPY

William Harvey's discovery was the first step in preparing the way for modern parenteral therapy. In 1928—just three hundred years after he made public his analysis of blood circulation—Baxter produced the first parenteral solutions in dispensing containers for large volume infusions.

Baxter was the first to design and develop equipment for the production of *safe*, ready-to-use solutions and techniques for their use. Constantly improved methods of testing and inspection have culminated in rigid and comprehensive tests which assure sterile, pyrogen-free, stable solutions in the Vacoliter.

Baxter's many years of pioneering and leadership in the field of parenteral therapy are your protection.

No other parenteral program is so complete, so trouble-free, so confidence-inspiring. No other method is used in so many hospitals.

Multiple Vitamin Supplementation

LOGICAL, ECONOMICAL PRODUCT FOR A LOGICAL NEE

EACH CAPSULE CONTAINS:

Vitamin A	5000 U.S.P units
Vitamin D	800 U.S.P units
Thiamine Hydrochloride U.S.P	3 mg.
Riboflavin	3 mg.
Ascorbic Acid, U.S.P	75 mg
Nicotinamide	20 mg.
Pyridoxine Hydrochloride	0.5 mg
Calcium Pantothenate	5 mg.
Mixed Tocopherols biologically equivalent to 3 mg. Alpha Tocopherol	

In those conditions for which multiple vitamin supplementation is rationally indicated,†

White's NEO MULTI-VI CAPSULES

offer a preparation formulated upon a sound therapeutic basis—realistic efficiency—practical usefulness—and *economy* to the patient.

The well balanced formula contains nine vitamins—including all clinically established vitamin in amounts safely above adult basic daily requirements,* yet not wastefully in excess of average patient's needs.

Small, easy-to-take capsules. Price to the patient is also small for comparable vitamin potency. The White name is assurance of stability and uniformity

†**Indications:** Routine prophylaxis against dietary deficiencies—increased metabolic rate—thyroid dysfunction, suspected border-line multiple deficiencies, suboptimal nutrition—restricted diets—the aged—wasting disease—pre- and post-operatively—in convalescence—pregnancy—lactation

Bottles of 25, 100, 500 and 1000 capsules

"THE GASTROINTESTINAL TRACT OFFERS ONE OF THE CHIEF LOCI FOR SUCCESSFUL THERAPEUTIC ACTION OF BELLADONNA PREPARATIONS"*

when the G. I. Tract "KICKS UP"

Administered in the presence of peptic ulcer, spastic colitis, mucous colitis, spastic constipation, diarrhea, pylorospasm, cardiospasm and other evidences of smooth muscle spasticity in the gastrointestinal tract—Donnatal affords all the advantages inherent in the pure, natural belladonna alkaloids in exerting peripheral action *without toxicity* At the same time it provides *non-narcotic* sedation

Donnatal is a *rational, balanced combination* containing *fixed proportions of the only belladonna alkaloids possessing therapeutic importance* (hyoscyamine, atropine and scopolamine), with minimal dosage of phenobarbital (¼ gr per tablet) The pharmacodynamic synergism provided by the three individual alkaloids—plus the sedation afforded by its barbituric acid component—renders Donnatal especially efficacious for long-term medication without danger of over-sedation Of interest to many patients, Donnatal may be prescribed at approximately *half* the cost of synthetic preparations!

AVAILABLE: In bottles of 100 tablets.
FORMULA Each tablet contains Phenobarbital ¼ gr —and belladonna alkaloids (hyoscyamine, atropine and scopolamine) equivalent approximately to 5 minims of Tr Belladonna

IS SODA-BICARBONATE NECESSARY IN SALICYLATE THERAPY

To be effective, the treatment of acute rheumatic fever must maintain a high salicylate level in the blood [1] When massive doses of sodium salicylate are given by mouth, an undesirable side effect—gastric distress—is frequently encountered To relieve this effect, equal amounts of sodium bicarbonate are given Unfortunately, a decided depression of the blood salicylate level results [2]

Gastric distress and its required relief by sodium bicarbonate are avoided when Salysal is given, for Salysal is not soluble in the acid medium of the stomach. Furthermore, 100 parts of Salysal provide 124 equiva lent parts of sodium salicylate [3] Thus, smaller doses accomplish the same effect

White's **OTOMIDE**

for topical chemotherapy in acute and chronic ear infections

The unique clinical advantages of this stable, non irritating solution of sulfanilamide, urea and chlorobutanol may be briefly summarized as follows

POTENTIATED ANTIBACTERIAL ACTIVITY—urea-sulfanilamide mixture more effective than either drug used independently [1] Not inhibited by pus and tissue debris.

BETTER TISSUE DIFFUSION—urea-sulfanilamide mixture diffuses more actively through living and dead tissues.[2]

TOLERANCE—freedom from alkalinity virtually obviates local chemical irritation.

ANALGESIA—effective chlorobutanol analgesia without impaired sulfonamide activity

WIDE FIELD—effective in BOTH acute AND chronic otologic infections. Active against certain sulfonamide resistant bacteria [3]

FORMULA

Sulfanilamide	5%
Carbamide (Urea)	10%
Chlorobutanol	3%
Glycerin (high sp. gr.)	q.s.

Palatable

PROTEIN HYDROLYSATE

When protein supplementation is necessary, palatability of the therapeutic agent is an important factor

The palatability[1] of AMINOIDS* has been demonstrated by ample clinical use. AMINOIDS blends tastefully with hot or cold liquids, and with numerous light foods, adding a distinctive flavor to puddings, custards, cereals, etc.** Palatability, plus avoidance of monotony, promote continued acceptance by the patient.

AMINOIDS, a protein hydrolysate product prepared by enzymatic digestion of beef, wheat, milk and yeast, contains the amino acids known to be present in these four high quality foods. AMINOIDS is readily absorbed from the digestive tract.

SUPPLIED In granular form, in bottles containing 6 oz. One tablespoonful t.i.d. provides approximately 12 grams of protein as hydrolysate.

Promotes Healing with Minimal Scarring

THE aim of therapy in severe burns, whether they cover large or small body areas, is to prevent excessive scar tissue deposition and subsequent deformities Remaining viable epithelial elements should not be injured Early epithelization should not be interfered with Therapeutic measures should be easily and quickly applicable

Morruguent Ointment readily fulfills these requirements Its cod-liver-oil concentrate presents a 25 per cent greater content of the unsaponifiable fraction than is contained in cod-liver-oil, U S P. It is free from objectionable fish-oil odor Morruguent retards or prevents infection, reduces systemic absorption of toxic metabolites, hastens granulation and epithelization, and results in a pliable, elastic epithelial surface Healing takes place with a minimum of surface disfiguration

Morumide Ointment, 10% sulfanilamide in a suitable base incorporating cod-liver-oil concentrate, has been found particularly useful in the management of burns of the face, hands, and perineum

MORRUGUENT & MORUMIDE

Morruguent and Morumide Ointments are supplied in 2-oz. tubes and in 1-lb. jars

ALKALOL in head colds

ALKALOL has decided mucus solvent properties After its use the mucous membrane passages are cleansed and soothed

Sample by request — **THE ALKALOL CO., TAUNTON. MASS.**

Almost every physician is aware of the good results to be obtained with massive doses of vitamin C in various allergies, as well as in many other conditions due to vitamin C deficiencies—yet he hesitates to adopt this therapy because of the irritative and acid-shift effects that so frequently result from large doses of this vitamin

SODASCORBATE (sodium ascorbate) is often helpful in these cases For the first time the profession is offered a *neutral*, stable vitamin C in tablet form, free from the usual irritative and acid-shift effects of ascorbic acid

Now you can administer *full* and *frequent* doses of vitamin C without such undesired side-effects Each *SODASCORBATE* Tablet contains 120 mg of sodium ascorbate, equivalent in vitamin C activity to 100 mg (or 2000 U.S P Units) of ascorbic acid The tablets are scored to permit ready adjustment of dosage

The average dose for adults and children over 12 years is one tablet 3 times daily or as indicated by the condition For children under 12, one-half tablet. For babies or very young children, one-fourth to one-half tablet may be crushed and dissolved in milk

Supplied in bottles of 40 and 100 tablets as well as in "hospital-size" bottle containing 500 tablets For professional samples and covering literature, sign and mail the coupon

Editorial

The DiCostanzo-Crews Bill

I

In the legislature of the State of New York, the DiCostanzo-Crews anti-animal experimentation bill has been introduced, designed to restrict animal research in this State.

The passage of such a bill would effectually sabotage much medical research and retard progress in securing both to human beings and to animals themselves the benefits of tested and proved advances in the prevention and treatment of disease

The forces seeking such restrictive legislation

are well organized and well financed Nearly every state has its society, there are three national groups Doctors estimate conservatively that these spend at least $1,000,000 a year on propaganda.

Funds come largely from well-meaning sentimentalists who, like most decent people, love dogs, and who think antivivisectionism is humanitarian Hundreds of thousands of such people contribute small sums Large donations come from wealthy sympathizers. Within the last few years, two Chicago women left bequests of over $2,000,000 apiece to anti vivisectionist societies

In the United States, they have long aimed at a Constitutional amendment forbidding all experiments on living animals. As a beginning, they try to secure state and local laws against experiments on dogs

In Congress, Representative Lemke, Father Coughlin's former candidate for President, has introduced a bill forbidding dog experiments in the District of Columbia. In New York State, an antivivisection bill actually passed the Senate last year Record-breaking public protest later killed it [1]

Doctors will not have to be told, but will have to inform their legislative representatives promptly that

Millions of people in New York State owe their lives to medical research on dogs and other animals

Close to 90,000 diabetic persons in New York State alone are alive and well because research on dogs made possible the discovery of the cause of diabetes and the development of insulin

From 15,000 to 20,000 persons in New York State are active healthy members of the com-

[1] EMMENS, B., The Case for Vivisection, Pageant 1: 125 (Dec.) 1945.

munity because the use of dogs in medical research made possible the discovery of liver therapy in the once fatal pernicious anemia

The use of dogs in the laboratory made possible the discovery of plasma as a blood substitute, thus saving the lives of thousands of men wounded in the war The sulfa drugs and penicillin, too, were made available for human use only after development on animals

In New York State alone 130,000 stray, homeless dogs are killed by humane societies and dog pounds every year Medical science uses not even a fraction of this number And even this would be denied by the antivivisectionists

Dogs are essential in much of this research Their digestive and circulatory systems resemble closely those of man

In New York State today are some of the great medical centers of the world The public looks to them for the discoveries still to be made in the interest of humanity This knowledge may be blocked if the proposed bill is passed by the legislature of New York State

Some day the life of someone you love may depend on medical knowledge yet to come Help kill legislation that may deny new medical discoveries to you, your family, your friends

The good common sense of the American people and their legislative representatives can be trusted, in our opinion, to prevail if correct, accurate, and scientific information is made available to them Naturally, it is a proper, even an imperative, activity of the medical profession in the public interest, *including the interest of the advocates of anti-animal experimentation themselves,* to use every available means to disseminate the truth and to fight vigorously with facts the propaganda and ill-advised, even if well-meaning, sentimentalism of those who would prevent in this State and eventually in the Nation the properly safeguarded use of animals for medical and veterinarian research

Does it seem, in passing, a trifle absurd to attempt to restrict legitimate, properly controlled and safeguarded animal experimentation with benefit of anesthesia whenever possible where such experimentation accrues to the better health of what remnant is left of the human race, when we have just finished spending some billions of dollars in blowing *people* apart without benefit of anesthesia at all?

Actually, animals are completely anesthetized during surgical work, except in the very rare cases where anesthesia would defeat the purpose of the operation Many experiments, such as those which led to the discovery of liver therapy for pernicious anemia, do not involve surgery at all

Standards for the treatment of research animals, first developed back in the 1870's, are now enforced in the United States by a special committee of the American Medical Association Animals must not be maltreated. They must be kept clean, comfortable, well fed

Doctors point out that laboratory dogs are far better off than homeless dogs [2]

And while we are on the subject, how about the homeless people of the earth who haven't even the benefit of a bombed-out laboratory wherein they may take refuge? People protected by no such standards as those insisted upon by the American Medical Association for the humane treatment of laboratory animals?

The crusade of the advocates of anti animal experimentation is perennial It is supported by large money donations from many sources and by the enthusiasm of many lovers of animals It is well organized

> Legislative bills sometimes cover a wide field, such as the California bill in 1933 designed to "forbid universities, research laboratories, and experimental stations from using animals for experiments or demonstrations of any kind "[2]

Such legislation, if enacted, would be a calamity, the health of the people of this State would be seriously compromised at a time when both government and the medical profession are seeking ways and means to bring better health conditions to more people than ever before The DiCostanzo-Crews bill now before the legislature

> concentrates on prohibiting all experiments on the dog, the one animal which has been most valuable in the advancement of medical knowledge Most people are sentimentally attached to dogs, and an attempt is made to capitalize on this affection between man and dog

to death by humane societies and pounds of 130,000 stray dogs each year in New York State be allowed to say "stop" to research workers striving to conquer the remaining scourges of mankind by the use, under anesthetics, of only a small fraction of that number?

While there is still disease and suffering in the world dare anyone say "stop" to the service of the laboratory animal to humanity!

We think that while cancer, tuberculosis, and many other diseases which vitally affect the persons and lives of legislators, antivivisectionists, doctors, and the plain citizen-taxpayer remain unsolved, the common sense of the people and the integrity of the legislators may be relied upon to prevent such a calamity to legitimate medical research as is proposed by the DiCostanzo-Crews bill

Background of S 1050

Speaking of the background of the 1945 version of the Wagner-Murray-Dingell bill, Mr George P Farrell, Director of the Bureau of Medical Care Insurance, Medical Society of the State of New York, had this to say [1]

Most of us think the bill is a product of the social reformers of this country However, the bill is revealed as a product of the International Labor Organization The interlocking of national with international groups interested in social reform (including socialized medicine) had its start at the Arbitration Court of the Hague in 1899 It received official status as a private agency in Basel, Switzerland, in 1919 Under Part XIII, of the Versailles Treaty it achieved official status as a subsidiary of the League of Nations It moved its headquarters from Geneva, Switzerland, to Montreal at the beginning of World War II, it maintains a branch office in Washington, D C The original founders were the International Association for Labor Legislation and its various national affiliates Other international organizations with interlocking directorates lent needed assistance and among these was the international Association for Social Security which openly advocated the socialization of all phases of human endeavor

When did this country become involved in it? In 1919 the U.S Senate specifically withheld the assent of the United States from Part XIII of the Versailles Treaty Samuel Gompers, President of the American Federation of Labor, had withdrawn from the American Association for Labor Legislation and denounced it as un-American Despite senatorial skepticism about International Labor Organization's aims, however, the first officially approved International Labor Conference was held in Washington in December that same year In 1934, through an unheralded joint resolution, passed by Congress the United States became a member of the International Labor Organization and accepted the International Labor Organization's constitution

What is its purpose? It states its purpose as being "to promote social justice in all the countries of the world" To this end it collects facts about labor and social conditions, formulates international standards, and supervises their national application In seeking to supervise the national application of International Labor Organization standards, the International Labor Organization is obviously more than a mere fact-finding group

The International Labor office acts as a secretariat, an information center, and a publishing house It is staffed by experts drawn from many different countries whose knowledge, experience and advice are available to all the nations which are members of the organization. For medical care planning there are at least three Americans among this group of experts Chairman of the Social Security Board, Director of the Social Security Board's Bureau of Research and Statistics, and its assistant director None of them are physicians

In 1943 and 1944 the International Labor Organization put finishing touches on one hundred fourteen proposals for the "improvement and unification of medical care services" Many of these are embodied in the Wagner-Murray-Dingell Bill

Too few physicians, we think, are sufficiently detached from the overwhelming burden of the day's work and evening meetings to interest themselves in research into world-wide movements which are now af-

[1] Annual Meeting Medical Society of the County of Westchester November 20, 1945, as reported in the *Westchester Medical Bulletin* 8. 7 (Dec.) 1945.

fecting the status of the medical profession both here and abroad It is the function of editorial staffs to collate available material bearing on this subject and to present it in as abbreviated form as possible in the hope that it will be noted and used in forming judgments and attitudes toward currently proposed changes in status of the profession We are possibly too much occupied with details and thereby miss the significance of the forces at work at the national and international levels Some of these forces have their roots in the revolt of the masses of the people against poverty, insecurity, and political tyranny, against bad working conditions, discrimination, exploitation, neglect, against disease as a cause of personal suffering and as an economic hazard Revolt against any of these conditions, which are common to all peoples in greater or less degree, has constantly occurred in the past but in a somewhat localized, restricted sense However, with the recent increase in industrialization of many nations, hastened in some cases by war, revolt has become simultaneous and additive The resultant stresses no longer involve isolated plants or communities but now whole industries, the political life of nations, and the destiny of all peoples of the earth

Medicine, touching all phases of human endeavor, all human life at one time or another, must necessarily be part of this revolt More and more the irresistible tide will touch and affect the professional and economic life of each physician The Congress and the people of the nation have thrown in their lot with the United Nations Organization and the establishment of a workable world government already is beginning to emerge To say that this trend in world affairs and our participation in it will leave the practice of medicine here or anywhere unchanged would be to ignore the prime role which medical science must play in the postwar world Starvation, systematic and deliberate wreckage of the health of millions of all nationalities will seriously affect the economy of many nations for generations to come

We are fortunate in the United States to have escaped the catastrophe that has been visited upon Europe and many other parts of the world Here there is time for considered, carefully planned change in methods for better distribution of medical care, for the creation of a demand for voluntary sickness insurance and the satisfaction of that demand, for higher quality medical service for war veterans, for expansion of teaching institutions, for more and better hospital facilities There is no reason why a rapid, ill-considered change in types of medical service *here* should be advocated by anyone

We can appreciate that in Europe, in Great Britain, in the Orient the urgency of necessity may be the governing factor in provoking more radical procedures, more violent reaction to intolerable living conditions In our own situation there seems to be little excuse for blindly plunging into government-controlled medical practice On the contrary, there exists every opportunity and facility in this nation for intelligent experimentation with and evolutionary development of a wide variety of medical service suited to the temperament and economy of the people

The President-Elect of the A.M.A.

At the recent meeting of the House of Delegates, Dr Harrison H Shoulders, of Nashville, Tennessee, was elected to this distinguished office, we desire to extend to him our felicitations and good wishes Dr Shoulders has served well as Speaker of the House for several years and has been a prominent member of the Tennessee State Society, of which he has been secretary and editor He has been an outstanding advocate of medical freedom and will continue in his new office the defense against the encroachments of government in the practice of the profession To accomplish these ends will prove a giant task, and we wish him God-speed

Postoperative Early Rising

Prolonged bed rest following surgical operations appears to be the latest of the many surgical traditions to be discarded and proved to be fallacious Early rising was first advocated in this country in 1899,[1] and in Europe it has been increasingly popular for several years, but it is only within the past few years that a large number of favorable reports have appeared in American medical literature It is significant that practically no unfavorable reports have been published.

To most surgeons it seems to be a radical departure from a well-established routine Older surgeons will recall the stubborn adherence to other routines, notably preoperative purgation, postoperative starvation, and drainage of the peritoneal cavity The proof of each of these fallacies was accepted reluctantly and only after the evidence was proved by experience to be irrefutable.

It is claimed that getting patients out of bed on the first few days after operation results in a lowering of pulmonary complications, prevention of thrombophlebitis, phlebothrombosis, and embolism, lessening of urinary retention, improvement in appetite and bowel function, higher morale, and shortened convalescence These claims appear to be substantiated by all of the statistics published in the past few years

Schafer and Dragstedt[2] have emphasized that early ambulation is not a substitute for but an adjunct to good surgical technic and proper preoperative and postoperative care They stress the importance of gentle handling of the tissues, accurate reconstruction of wounds, strict asepsis, adequate preoperative preparation, good anesthesia, decompression of the stomach and intestines, restoration and maintenance of fluid balance, and replacement of blood and plasma by transfusion

Other writers emphasize the importance of incision parallel to, instead of perpendicular to, the fibers of the aponeuroses This means the transverse incision for upper abdominal and pelvic operations and the McBurney incision for appendectomy Most authors advocate nonabsorbable sutures, but Schafer and Dragstedt used only catgut. Surgeons who prefer the time-saving use of continuous catgut sutures might well forget the slogan that nonabsorbable and absorbable sutures cannot be combined Interrupted cotton sutures to the anterior rectus sheath are a good insurance against the early absorption or slipping of catgut, and are an improvement on through-and-through tension sutures.

Current Editorial Comment

Writing in the *Journal of Milk Technology* for July–August, 1945, Dr Paul B Brooks says, editorially, of the role of the laboratory in milk sanitation

"Hanging, framed, in the office of the writer is a copy of an advertising circular sent out by a Philadelphia milk dealer, in 1880, to institutions in his city The undersigned dealer, it announced, was prepared to supply "hygienic milk," it having been "submitted to the Centrifugal Process" as soon as possible after being received from the farmers So thoroughly was it separated from the cream that "no portion of the cream remains in the milk" and by this means, it was announced, the milk was also "thoroughly cleansed, as the process removes a portion of offensive slime from all milk." "The advantages of the insuring of perfect cleanliness of the milk," the dealer wisely observed, "is too obvious to require comment" and he advised recipients of his circular who were "aware of the advantage of a diet of milk prepared as above described" to communicate their orders promptly

At about the time when this progressive milk distributor was considering that by removing the cream and "a portion of offensive slime" he was insuring the ' perfect cleanliness" of his product, bacteriologic work on milk was being undertaken for the first time Sedgewick, within a few years,

published a report of bacteriologic examinations of the Boston milk supply, apparently the first report of its kind, and Professor Conn, of Connecticut, another pioneer, was discussing the source of the bacteria found in market milk

Our present-day milk supplies are, as a whole, clean and safe to a degree which could scarcely have been foreseen at that early day The progress which this change represents, while it has not kept pace with the development of applicable scientific knowledge and has moved by devious routes, has after all been great Of the several factors involved in this progress, the one which quite certainly has contributed the most has been laboratory service

The trend toward modern milk sanitation got its start sixty-odd years ago when the dairy bacteriologists began the practical application of their new-found knowledge The objective then was to get the dirt out of milk and bacterial counts provided a tangible measure of cleanliness Some of the medical bacteriologists very soon recognized that it was pathogenic bacteria in milk which were most important But their limited knowledge of the relation of bacteria to disease found little practical application in milk sanitation

That progress in milk sanitation has been slow and devious is not difficult to explain Laboratory workers, being scientists, are conservative, disinclined to form and release new conclusions until the evidence is all in—as the evidence in scientific matters seldom is When they speak, their language usually is not that of the man in the field Even between the milk laboratories and the medical or clinical laboratories the liaison has not been as effective as it might have been There has been a largely unfilled need for not-too-scientific interpreters between the bacteriologists, immunologists, and epidemiologists, and the field workers in milk sanitation whose job it is to see that the findings of the scientists are applied in practice The present quite general lack of clear understanding of milk-borne hemolytic streptococcus infection, though the facts have been available for several years, is a case in point

In short, the laboratory, over the years, has developed and accumulated the fund of scientific knowledge upon which modern milk sanitation is largely based What is most needed now is more effective and complete translation into action of the applicable part of the accumulated knowledge When we have that we can move on to our ultimate goal—a goal already in sight"

German Measles and Congenital Malformations Among the many causes underlying the development of congenital malformation, increased attention is being centered on the occurrence in the early months of pregnancy of rubella, a virus disease, insofar as is known Unfortunately this infectious malady is rather common, not particularly serious in its manifestations, and usually not much attention is paid to the patient Yet within recent years well-substantiated reports have appeared which seem to show a definite connection between its occurrence and subsequent malformations The first of these emanated from Australia Thus, Gregg in 1941[1] noted 78 cases of congenital cataract in infants, 44 of whom also had congenital heart disease, whose mothers had had rubella in the early months of pregnancy Another Australian physician, Swan, found that of 25 pregnant women who developed rubella during the first two months, all gave birth to children with congenital defects usually of the eyes or of the heart If the mothers had the disease after the third month, the incidence was less, only about 13 per cent American observers have also noted this association, among them Reese[2] and Erickson [3] Two additional cases have been recently published by Adams[4] in which both cataracts and heart disease were found, the mothers having had the German measles during the fourth and sixth weeks

Now that attention has been drawn to the matter, reports of additional cases undoubtedly will be published The laity and most physicians do not regard this disease as serious It is not insofar as danger to life or aftereffects are concerned, but when we consider what may be the results if it involves the pregnant woman, every effort should be made to avoid exposure Perhaps the use of a prophylactic pooled adult convalescent serum, as suggested by Adams, may prove effective At any rate, the *laissez-faire* attitude toward the disease must be abandoned and isolation of affected individuals accomplished

The reason for the occurrence of these particular defects may be explained by the fact that the lens of the eye and the intraventricular septum of the heart are developed during the period between the fourth and the eighth week of fetal life and the embryonic tissues are particularly susceptible to virus infection The situation evidently demands further attention and a systematic investigation is called for

THE Rh FACTOR IN PREGNANCY AND ISOHEMOLYTIC DISEASE

RAYMOND J PIERI, B S , M D, and ROBERT C SCHWARTZ, A B , M D , Syracuse, New York

(From the Departments of Obstetrics and of Pediatrics, Syracuse University School of Medicine)

THE medical profession in general and even some of the laity, throughout much of the civilized world, now manifest an increasing interest in matters relating to the subject of this paper We are still far, however, from the achievement of universal alertness in this regard Science now knows that eternal vigilance concerning the role of the Rh factor in man may be the means of saving the lives of certain mothers, babies, and transfusion recipients Forbearance is solicited from those to whom the material in this paper is now hackneyed, in deference to those of our colleagues who, for perhaps many a sound reason, have not as yet become familiar with the principles of isoimmunization involved in this subject. For the common interest of all of us is the commonweal of humanity

Certain terms and synonyms frequently used by the hematologist concerning the properties of human blood cells and blood serum prove elusive to the memory of the practicing physician In Table 1 will be found the terminology and definitions familiarly employed in immunology and used in this presentation

The Blood Groups

Isoagglutination in man was first described by Landsteiner[1] (1901), who recognized a congenital difference between the agglutinogens (red cells, antigens) and agglutinins (serum, antibodies) found in different individuals of the human species. On the basis of isoagglutinins (causing agglutination) of the red corpuscles of man he and his pupils first described the four blood groups O, A, B, and AB, by which may be classified the blood of each human individual These groupings are hereditary according to Mendelian principles

Solely for purposes of graphic description the authors[2] in 1944 depicted each agglutinin (serum) and its corresponding agglutinogen factor (cells) as isomers or homologous images of each other, and portrayed them as such (Fig 1) Thus the A agglutinin is the specific antibody of its homologous image or counterpart, the A agglutinogen (antigen) Cells containing the A agglutinogen are promptly clumped in the presence of the A agglutinin Likewise B agglutinin is the specific antibody of B agglutinogen When both A and B exist together in the same specimen we may similarly represent them graphically (Fig 1) as AB Normally, of course, an agglutinin (serum) and its homologous agglutinogen (cells) do not exist in the same individual

Thus, a specimen of blood from an individual in group O (Fig 2) will be seen to be divisible into its cells, which contain no agglutinogen, and its serum, in which both A and B agglutinins exist together In the same manner (Fig 3) group A blood can be separated into its cells, which contain A agglutinogen, and its serum, which contains B agglutinin Group B blood is the reverse of group A (Fig 4), containing B agglutinogen in its cells and A agglutinin in its serum Group AB (Fig 5) is the reverse of group O, containing both A and B agglutinogen in its cells, while the serum contains no agglutinins

It is to be emphasized here that the cause of most blood transfusion reactions is dependent upon *agglutination of the donor's cells by the serum of the recipient*, due to the presence of specific isoagglutinin (antibody) in the latter It is always desirable, therefore, to use as a donor an individual who is in the identical blood group with that of the recipient Thus, however, is not invariably practicable Actually, the serum (isoagglutinin or antibody) of the donor becomes so diluted or inactivated by the circulation and tissues of the recipient that the agglutinating property (antibody) of the donor's serum (upon the agglutinogen in the recipient's cells) is relatively impotent Accordingly, the diagram shown in Fig 6 depicts the clumping effect upon cells (d nor) by the agglutinins of the various sera (recipient) From this chart it becomes apparent why group O is referred to as "universal donor" (cells without agglutinogen) while group AB is termed "universal recipient" (serum without agglutinin)

Other Blood Factors, or Types, and the Rh Factor

Certain other factors or agglutinogens (antigens) exist in the human red corpuscles of all four blood groups Such types may be diagrammatically represented (Fig 7) as M, N, MN (M and N), and P For these factors there have been found no corresponding or homologous isoagglutinins in human sera, and so far as is known they fail to produce human transfusion reactions It has been shown, however, that they do pro-

Presented by invitation at the Meeting of the Eighth District Branch, Medical Society of the State of New York, Hotel Statler Buffalo New York, October 4 1945

TABLE 1.—Terms, Synonyms, and Definitions

Terms	Synonym	Definition
Agglutination	Clumping	The result of a specific agglutinin acting upon its corresponding agglutinogen
Agglutinin (serum)	Antibody	The specific substance which causes clumping of its corresponding homologous agglutinogen (antigen)
Agglutinogen (cells)	Antigen	The agglutinable substance for which there is a specific antibody in the blood serum or which under proper conditions may stimulate the formation of such an antibody
Anti-Rh factor (serum)	Rh antibody	The specific substance which causes clumping or hemolysis of Rh positive red blood cells
Donor		One who furnishes blood for transfusions
Hemolysin		Any agent in the serum capable of destroying red blood cells
Heteroimmunization		The production of a specific antibody (agglutinin) in the serum of an individual of another species. Example—by injecting the red cells of one species into the blood of another animal
Isoagglutinin	Isoantibody	An agglutinin capable of agglutinating the agglutinogen (red cells) of another individual of the same species
Isohemolysin		A substance in the serum of a species capable of destroying the red cells of another of the same species
Isohemolysis		The destruction of the red cells by an isohemolysin
Isoimmunization		The production of a specific agglutinin or antibody in the serum of another individual of the same species
Recipient		One who receives anything (especially blood) in transfusions
Rh factor		An antigen present in the red cells of 85 per cent of humans. It may produce an Rh antibody if injected into another individual under certain conditions

duce corresponding agglutinins if the human red cells containing that particular type are injected into the circulation of some other animal, such as the rabbit (heteroimmunization)

In 1940 Landsteiner and Wiener[3] injected blood from the Macacus rhesus monkey into rabbits, thus developing agglutinins in the rabbits' serum which clumped the red cells of the monkey. They also observed that this same rabbit serum (agglutinin) clumps not only the red cells of the monkey but also the red cells of about 85 per cent of humans.

The red cells of the remaining 15 per cent of humans show no evidence of clumping by the antimonkey agglutinins. Obviously this (15 per cent) group of human individuals have in their red cells none of the agglutinogen (antigen) factor which is present in the Macacus rhesus cells and in the cells of 85 per cent of humans. This particular agglutinogen is referred to as the *Rh factor* (Fig. 7). Individuals whose cells contain this antigen (85 per cent of the random population) are termed Rh positive (Rh+). Those individuals whose erythrocytes do not contain the antigen (15 per cent of the random population) are termed Rh negative (Rh−). The percentage of incidence of Rh-positive individuals is higher in the colored races than that in the white race. The Rh factor is also transmitted to offspring as a Mendelian dominant character.

It has been rather definitely established that the Rh antigen may be divided into three subtypes,[4] called Rh_0 and Rh_1 and Rh_2. Another agglutinogen, called the Hr antigen, may be present in the cells of any individual, whether Rh positive or Rh negative, and rarely may also be responsible for isohemolytic reactions. For the purposes of this paper, however, and because the standard anti-Rh agglutinin (containing anti-Rh_0, anti-Rh_1, and anti-Rh_2) is responsible for most intragroup incompatibility or isohemolytic reactions we shall omit consideration of the anti-Hr agglutinin from this presentation.

The Rh Factor and Isoimmunization

Experience in both military and civilian practice has shown that Rh-negative individuals, when transfused with Rh-positive blood (agglutinogen), even of the same blood group, may insidiously develop in their (recipient's) serum anti-Rh antibodies (isoimmunization). The production of such anti-Rh antibodies is variable in degree. In a subsequent transfusion of Rh-positive blood of the same group into the same recipient these antibodies (anti-Rh agglutinins) produced in the recipient by the earlier transfusion of Rh-positive blood, tend to cause agglutination and destruction of the Rh-positive cells of the donor. Such an intragroup transfusion reaction may be severe enough to cause death.

The prevention of this accident lies in the employment, in these cases of subsequent transfusions, of blood from an Rh-negative donor of the proper blood group *who has not previously been immunized*, i.e., an Rh-negative donor who has not upon some previous occasion been the recipient of Rh-positive blood.

The Rh Factor and Isohemolytic Disease

Clinically most cases of so-called erythroblastosis fetalis (acute hemolytic anemia) are recognized in the newborn as either universal edema (hydrops), or as icterus gravis (jaundice), or as a marked congenital anemia. The condition is usually apparent at birth or within a few hours or days thereafter. The predominant findings in a typical instance are those of blood destruction and liver involvement, accompanied

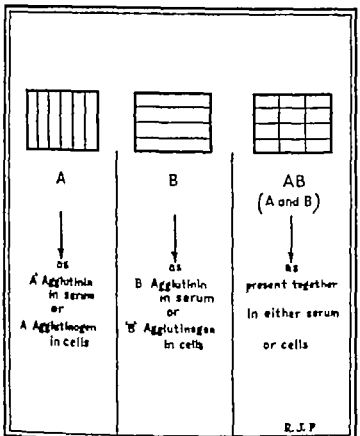

FIG. 1 Authors' concept of agglutinins and agglutinogens as homologues of each other

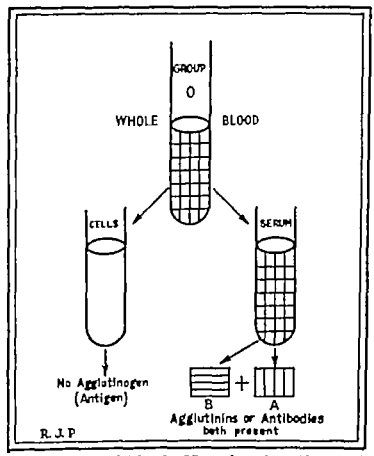

FIG. 2. Group O blood. Note that the cells contain no A or B agglutinogens (universal donor)

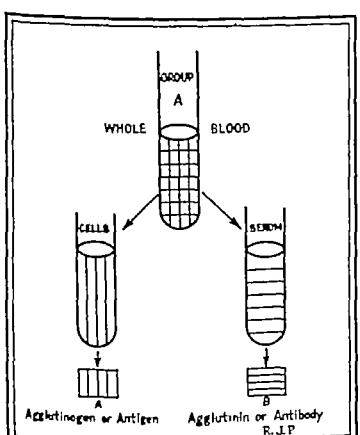

FIG 3. Group A blood contains A agglutinogen in its cells and B agglutinin in its serum (the reverse of group B)

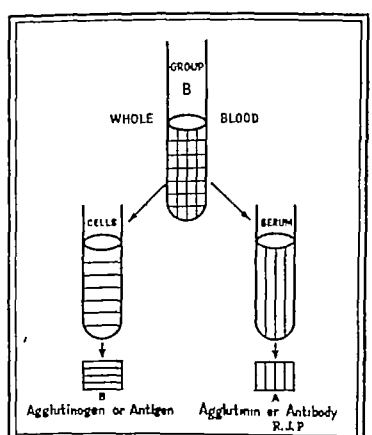

FIG 4. Group B blood contains B agglutinogen in its cells and A agglutinin in its serum (the reverse of group A)

by microscopic evidence of blood regeneration The mortality rate varies from 50 to 100 per cent.

Recently Levine[4] and his associates have shown that about 90 per cent of these infants have in their blood cells the Rh factor, inherited from the Rh-positive father The mother lacks this factor in her blood cells (Rh negative) The blood destruction observed in the neonate is held to be dependent upon the presence in the baby's serum of a specific Rh antibody (the anti Rh agglutinin

TABLE 1.—Terms, Synonyms, and Definitions

The condition is usually apparent at birth or within a few hours or days thereafter. The predominant findings in a typical instance are those of blood destruction and liver involvement, accompanied

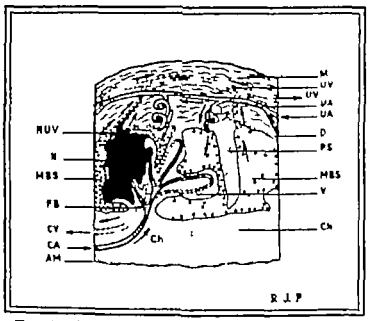

FIG 9 Diagrammatic illustration of rupture of placental villus. N, fetal blood from villus vessels pouring into maternal blood sinus MBS Fetal blood enters maternal uterine vein at NUV to gain access to general circulation of the mother (see text)

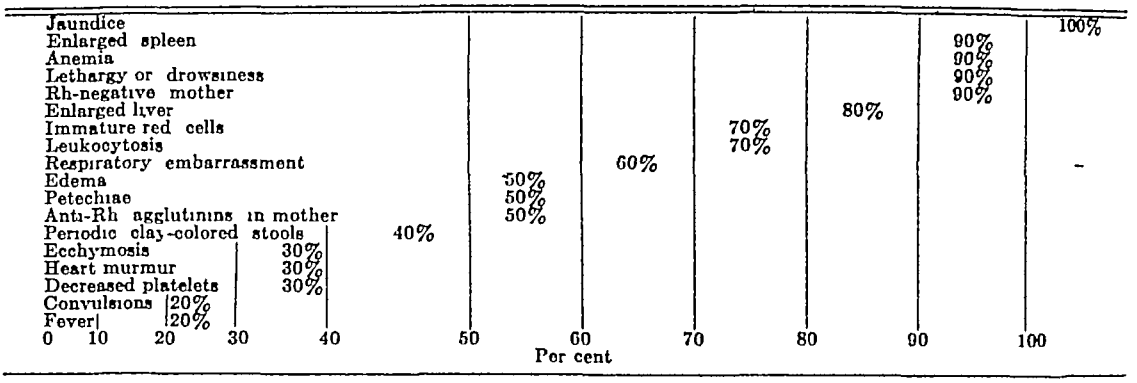
ingestion of certain drugs (sulfonamides, quinine) or poisons (arsenic, phosphorus), acute infectious anemia (Lederer's anemia), sickle-cell anemia, or other unrelated diseases None of these conditions, although sometimes clinically almost identical, and sometimes associated with hemolysis, may be said to be due to *isohemolysis*

In true isohemolytic disease, paradoxic as it seems, there exists in the body an antigen *simultaneously with its specific agglutinin* or antibody

The suggestion is therefore pertinent for a change of terminology from erythroblastosis fetalis to *isohemolytic disease* as an accurate designation of that hemolysis which is observed as a result of antigen-antibody reaction It is in this sense that the term isohemolytic disease is used in this presentation In time as investigation continues, other isohemolysins unrelated to the Rh factor, will doubtless be recognized Indeed, Polaves[18] has already observed evidence of this in the cases of two Rh positive mothers both of whom belonged to group O Both newborns belonged to group A Isoimmunization was observed in both babies as a result of unusually high titer of A agglutinin present in the serum of each of the mothers

Mechanism of Production of Anti Rh Agglutinin

It is our concept [2] and that of other observers,[11, 12] that the mechanism of production of the Rh positive antibody is based upon events which occur within the placenta itself



The medium (Fig 8) for the interchange of gases, water, and nourishment between mother and baby is the fragile wall of the placental villus, V, a trophoblastic projection of the chorion frondosum itself, Ch Through an arteriole, FB, each villus is supplied with fetal blood by a branch from one of the umbilical arteries, CA, while a corresponding venule VV, eventually returns the blood to the fetal circulation, CV The delicate placental vilh are bathed in pools of maternal blood, MBS, in the intervillus spaces The maternal blood is carried to these spaces by minute branches of the uterine artery, UA, which are usually found in relation to the decidual septa, PS, while corresponding veins return it eventually to branches, UV, of the uterine vein Constant circulation is assisted by the uterine contractions which occur at intervals throughout every pregnancy Normally, the blood of the child circulates inside the villus, while the maternal blood circulates outside this delicate structure The relationship is so close that osmosis readily takes place through the villus wall It has been estimated that if all the vilh of a placenta at full term were placed end to end their combined length would exceed 11 miles [13]

That the placenta is extremely susceptible to the effects of tumors, trauma, and disease has long been known Thus is not a surprising observation, in view of the complex structure and function of this organ, and of the fact that the more complex an organ the more delicate and vulnerable to injury it becomes [14] Careful scrutiny of the placenta[15] will reveal in nearly every instance the unmistakable evidences of one or many areas of old or recent pathologic alteration Such scars, varying in size from pinhead to several cm , have been designated by a confusion of terms, such as infarction, hepatization placentitis, necroses apoplexy, etc Actually, each such scar represents merely the evidence of a previous placental injury

Since the most delicate portion of the placenta (chorion frondosum) is the villus itself, this structure is the most susceptible to injury (rupture), either as a result of apoplexy, or of hemorrhagic infarction, or of direct trauma Whatever the causative factor, any violent break in the continuity of the vessels of one or more villi will result in hemorrhage of fetal blood cells (Fig 9, N) into the maternal circulation, MBS From here the fetal blood elements, NUV, are carried into the uterine vein, UV, and thence into the general circulation of the mother Such a hemorrhage may be minute and apparently insignificant, or of considerable size Either may produce most serious sequelae

If the baby's cells contain the Rh antigen (Rh positive), while those of the mother are without the antigen (Rh negative), a variable degree of isoimmunization is inevitable The Rh positive cells of the baby stimulate mothe

TABLE 2.—Showing Essential Symptoms and Signs of Isohemolytic Disease and their Approximate Percentages of Frequency

the Rh-negative mother the specific anti-Rh antibody (anti-Rh agglutinin) This antibody not only becomes present in the blood serum of the mother but is readily transmissible, as are many toxins and antitoxins, through the placental filter (the walls of the villi) into the circulation of the infant in utero It is the action of this antibody upon the Rh-positive cells of the baby which produces the disease entity which in about 90 per cent of the cases we recognize as isohemolytic disease In most of the remaining 10 per cent the disease apparently depends upon similar genetically related antigens (such as those designated as Hr or even the A and B antigens), present in the baby's cells but absent in those of the mother

Diagnostic Features

The earlier the diagnosis is made and appropriate treatment instituted the better becomes the prognosis Routine Rh determination in all pregnancies is ideal If, in any expectant mother, the history reveals a reaction to any former blood transfusion, or an unexplained spontaneous abortion, miscarriage, or stillborn infant (especially if her first baby was normal) one's suspicion should be aroused as to the possibility of isoimmunization The history of the birth of an anemic, jaundiced, or edematous infant, or a combination of any of these, is presumptive evidence of this condition After viability, in a positive case, premature termination of pregnancy should be seriously considered, especially if the antibody concentration increases During labor a bile-stained or amber-colored amniotic fluid, with or without signs of fetal distress, should place the accoucheur on guard, and indicate to him the necessity for immediate Rh-factor determinations upon the mother, and upon the baby (cord blood) as soon as delivery occurs

In any newborn baby exhibiting anemia, increasing jaundice, edema (hydrops), enlarged liver and spleen, with a blood smear showing evidence of erythroblastemia, not always manifest, one must rule out isoimmunization Some additional features which we have noted in a number of our cases, usually within the first twenty-four to forty-eight hours, are lethargy, sometimes alternating with convulsions, dark amber urine, diffuse or localized petechiae, unexplained fever, and an abnormally low platelet count (Table 2)

The differential diagnosis between true isohemolytic disease and other unrelated causes of hemolytic reactions must here be critically considered (*vide supra*) Unrelated and rarer causes of jaundice and/or anemia must be ruled out Among these are such conditions as congenital atresia of the bile ducts, certain liver, gastrointestinal, and cardiac deformities, neonatal nephritis or nephrosis, hemorrhagic disease or true hemorrhage, and the still more rare blood dyscrasias of the neonate

Discovery of the anti-Rh agglutinin in the mother's serum during pregnancy, labor, or after delivery is evidence of an antibody antigen reaction A rise in titer (concentration) of this agglutinin during pregnancy is more incontrovertible When the serum of a suspected Rh-negative mother yields in vitro no evidence of anti-Rh agglutinin the so-called biologic test may be employed This consists of injecting 50 cc of Rh-positive blood into her circulation,[16] Usually within an hour or less this will cause a reaction (chills, fever, hemolysis) which may be considered *proof of the condition*

Management

Usually the first Rh-positive child of an Rh-negative mother and an Rh-positive father will survive (insufficient or undeveloped antibody?) Subsequent pregnancies may result in abortion or miscarriage, or the child near term may succumb to the disease in utero and be stillborn, or survive the ordeal of labor only to expire within a few hours or days from the effects of the disease An Rh-negative baby, of course, is unaffected

The oxygen tent and immediate transfusion of 60 cc of whole blood from an Rh-negative donor, repeated at forty-eight-hour intervals during the first two weeks of life, offer the best prognosis The employment of father's blood for transfusion is contraindicated (Rh positive cells) So is the use of mother's blood (Rh antibodies) unless, as recommended by Falkenstein,[17] her donation of cells is first washed free from plasma (antibody) and then given intravenously as a suspension of mother's cells in normal saline. It is our custom to add to the above therapy adequate amounts of C and K vitamins as prophylaxis against possible cerebral complications Milk from the mother probably should not be given the baby (Rh antibodies) Usually about two weeks are required before the anti Rh substance becomes eliminated from the baby's circulation

As in any other obstetric case, an Rh negative mother may herself require transfusion In this event it must be emphasized that she receive Rh-negative blood

Blood Grouping Tests

Blood grouping, or typing, is essential before every transfusion A drop of known group-A serum is mixed on a glass slide (ordinary room temperature) with a drop of 1 to 2 per cent saline suspension of the cells to be tested To another drop of such cells a similar amount of group-B serum is added Microscopic examination is made twenty to thirty minutes later If no agglutination occurs with either serum, the cells belong to group O Agglutination by A serum signifies that the cells are those of group B Agglutination by B serum means the individual belongs to group A. If both sera cause agglutination the cells are those of group AB (Fig 6)

Ideally, all prospective donors and recipients and all expectant mothers should be tested for the Rh factor This determination is especially important in patients who have received one or more previous transfusions, and in women who give a history of toxemia, miscarriage, or stillborn or isohemolytic children All available relatives of known Rh-negative persons should be tested, since it is known that in these individuals a greater percentage of Rh-negative persons will be found than among the relatives of those who are Rh-positive

By using known anti-Rh serum the testing process is simple It is important here to bear in mind, however, that the anti-Rh antibody is a "warm" agglutinin That is, the agglutinin or antibody is most effective at body temperature 37.5 C Variations of this temperature definitely interfere with the test

In our laboratory[18] the following steps in the technic are now employed

1 One drop of the blood to be tested is placed in 1 cc of normal saline (approximately a 2 per cent suspension)

2 One drop of known anti Rh serum is placed at the bottom of a serology test tube (3 by ⅜ inches)

3 One drop of the 2 per cent suspension of red cells is added directly to the drop of anti Rh serum in the testing tube, which is then incubated for fifteen to sixty minutes at 37.5 C The duration of incubation depends upon the titer or concentration of the anti-Rh serum

4 The testing tube is next centrifuged for several minutes

5 The tube is then inspected for the presence of macroscopic clumping (agitate gently)

6 If clumping is present the cells are Rh-positive cells A hanging-drop preparation under the microscope will confirm the presence (Rh-positive) or absence (Rh negative) of clumping

7 If no clumping is observed another drop of the anti Rh serum is added to what is left of the centrifuged specimen in the testing tube This is returned to the incubator for another interval, then recentrifuged and re-examined If no microscopic clumping is observed the cells are definitely considered Rh negative It is good technic to run a known specimen of Rh-positive cells as a control during the test

Rh testing sera should be of high anti-Rh titer Blood from a recently delivered Rh-negative mother who has given birth to a baby with isohemolytic disease usually possesses agglutinin of high titer This titer, however, rapidly deteriorates and often, after a few months, may have entirely disappeared *

Summary

1 Every physician who performs blood transfusions, or who has under his care expectant mothers or newborn babies, should be thoroughly familiar with the fundamentals concerning the blood groups and isoimmunization

2 The blood groups are graphically illustrated and explained

3 Other blood factors, especially the Rh factor, are graphically illustrated and the special importance of the latter in practice is emphasized

4 The relation between the Rh factor, transfusion reactions, maternal isoimmunization, and isohemolytic disease is presented, with illustrations of the placental mechanism involved during certain pregnancies

*The Blood Grouping Laboratory at Boston, Massachusetts under the direction of Dr Louis K. Diamond,[19] is engaged in the study and concentration of anti-Rh sera, and solicits specimens of blood for study Specimens thus submitted to this laboratory will be concentrated and a portion returned to the sender

5 The diagnosis and proper management of isohemolytic disease and of the Rh-positive isoimmunized patient are outlined

6 A simple technic for accurate Rh testing is included with that for the ordinary procedure for blood grouping

ENCOURAGING TRENDS IN CANCER MORTALITY

The outlook for the control of cancer is definitely promising There is growing evidence that cancer patients are seeking medical care earlier in the course of the disease and that their chances of survival have improved materially * Encouraging, too, are the facts regarding the trend of the cancer death rate among the many millions of Metropolitan industrial policyholders, who are a representative sample of the urban populations of the United States and Canada Among white female policy holders (ages 1 to 74), the death rate from cancer, adjusted to discount the effect of the aging of the group, has been quite generally downward for about a third of a century, among insured white males the mortality from the disease until very recently had been increasing, although at a diminishing rate, but in the past few years it has also tended downward

Even more impressive are the facts regarding specific sites, or locations, of the disease The age-adjusted death rate from cancer of the skin, for example, has been declining for about twenty-five years, during which period the mortality among white policyholders has been cut in half Almost as marked a decrease is recorded for cancers of the buccal cavity, where the relative decline seems to have been accelerated in the past decade Far more important, in terms of the number of lives involved, has been the long-term decline in the mortality from cancer of the female genital organs, the leading site of the disease among women The death rate from cancer of these organs has decreased by almost one fifth among white female policyholders in the past third of a century

The favorable experience for the sites just mentioned is presumably the combined result of a decrease in the incidence of the disease and a reduction in its fatality because of modern therapy—surgical and radiological The mortality from cancers of the stomach and liver has also shown a marked decline, but it is likely that a considerable part of this decrease is spurious These organs are frequently the site of a secondary cancer involvement, and as reporting has improved in accuracy, the primary site, such as the breast, has been recorded more often on the death certificate Similarly, because of more accurate diagnosis, it is probable that an increasing number of deaths, instead of being attributed to cancers of the stomach and liver, have been reported as due to cancer of the intestines. Thus the upward trend in the death rate from cancer of the breast and from cancers of the peritoneum, intestines, and rectum which was noted until recently, undoubtedly has been the result, in part or in whole, of better diagnosis and reporting In the past few years, however, even these sites have shown a slight decrease in mortality What gives added significance to this improvement is the fact that, at the same time, cancers of the stomach and liver have recorded relatively large decreases

The death rates from cancers of the bladder and of the prostate, which for many years had moved steadily upward among white male policyholders, have also in recent years shown a slight downward tendency

The only important site to record an uninterrupted rise in mortality is the lungs and pleura, and even here the rate of increase is slowing down. The striking increases in death rate for this site must be interpreted with caution, however, inasmuch as many cases which would have gone unrecognized years ago are being correctly diagnosed and reported as hospitalization, operation, and autopsy become more common It should be remembered that only about a decade ago cancer of the lung was considered a hopeless affliction, whereas now clinical reports show considerable success in the treatment of the disease

Altogether, the recent trends in cancer mortality are encouraging, and there is reason to believe that real gains are being made It is very likely that further progress will be achieved by advances in medical and surgical treatment and through discoveries in scientific research But even in the present state of knowledge and medical practice, many thousands of lives could be saved annually by earlier diagnosis and treatment Cancer control is a major challenge not only to the medical profession but to the lay public as well —*Statistical Bulletin, July, 1945*

COMMENTS ON WAR NEUROSES

NORMAN A LEVY, M.D *, Los Angeles, California

THE subject of the war neuroses has received considerable publicity in the press, the popular magazines, and the medical literature It would be well, nevertheless, that we understand the meaning of the term "war neurosis" The word "war" usually implies fighting, mutilation, death, and destruction, certainly the most horrible and tragic aspect of war For every individual in the armed forces, however, "war" consists of everything he experiences during his military service from the day he leaves home for the induction center to the day he returns home as a veteran It is in this latter sense that I use the word "war," for our experiences have taught us that not only actual combat experiences but many other factors in military service play a role in producing neurotic reactions

What do we mean by "neurosis"? This is a label we apply to those forms of behavior, using the word behavior in its broadest sense to include all levels of psychobiologic activity as well as the behavior of the whole individual, which appreciably interfere with the individual's successful adaptation to the world around him Removal from the normal life of the civilian to the abnormal life of military service entails psychologic adaptations without which the individual would not be able to function effectively The dysfunction might manifest itself as a disturbance in the general behavior and effectiveness of the individual so that he could not meet the demands of the current situation or in disturbances at the physiologic level with the production of physical symptoms Regardless of the clinical manifestations, these disturbances result from a failure of the adaptive mechanisms and can be classified, for descriptive purposes, as neuroses It is obvious, however, that the external environment of war is an abnormal one, that it involves varying intensities of stress, especially in combat with its repeated threats to life and safety, far beyond those of normal living Many authorities therefore feel that it is unwise to label as neuroses the psychobiologic disturbances which occur in previously well-adjusted, stable men, when they can no longer tolerate and adapt themselves to the severe stresses and harrowing experiences of modern warfare For this reason the nonstigmatic terms, "operational or combat fatigue" and "anxiety or stress reaction," have been used The terms "anxiety reaction" or "stress reaction" are scientifically preferable to "combat or operational fatigue," as the latter unduly emphasizes the role of physical fatigue and exhaustion, while the former rightly emphasize the importance of stress and anxiety in these conditions

Now that the war is over and demobilization has begun, civilian physicians will be consulted by many veterans, some of whom will have been discharged from the service for medical disabilities, others through the ordinary administrative procedures Few of your patients will be seriously incapacitated They will be going about their lives just as you and I, but they will be suffering with various functional symptoms They will not need hospitalization, and will not be able to find adequate help from existing veterans' outpatient facilities. Specialized psychiatric treatment, psychotherapy, will not be available in most communities, because of the paucity of trained psychiatrists The care of these men will fall, therefore, on the shoulders of the private practioners To deal with these functional disturbances it is of primary importance that physicians be aware of and on the alert to detect the influence of strong emotions and emotional conflicts on the functioning of man and his body

With this in mind, I would like to present the more important emotional conflicts observed in our work as military psychiatrists This is important, for the returning veteran takes back to civilian life not the personality with which he entered the service two to four years ago, but that of a man who has gone through many unusual and sometimes severely disturbing experiences The impact of these experiences has had, in many instances, a beneficent effect and have resulted in a maturing of the personality in the direction of greater independence, self reliance, and self-confidence We need not concern ourselves with these more fortunate men Our concern will be with the men whose war experiences were too traumatic for them, so that a certain amount of crippling of the personality resulted, retarding the normal process of maturing, or actually causing some regression

The crux of adjustment in war,[1] especially in the combat situation, is the individual's capacity to deal with the anxieties that are inevitably stimulated by exposure to severe frustrations and dangers Combat with its constant threat to life and limb, tremendously outweighs all other stresses Fear is the normal biologic reaction

Presented by invitation at the Thirty-Ninth annual meeting of the Fourth District Branch of the Medical Society of the State of New York, Glens Falls, September 21 1945

* Formerly Major Medical Corps, Army Air Forces.

[1] Levy Norman A.: Personality Disturbances in Combat Flyers, the Josiah Macy Jr Foundation, 1945.

which keeps the combat soldier constantly alerted so that he may effectively cope with the dangers confronting him He cannot flee from the anxiety-producing combat situation, as military discipline and his own inner drives and motivations will not permit it The strongest instinctual need and striving in human beings is for safety and security, but the combat soldier must thwart his intense desire to flee and must force himself to remain in the danger situation He is able to do so as long as his defenses against anxiety operate successfully As his defenses weaken, the anxiety-controlling mechanisms break down, anxiety begins to flood the personality, and the symptoms of an anxiety state become clinically manifest

The individual's capacity to defend against anxiety may be strengthened or weakened by a variety of influences It is weakened especially by severely harrowing, catastrophic battle experiences, "close shaves," such as crash landings, being shot down, bailing out, ditching in the sea, being wounded, witnessing the death and mutilation of close friends, becoming a prisoner of war, etc Physical fatigue, exhaustion, and illness are important factors in the reaction of ground-force troops who are subjected to gruelling physical hardships and deprivations Whatever promotes good morale strengthens and whatever produces poor morale weakens the anxiety-controlling mechanisms

The most common, almost stereotyped clinical picture in the combat zone was the typical anxiety state The symptoms were excessive anxiety, exaggerated fear, tension, restlessness, irritability, loss of desire to fly, phobic attitude toward flying, startle reaction, various physiologic autonomic disturbances associated with anxiety such as excessive sweating, tremors, tachycardia, gastric disturbances, frequency of urination, poor sleep, battle dreams and nightmares, poor appetite, loss of weight, excessive smoking, and alcoholic indulgence Depression, which was almost always present, was frequently due to the strong feelings of guilt and shame with which the men reacted to this failure to complete the expected operational tour

The anxiety did not freely erupt in all cases In a small percentage the anxiety remained repressed and was converted into hysteric somatic symptoms In other cases, the anxiety was chronically channelled through the autonomic nervous system to produce psychosomatic disorders, chiefly gastrointestinal illnesses and headaches

The dramatic nature of the stress endured by combat men makes it relatively easy to understand their intense emotional disturbances It must be remembered, however, that the noncombatant soldier, the Air Force ground echelon, and the rear echelon and supporting troops of the ground forces, have also been subjected to severe stresses, although different qualitatively and quantitatively These stresses consist, for the most part, of the severe emotional frustrations and deprivations of prolonged overseas service. This is seen in men who have been stationed for long periods of time on isolated Pacific islands or on bases in foreign countries where living conditions have been primitive and opportunities for satisfactory social and sexual life, recreation, and other gratifications are lacking In some instances the hazards of being bombed and strafed have been additional burdens Above all, the thwarting of the need for love and of the dependent needs present in all of us, especially the adolescent, has led in many instances to an accumulation and intensification of these needs As a result, the men, sometimes consciously but more often unconsciously, felt deserted and abandoned, not only by the Army but also by their own loved ones Often the reaction has been depression, resentment, and bitterness In some the intense emotional conflict resulted in the typical anxiety state described above

When I served as the neuropsychiatrist with the Air Forces in the North African and Mediterranean theater of operations, I saw hundreds of cases of combat anxiety states Relief from combat and return to continental United States was carried out in many as the first step in therapy Most of us thought that these anxiety states would subside by themselves without further treatment It was not until I had returned home and had the opportunity to study these war neuroses in the Air Force convalescent hospitals in this country that I realized how naively optimistic we had been Although many men recovered and could be reassigned, large numbers were found unfit for reassignment even after their furloughs and periods in rest camps Surprisingly, many combat crew members who had successfully completed a tour of combat duty developed nervous reactions after return home, many during their furloughs, others on reporting to redistribution stations for processing and reassignment, and still others after reassignment to continental bases Similarly, it has been found that nervous disturbances continue or develop in noncombatant personnel after rotation home

Our work with returnees and that of others, especially Grinker and Spiegel (*Men under Stress*, Blakiston, 1945), have given us at least a partial understanding of the emotional reactions responsible for these personality disturbances In the combat crew members a continuation of anxiety and its attendant symptoms commonly occurs even though the individual is no longer in a

dangerous situation He continues to react to external stimuli as though he were still alerted for an attack. It seems as though there has been an impairment of the ego's power to discriminate adequately between threatening and innocuous stimuli from the outer world Psychologic study of some of our patients indicates that exposure to severe anxiety-producing situations, as in combat, may reactivate previously existing but successfully repressed and controlled, deeply rooted anxieties due to childhood experiences Defenses built up in the normal process of maturing may break down and then not be quickly reconstructed These cases are characterized chiefly by anxiety, apprehensiveness, tension, and various concomitant physiologic disturbances. In formerly well-adjusted young men, a personality change is now noted They are cautious, and have a constant fear of and expectation of catastrophe, something bad happening, of getting hurt Those neurotic fears which existed prior to the war are now intensified These anxieties are projected on to all the various possible sources of danger in everyday life

Why is it that the individual's ego, after removal from the dangerous combat situation and return to the U.S.A., is no longer able to master anxiety? Why is it that this individual now has difficulty adjusting to what should be a safer, less frustrating life in the States? Our observations indicate that a change has occurred in the strength and maturity of the personality Apparently some regression has taken place While in combat, all the resources of the soldier's ego are utilized to combat anxiety so that the soldier can continue to function Loyalty to the combat unit, sense of duty and responsibility, pride and self respect, identification with the unit, and the wish to preserve the love and respect of comrades all force the man to continue in the hazardous combat situation. The normal urge for security, safety, and protection must be and is thwarted Naturally, this need accumulates and becomes greatly intensified, far beyond what is normal in an adult We know from previous observations in civilian life that when an individual is faced with painful frustrations, unbearable conflict, and anxiety, he understandably strives to find relief by regressing to a level of feeling and behavior in which he was free of anxiety Such a situation existed in childhood when passive dependence on loving parents provided protection, security, love, and other gratifications We are not surprised that strong, dependent needs and cravings develop in men who have been exposed to severe dangers and have felt intensely frightened and insecure These dependent needs had been partially gratified in the close personal relationships of the combat unit, but were all too frequently violently disrupted by the death and departure of close comrades and loss of leaders, greatly intensifying the individual's feeling of being alone and abandoned No wonder then, that the men are sustained in battle by the ever present wish and fantasy of "getting it over with," of "getting my missions finished and getting home," or that the deprived, frustrated soldier separated from his home for several years should long with his entire being for the gratifications which have been denied him so long

Finally, the great day comes and the man leaves the combat theater and returns to the States In many instances the struggle against anxiety and against the regressive dependent needs is given up It is no longer necessary, the battle is over Gratification lies ahead Unfortunately, reality cannot satisfy the tremendously powerful unconscious cravings for love, attention, and dependence which exist in many returnees, as such gratifications can only be given to small children Despite the gratifications given to most returnees by their families and friends, intense feelings of frustration often occur, followed by resentment and hostility The men feel that the people at home have changed and that their families are different In actuality the men have changed Their needs to be cared for and indulged, in order to feel secure and loved, are so great that they cannot tolerate even minor frustrations without reacting with resentment, like spoiled children When actual frustration and rejection is encountered, such as faithless wives and sweethearts, demanding or ununderstanding families, the reactions are naturally more severe The men are usually not aware of these child-like cravings, as they are not acceptable consciously to the grown-up part of the personality However, the inability to accept new responsibilities, the excessively angry reactions to trivial and minor annoyances, the dislike of routine military and family demands, the intense need and demand for indulgence are clearly indicative of the underlying emotional regression These immature attitudes come into conflict not only with the individual's own ideals and conscience, but also with the external environment, and cannot be adequately released in action or words As a result, much inner conflict develops, resulting in the tension, anxiety, and other psychogenic disturbances seen in our patients Many men feel quite upset and disturbed at the mysterious changes in themselves. They frequently feel ashamed and guilty because of their childlike attitudes and actions The feelings of insecurity, helplessness, and dependency rob them of their normal self-confidence and their feelings of inde-

out the tremendous need for outpatient facilities for the treatment of veterans with nervous disorders

Just as after the last war, large numbers of soldiers are returning to civilian life with personalities warped and distorted by some of the emotional disturbances just described Thousands more, free of overt neurotic disturbances at the time of discharge from the Army, will carry within themselves similar emotional tendencies in latent form The thinking person cannot avoid feeling concerned, not only about the tremendous medical problem, but also by the potential sociologic and political implications What is going to happen to these thousands, in fact, millions of veterans, many of whom have developed the dependent, demanding attitudes, the feelings of grievance, the intolerance of frustration, and the hostilities so typically seen in the war neuroses? Are our social, political, and economic institutions cognizant of and prepared to deal effectively with this problem? If life deals kindly with these men, if our economic and social system functions well and permits them to find adequate employment, security, and happiness, they should, for the most part, become effective and constructive citizens One can justifiably expect serious trouble if, on the other hand, this country encounters serious economic difficulties with unemployment and all the severe frustrations which inevitably follow Because of the prevalence of regressed dependent tendencies in many of our veterans they will, in the face of frustration and insecurity, readily turn toward demagogic leaders who offer them the dubious salvation of an authoritarian regime Just as they direct their hostilities toward the present authorities, the Army and its officers, when they feel frustrated, insecure, and abandoned, so later they will direct their grievances against our civilian democratic leaders It is a matter of history that the Fascist virus of postwar Europe found fertile soil in the disgruntled, frustrated veterans of World War I A similar virulent infection can be avoided by us only if we understand the emotional as well as the realistic economic and social problems of our veterans, and purposively take necessary prophylactic measures It is beyond our role and our knowledge as physicians to postulate what these measures should be That is a problem for economists, social scientists, educators, and for our business and governmental agencies We, as physicians, will be fully occupied with the vast numbers of veterans afflicted with emotional disturbances and functional symptoms It will be our obligation to achieve an adequate understanding of these neuroses and to develop therapeutic technics and facilities to cope with this manifestly difficult and challenging problem

3355 Wilshire Boulevard

"DOCTOR JONES" SAYS—

Alcoholism—that's the monthly bulletin of the Research Council on Problems of Alcohol I was looking over one of the recent issues and it's got a lot of interesting stuff in it

Doctor Jellinek, the head of the Yale alcohol studies—there's some figures quoted from an article he wrote They estimate there's a hundred million persons of "drinking age" (15 and over) in the United States And about half of 'em use alcoholic beverages to some extent About three million that use 'em become excessive drinkers and about 750,000 of these get to be chronic alcoholics In short, about one in each 33 of the "drinking age" population gets to be an excessive drinker and one in 134 a chronic alcoholic

That gives a pretty fair idea of the extent of the problem It's one society, as we call it, has been hammering at for hundreds of years without making much headway I'm glad to see 'em, now, going at it scientifically The main questions, of course, are why some people can't drink without overdoing it and the best ways of preventing 'em from becoming alcoholics or helping 'em if they do

Connecticut, I see, is establishing a board to study the alcohol problem and provide for the care and treatment of inebriates Nine per cent of their liquor license money is being set aside for their use Alabama is setting up a Commission "to prepare and administer a program for the rehabilitation of alcoholics and the education of the public with respect to dealing with alcoholism as a disease" In Massachusetts a special commission to study the problem has just made a long report And out in Buffalo the Council of Social Agencies is establishing a clinic for alcoholics

Alcoholics Anonymous—2,500 members, from all over the country, met in Cleveland this past summer to celebrate their tenth anniversary And there's other items about what they're doing in various places

Yes, sir Things are stirring in the alcohol line and it ain't just cocktail shakers Folks are coming to recognize that it's a health and not a moral problem And it's like world peace when the interested parties can agree on the general principles of a program—they can't expect perfection but there's hope of getting somewhere—*Paul B Brooks, M.D , in Health News, Dec 24, 1945*

COLLOIDAL SULFUR

Some Pharmacodynamic Considerations and their Therapeutic Application in "Seborrheic Dermatoses"

FRANK C COMBES, M D , New York City

(From the Department of Dermatology and Syphilology, New York University College of Medicine and the Third N Y U Medical Division, Bellevue Hospital)

SULFUR, which is an important constituent of all organic tissue and one of the most important elements contained in the human skin, has for centuries been a medical and veterinary standby for treatment of cutaneous disease. It has been used in many forms from the sulfur vivum of Pliny and Virgil to the colloidal sulfur of modern medicine It has been applied topically not only in its elemental state, but as a powder, and in ointments, lotions, and varnishes, as well as in the form of alkaline sulfides, such as sulfureted potash, Vleminckx's solution, etc

In more recent years, sulfur in colloidal form, sufficiently stable to be of more than mere scientific interest, has been developed, permitting the use of active, yet nonirritating ointments, creams, and aqueous lotions

Sulfur, in a colloidal state, possesses attributes not identified with any of its other physical forms, and for the sake of clarity it might be advisable to explain briefly what is meant by a colloid The general conception that it comprises a suspension of very finely subdivided particles in water is, for our purpose, not very wide of the mark, but it does not tell the whole story All soluble substances may be classified in two main groups, crystalloids and colloids. While this separation was believed by physicists of the last century to indicate two entirely distinct classes of matter, we now know that the difference between them is not so great.

Simply stated, crystalloids are substances that tend, under favorable circumstances, to form crystals, and which readily diffuse through most diffusion membranes Although they form the bulk of matter occurring in the mineral kingdom, in animal and plant physiology they play a minor role Yet, although they form a relatively small part of the total mass of the cell, they are fully as essential as the colloids.

Colloids were originally defined by Thomas Graham[1] in 1861 as substances which, while dissolving to the extent of showing no visible particles in suspension, either did not pass through diffusion membranes at all, or did so very slowly as compared to crystalloid substances However, as a result of modern developments in colloid chemistry, this distinction has been dropped, and since it is possible to prepare most substances in colloidal state, the difference between crystalloids and colloids becomes a matter of particle size only Furthermore, it has been possible to prepare membranes with pores so small as to retain molecules, or large enough to allow some colloids to diffuse through them.

The Colloidal Solution

Although we speak of "colloidal solution" colloids are *not* soluble, nor do they form true solutions, but rather very fine suspensions or pseudo-solutions, which vary slightly in their physical characteristics, and are respectively designated as sols, gels, suspensoids, and emulsoids These all have the external appearance of true solutions, since they are clear, homogeneous, and may be filtered without leaving any solid residue Under ordinary magnification no solid particles are visible, but under the ultramicroscope or electronic microscope, the suspended particles may be readily seen as luminous puncta, constantly in motion (Brownian movement) These particles vary in size from $^1/_{10\,000}$ mm to $^1/_{500,000}$ mm

The kinematic difference between true solutions and colloidal solutions may be explained on the assumption that a substance is dissolved by a liquid when the attraction of the molecules of the liquid for those of the solid exceeds the attraction of the molecules of the solid for each other Should the dispersion be of sufficient degree the solute would go into true or crystalloid solution, however, if the molecules of the solute cling to each other with an affinity greater than exerted by those of the solvent, dispersion will be less profound and the solute may form clusters or particles of colloidal dimension, the result being a "colloidal solution"

The Colloidal Sulfur Particle

Although sulfur colloids have many interesting scientific properties, that which seems to have most interest to the physician is the size of the particles themselves Generally, the diameter of a colloidal sulfur particle ranges between 0 0001 mm and 0 000001 mm In the English system of measurement the latter represents $^1/_{21\,000,000}$ of an inch. These limits are by no

FIG 1 Sulfur in sulfur ointment (U S P) × 1,500 diameters

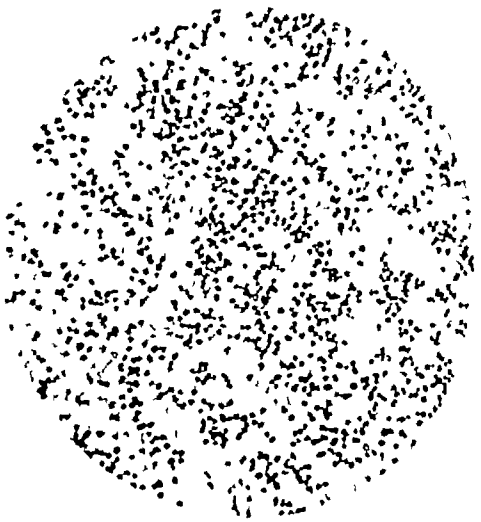

FIG 2 2 per cent aqueous colloidal suspension of sulfur × 1,500 diameters

means definite, but the smaller the particles, the more stable they are, and conversely, the larger the particles the less stable they are

Some idea of the tremendous surface area possessed by an element in the colloidal state may be obtained by noting that if a sphere of 0 1 cm radius, having a surface of 0 126 square cm , were subdivided to colloidal particles having a radius of about $^{1}/_{1,000,000}$ cm , the total surface area of the particles would amount to approximately *100 square meters*

The colloidal states of insoluble substances are not invariably identical with amorphous forms Although in general this is true, many substances, including sulfur, as colloids, form beautiful crystals exhibiting Brownian movement This might indicate that molecular elements exist in colloidal solutions, possibly in large aggregations, otherwise they would scarcely unite in definite spatial relations necessary to produce crystalline forms

In an attempt to illustrate the essential differences between colloidal sulfur and particles of precipitated sulfur in the U S P ointment, slides were made of both and examined under a high-power microscope [2]

A photomicrograph (Fig 1) shows the particles in U S P sulfur ointment (prepared with precipitated sulfur) under a magnification of 1,500 diameters By actual measurement these particles range up to 45 mm in diameter, or an actual size of 0 03 mm In other words, the particle of precipitated sulfur would yield 27,000,000 large colloidal particles having a diameter of 0 0001 mm

Fig 2 shows the tiny particles observable on a slide prepared from a 2 per cent aqueous colloidal suspension of sulfur It is impossible to photograph colloidal particles, since they are too small to be seen even with the most powerful microscope, and what is visible in this particular photograph are just a few of the colloidal particles which have agglomerated and precipitated on the glass slide The slide was left to dry and after several hours another picture was taken (Fig 3) Here, larger clumps of sulfur are seen These were formed by the continued precipitation of the sulfur as the water dried out, and give an approximate indication of the amount of sulfur actually contained in the colloid, not observable with the microscope until the colloid actually begins to break down with consequent precipitation and aggregation of the micelles

Colloidal particles are not visible with the ordinary microscope, even when an oil-immersion lens is used However, when a beam of light is passed through a colloid sol, the particles become observable because of the reflection of light waves on the surfaces of solid particles suspended in the fluid, just as rays of sunlight become visible in a dusty room (Tyndall's phenomenon) These light shadows appearing faintly in the background in the photomicrographs represent some of the smaller particles, too minute to be observed microscopically

Table 1 serves to illustrate the approximate diameters of material masses from the Einstenian universe to the electron, and its study should afford information regarding the relative size of the various types of matter

FIG 3 2 per cent aqueous colloidal suspension of sulfur after six hours exposure to air × 1 500 diameters.

TABLE 1*

Physical Limits	Approximate Diameters
Electron { positive	2. × 10⁻⁴ A
Electron { negative	3.8 × 10⁻⁴ A
Atomic Nucleus { H	2 × 10⁻⁴ A
Atomic Nucleus { Au	4. × 10 ² A
Atoms	0.1–0 6 mu
Molecules	0.2–5 mu
Molecular groups	0.5–10 mu
Primary colloidal particle	2–20 mu
Secondary colloidal particle	5–100 mu
Microscopically visible particle	Over 100 mu
Visible particle	Over 50 μ
Mass	Over 1 mm.
Planet (Earth)	1.3 × 10⁴ km.
Solar System	5. × 10⁹ km.
Star Cluster	5. × 10³ light year
Galaxy	5. × 10⁴ light year
Einsteinian Universe	2. × 10⁹ light year

* Modified from *Colloid Chemistry Theoretical and Applied* by Alexander and Bridges Vol. II Chemical Catalog Co., New York, 1928.

Now why is it essential to know the solubility or particle size of a topical remedy? For the reason that before it can exhibit any other than physical activity, it must be ionized, and unless conditions are favorable this does not occur

The importance of this process of dissociation or ionization reposes in the fact that in the case of most substances no chemical reaction can occur while the substance is in a nonionized state, nor do all substances ionize with the same readiness, which causes a great difference in their chemical properties For example, the reason acetic acid is a much weaker acid than hydrochloric is that it does not ionize to such an extent.

In the case of sulfur, this reacts when it comes in contact with the skin to form sulfides and other sulfur bearing compounds This is purely a chemical reaction which depends to a very large extent on the contact of sulfur itself with the epidermis. It will thus be obvious that the finer the state of subdivision in which the sulfur exists, the better and more intimate its contact with the skin and hence the more free the formation of active sulfur compounds

An insoluble substance is incapable of ionization This property is, therefore strictly speaking, attributable only to crystalloids and fluids in which molecules are freely dispersed However, colloids are capable of cataphoresis, and when an electric current is passed through water containing colloids in solution, the particles tend to pass to one pole or the other The nature of the charge depends upon the existence of high surface tension in colloidal solutions of sulfur, and it is this same property that explains, in part, the ability of the sulfur particles to remain suspended in a fluid which has a much lower specific gravity

Preparation of Colloidal Sulfur

Colloid chemistry is by no means a recent development in science nor did it spring, as remarked by Alexander, "like Minerva, full armed and panoplied, from the front of Jove" It is a development of many centuries Those interested will find *The Foundations of Colloid Chemistry, Selections of Early Papers Bearing on the Subject*, edited by Emil Hatschek and published by Ernest Benn, Ltd , of London, 1925, full of useful information.

It is of interest to note some of the methods which have been used in the past to prepare colloidal sulfur Wackenroder[3] and Selmi,[4] in publications dated around 1850, recorded their observations on suspensions formed by the interaction of hydrogen sulfide and sulfur dioxide resulting in what were probably the first more or less stable colloidal sulfur suspensions.

Since then, numerous methods have been described, among which are those of Raffo,[5] who precipitated colloidal sulfur from sodium thiosulfate with sulfuric acid, and Engel,[6] who prepared a similar product by precipitating sodium thiosulfate with hydrochloric acid, both giving a solution similar to Wackenroder's It was Raffo who observed that colloidal sulfur possessed chemical properties not inherent in the crystalloid form, and demonstrated that it reduced silver salts energetically, whereas even finely divided precipitated sulfur did not form silver sulfide in the cold, and did so only partially upon boiling

Colloidal sulfur has also been prepared by hydrolysis of sulfur monochloride by the method of Freundlich[7] and by methods designed to replace a solvent containing dissolved sulfur such as that of Von Wiemarn [8] who prepared it by pouring a solution of sulfur in alcohol into water

Finally, there is the method of triturating sul

fur in water with substances designed to facilitate the formation and stabilization of colloidal particles such as that used by Von Wiemarn,[9] who triturated it with glucose in water Other substances used for this purpose, all of which are emulsifiers, have been gum arabic, quillaia, tragacanth, chondrus (Irish moss), etc

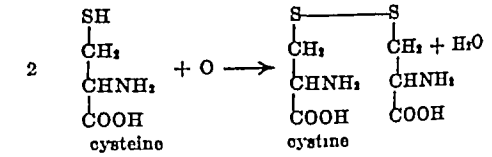
The purely chemically prepared colloids made according to the method of Wackenroder are moderately stable and contain particles which are comparatively small, whereas those prepared by replacement of solvent and by grinding methods are not very stable and the particles are, on the whole, much larger

Classification of Colloids

Although the simplest classification of colloids is probably that suggested by Wolfgang Ostwald, *distinguishing both the dispersed phases and dispersion media* as gas, liquid, or solid, a more practical and comprehensive classification is that of Zsigmondy who, following Hardy, divided colloids into two classes, the reversible and irreversible, the former redissolve after dessication at ordinary temperatures, whereas the latter do not In reversible colloids, such as gelatin, tragacanth, and acacia, there is a more intimate union between the dispersed phase and the dispersion medium, in fact, the two phases probably exist in a state of flux and constant interchange Colloids of this reversible type are hydrophilic or lyophilic, while the irreversible colloids are hydrophobic or lyophobic

The colloidal suspensions prepared by Wackenroder, Selmi, and Raffo are of this so-called hydrophilic type (emulsoids), while those of Von Wiemarn are of the hydrophobic type (suspensoids) Hydrophilic colloids of sulfur are the more stable, but even so do not stand up for very many months, and efforts have been made from time to time to confer upon them additional stability Most of these efforts have failed up to now and the colloid of sulfur used by the author in these investigations is the first adequately protected one which has yet been offered for clinical investigation *

It is a modification of Wackroder's solution containing colloidal particles, or micelles, which are aggregations of sulfur molecules with which polythionic acids, particularly pentathionic, and to a lesser degree, hexathionic acid, are mixed or absorbed



The so-called hydrophilic properties of this type of chemical sol are attributed to the presence of these polythionic acids, which, by reason of their high sulfur content, possess an affinity for sulfu and, because of their high oxygen content, pos sess an affinity for water They, therefore, serv as connecting links between the micelles and th water molecules effecting a perfect hydrophilic reversible colloidal solution

The Pharmacodynamics of Sulfur

This is extremely complex and the subject o constant study While much is still obscure some of the activities of sulfur in relation t keratoplasia and keratolysis are fairly well under stood

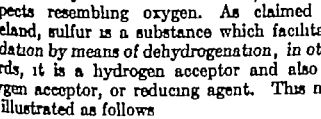
Keratoplastic Action—First let us conside briefly what is meant by keratoplasia, Tersely we mean the aggregate of chemical processes in volved in the normal formation of keratin, th principal ingredient of the stratum corneum The basic changes are oxidative, the norma process of cornification occurring through the formation of disulfide groups at the expense of thiol groups Chemically active sulfur is essential for this process It is one of the most important elements in the skin, occurring in three of the skin's most important compounds, cysteine, cystine, and glutathione Cysteine is thioaminopropionic acid, cystine is di-(thioaminopropionic acid), and glutathione is a tripeptide containing cystine, glutamic acid, and aminoacetic acid

During the process of normal keratinization cysteine is converted to cystine of the horny layer as follows

Besides cysteine, glutathione, also a bearer of the sulfhydryl or thiol group, partakes in this oxidative process Disturbance in the normal rate of this process, which results in disturbance of the normal balance of the essential skin constituents, leads to an abnormal skin condition Not only is oxygen necessary for this reaction, but it will not occur in the absence of SH groups in the protein molecule Now cysteine is an extremely unstable compound and in the presence of excess oxygen as a result of cutaneous hyperemia and inflammation, or excessive exposure to actinic rays of a wave length between 2,900 and 3,300 Angström units, overproduction of immature, nucleated, parakeratotic cells containing oxykeratin eventuates (responsible for senile keratoses, chronic actinic dermatitis, etc) In addition there is also an associated hydrops of the epidermis, so that a supply of oxygen which is *not excessive* is necessary, not only for normal

* The colloidal sulfur cream used in this investigation was Collo-Sul Cream, and was supplied by the Crookes Laboratories It consists of 2 per cent colloidal sulfur in an emulsifiable, greaseless, nonstearate, vanishing-type base, pale yellow in color and pleasantly perfumed

TABLE 2



Number	Diagnosis	Average Duration of Therapy	Results Improved	Unimproved	Cured	Per Cent Cured and Improved
37 (hospital)	Acne vulgaris	2.8 weeks	15	12	0	55
11 (private)	Acne vulgaris	17 weeks	7	2	2	81
19 (hospital)	Pityriasis capitis	3 weeks	13	4	2	78
21 (private)	Pityriasis capitis	6 weeks	6	5	10	76
9 (hospital)	Seborrheic eczema	2.4 weeks	6	2	1	66
3 (private)	Seborrheic eczema	3.3 weeks	0	2	1	33
2 (hospital)	Rosacea	2.5 weeks	0	2	0	0
5 (private)	Rosacea	5.4 weeks	2	2	1	60
1 (private)	Furunculosis	4 weeks	0	1	0	0

keratinization but also for dehydration of the epidermis

Now, in what respect will the application of sulfur to the epidermis encourage the formation of mature, normal horny epidermis? In order to understand this we must appreciate that it is an extremely facultative element, in many respects resembling oxygen. As claimed by Wieland, sulfur is a substance which facilitates oxidation by means of dehydrogenation, in other words, it is a hydrogen acceptor and also an oxygen acceptor, or reducing agent. This may be illustrated as follows

$$H_2 + S \rightarrow H_2S \text{ (sulfur as H acceptor)}$$
$$H_2S + 2O_2 \rightarrow H_2SO_4 \text{ (sulfur as O acceptor)}$$

When colloidal sulfur comes in close contact with the skin, in the presence of bodily warmth, perspiration, and light, it combines with the sulfhydryl (SH) radical of the cysteine to form hydrogen sulfide (H_2S) as follows

Some of the sulfide in turn unites with free oxygen (O_2) from the air and lymph to form polythionic acids This utilization of oxygen retards the oxidation of cysteine, thus facilitating more normal maturation of keratin and reducing parakeratosis

The polythionic acids, because of their hygroscopic properties, effect dehydration of the epidermis. The presence of pentathionic acid in the colloidal sulfur micelle is considered by Goodman and Gilman[10] to be a distinct asset They state that "colloidal sulfur is the most active form of sulfur"

Keratolytic Action.—By keratolysis we mean a solution or lysis of the keratin layer of the skin While not as significant as its keratoplastic action, sulfur is capable of keratolysis. This is dependent upon the formation of hydrogen sulfides (H_2S, H_2S_2, H_2S_3, H_2S_4, H_2S_5) As previously mentioned, whereas these are all keratolytic, they are also capable of absorbing oxygen to form polythionic acids (H_2SO_3, H_2SO_4 $H_2S_2O_6$ etc.), thus retarding the cysteine-cystine reaction

Colloidal Sulfur in Therapy of the 'Seborrheic Dermatoses

We have selected the term "seborrheic dermatoses" to designate those inflammatory and noninflammatory disorders associated with some quantitative or qualitative change in sebaceous secretion, or which have a predilection for those regions where sebaceous glands are either more numerous or of greater size (On the scalp the average gland is smaller than on the glabrous skin)

Miller[11] pioneered in this country in treatment of these dermatoses with colloidal sulfur, reporting uniformly good results, in most instances superior to those obtainable with other forms of sulfur

In our series we treated 38 patients having acne vulgaris, 40 with pityriasis capitis, 12 with seborrheic eczema affecting the ears, axillae, chest, or face, 7 with rosacea, and 1 patient with furunculosis of the scalp

The results are tabulated above.

Comment

Acne Vulgaris.—The colloidal sulfur cream was the sole topical application in all cases Internal medication differed and was individualized However, any effect of systemic treatment was insignificant Patients massaged the cream into their faces each evening, after washing with soap and water Some of them used a sulfonated oil In the morning additional cream was applied with water, the cream being used as a detergent instead of soap The better control exercised over private patients resulted in a higher percentage of patients improved and cured. One patient developed a mild dermatitis and in 2 the cream was excessively drying to the face

Pityriasis Capitis.—Patients discontinued the use of soap shampoos. The cream was massaged well into the scalp each night, and once weekly, using more cream as a detergent with plenty of warm water, a shampoo was given.

Those patients designated as cured continued to use the cream as a detergent every one or two weeks It was noted that if the patient resumed using soap as a detergent, scale and itching recurred

Seborrheic Eczema—Of course, none of these cases were acute or vesicular Response was not particularly good, but there was no tendency to a contact dermatitis, as is not infrequently observed when precipitated sulfur is used topically

Rosacea—The extreme chronicity and complicated and often obscure cause of this dermatosis do not favor its prompt response to any topical remedy Nevertheless, several of the patients did well, better, in fact, than could be expected from greasy sulfur ointments

Furunculosis—After four weeks' application twice daily with frequent shampoos there was no improvement Subsequent favorable response to oral penicillin was immediate

Conclusions

1 Sulfur in the colloidal state can be prepared in a stable form, properly protected against deterioration and suitable for topical application to the skin

2 Therapeutically it is superior to precipitated sulfur and, because of the fineness of its subdivision and consequent augmentation of surface area, colloidal sulfur may be used in much lower concentrations

3 In a neutral, emulsifiable base that can be readily removed from the scalp with plain water it is superior to precipitated sulfur in other bases for the treatment of pityriasis capitis or seborrheic eczema of the scalp

4 As a topical application, colloidal sulfur, in a neutral emulsifiable base, is both an acceptable and an effective remedy in the treatment of acne vulgaris

PALESTINE TO HAVE MEDICAL SCHOOL

To prevent a decline in the health of the Palestine population that might threaten peoples of all the Middle East, the Hebrew University and Hadassah, the Women's Zionist Organization of America, will build a nonsectarian medical school on Mount Scopus in Jerusalem, it was announced on September 19 The prospective institution, it was disclosed, will be the first one to train physicians in Palestine

Ira A Hirschmann, vice-president of the Metropolitan Television Company, and Mrs Samuel J Rosensohn, national treasurer of the women's group, who are cochairmen of a committee to raise $4,000,000 for the project, made plans for the school and also revealed that headquarters have been established at 16 East Forty-eighth Street, New York City, for a two-year national fund campaign, to be started immediately

According to current schedules, the goal of the financial drive will not only meet the cost of construction, equipment, and five-year maintenance of the school—which will be known as the Hebrew University-Hadassah Medical School, but will provide an additional one hundred beds in the Rothschild-Hadassah Hospital, a part of the Hadassah-University Medical Center The increase will bring the hospital's total bed strength to four hundred and forty

"Such a school," Mr Hirschmann declared, "would not only replenish the shrinking medical profession with skilled young men in a part of the world where constant vigilance must be exercised to control epidemic and endemic diseases, but would be an inspiring example of the resurgent will to reconstruct institutions of peace and goodwill"

He emphasized that, because a supply of Jewish doctors from Europe had been shut off from Palestine, the scarcity of physicians there is becoming critical

Unless a medical school is set up to furnish well-trained young doctors "the population of Palestine, Arabs and Jews alike, will suffer a decline in health that will become a hazard to the people of the entire Middle East," he declared

Present plans call for three main buildings, with provision for future expansion and use of certain departments of the existing Nathan Ratnoff Building, now housing the postgraduate medical school of the university Other facilities of the university and medical center will become part of the projected school

Mr Hirschmann reported that coordinating groups have worked for three years on plans for standards equal to those of the best medical schools in the world Great care, he promised, will go into choice of the faculty for the training institution and outstanding men from America, Palestine, and other countries will be appointed to its posts

The American Jewish Physicians Committee is associated in the campaign with the American Friends of the Hebrew University and Hadassah—*New York Times, Sept, 20, 1945*

OBJECTORS TO ELECTRIC SHOCK TREATMENT ARE REFRACTORY TO ITS THERAPY

HIRSCH LOEB GORDON, Capt ,(MC),AUS, Northport, New York

(From the Veterans' Hospital)

SOME electric shock therapists have pointed out two antipodal attitudes to this form of treatment met with among patients. At one extreme we find those who dread it and are overwhelmed by terror when they are about to be taken to the treatment room and look upon the electrodes as instruments of torture To relieve their apprehension and prevent their unavoidable altercations with the ward staff and its unpleasant sequelae, some form of preshock sedation, like sodium amytal, is given. At the other extreme are, according to them, the penitent and conscience-smitten patients who demand that this treatment, considered as a form of electrocution, be meted out to them as a punishment in expiation of real or imaginary transgressions against the commandments of the Lord and the equity of man.

The writer regrets to state that among the considerable number of patients treated by him in a municipal and federal mental hospital none of the above-mentioned fearful or solicitous attitudes ever manifested themselves However, he did encounter a small number of them, about 10 per cent of the total, who were averse to submitting to electroshock therapy, but for quite other motives, as is clearly evident by their behavior They too may be divided into two different groups, though not in sharp contrast to each other as the former

The larger group consisted of schizoid catatonics in the full flourish of their symptom tetrad mutism, negativism fasting, and stereotypy They opposed every effort at guidance and resisted all attempts to make them do things, or even change their posture Inasmuch as the administration of an electroshock treatment involves many operations requiring cooperation on the part of those being treated, the catatonic will resist and very often wrangle at every step of this procedure, whether it be the transfer to a special room, the change from a day suit to pajamas, or the insertion of the mouth gag and application of the electrodes to the temporal regions. Their resistance to the electroshock treatment is *not specific* but a part of a general tendency to perseverance of the assumed posture and of violent resistance to change They are not electroshock resisters in particular, but *negativists* in general The smaller, but more interesting group of electroshock resisters resemble the catatonics in their body build they are asthenic and slender but to all appearances they do not show the catatonic tetrad of symptoms. Most of them wear the schizophrenic label, though occasionally they come from the group of affective psychosis, in the depressive stage. They are generally in good contact, cooperative, neat, and well oriented, and their speech is coherent and relevant However, their judgment and insight are impaired and they entertain delusions and hallucinations, ideas of reference, and, occasionally, feelings of depersonalization. But as soon as they are about to undergo electroshock treatment they show displeasure and resentment, without rage or signs of fright They insist on seeing the doctor immediately and when that privilege is granted to them they begin to plead with him to excuse them from electroshock, arguing without weighty arguments "Doctor, I don't need *any* treatment. There is nothing the matter with me. No one of my family requested it for me. I don't belong here etc" The treatment has to be given to them against their wish, yet not much compulsion is required to obtain their passive cooperation and they yield, physically, under protestations These remonstrations continue unabated throughout the course, before every application And as the treatments progress numerous somatic complaints are made by them in support of their demand to have them interrupted Blindness, deafness, colds, dandruff, muscular pains, and bone fractures have resulted, according to them, because of the "electricity," and the ever-cautious therapist rushes them to various clinics, to x ray and to the "acute" division for a check-up, and their course is thus protracted through many extra weeks A favorite question of patients of this group is "Doc, how many treatments did I have already? I think I took many more than you say I did Is it not time to stop them altogether?" Inasmuch as this group does not really resist electroshock treatments nor do they dread them but object to them, I name them electroshock *objectors*

While the resistance of the catatonic *negativists* diminishes with each succeeding treatment and occasionally disappears after the very first application, the aversion of the *objectors* to the same never subsides but is occasionally on the increase. This is the first observation made by the writer

But besides this unabated objection noted among them an even more striking distinction is

noted between these two groups While the former, the negativists, show the most gratifying result of the efficacy of electroshock as they are relieved of their muscular rigidity, develop a good appetite and contact, become talkative and sociable, and are soon found capable to be entrusted with the most important tasks of ward management given to patients, to the delight of the ward staff and the amazement of the relatives, the latter group, called by us objectors, derive no benefit whatsoever from these treatments They rise from this long ordeal laden with their full array of delusions, hallucinations, and other abnormal ideas and attitudes as if nothing had been done for them Those who objected the most and the longest were the least affected by these treatments

It seems rather difficult to assume that the effect of the powerful stimulus, a veritable shock, given to the brain tissue by the passage of electric energy from the apparatus, can be nullified by the objection of the individual This objection was a sentiment active in the waking condition which should have vanished when his conscious state was extinguished in the wake of the truly electrical storm One can easily conceive the dependence of such therapies as suggestibility, hypnosis, and psychoanalysis on the volitional response of the one treated, but an electrical impact, like a surgical intervention, should be able to defy the resentment of the patient, as long as he cannot hinder physically its performance

To explain this phenomenon and many other aspects of electroshock therapy one would have to ascertain what parts of the brain tissues are affected directly or by dispersion when the artificial outside electric current passes through them and what changes take place in them This involves a great deal of speculation in the problem of localizing mental and emotional activities in the various parts of the brain, in suggesting the type of alterations that result in those parts with the various psychotic derangements, and explaining how the artificial transition of electric current through them dislodges, banishes, or inactivates temporarily those aberrations from the normal

We are inclined to agree with those who maintain that *structure and function are inseparable* and that the discovery and localization of structure changes in many mental illnesses presently called "psychogenic" and *non*organic are to be anticipated in the future with more refined means of detection

The known physiologic responses of nerve cells might be classed as thermal, chemical, and electrical The flow of electric energy through the temporal-frontal lobes involving the cortical and subcortical structures, harboring countless patterns of mental activity, surely evokes responses of varied degrees in all the three phases It has been suggested that mental and emotional processes may be correlated with alterations in the colloidal status of the nerve cells *activity* with colloidal *aggregation* and *stupor* with colloidal *dispersion* It has already been shown that epileptic fits affect the water balance of the brain cells by causing a diuresis The anticonvulsive drugs have, therefore, a dehydrating side effect

Electroshock, it must be remembered, is an artificially inducted epileptic fit As the ionic equilibrium depends essentially upon the distribution of electrolytes, it cannot avoid the effect of this treatment Inasmuch as a disturbance in carbohydrate metabolism has been noted in psychotic patients, the electric current affects, probably, the brain metabolism too Oxidizing processes in the nerve cells have also been correlated with emotional experiences According to some workers, mental illness is a disease of the autonomic nervous system Schizophrenia is supposed to result from the hypofunction of this system and its stimulation will bring about improvement Electroshock hinders respiration, and the severe anoxia that develops is a powerful stimulus to the sympathetic center This aspect recalls well the stages of an epileptic fit when vascular spasm causes cerebral anemia (tonic phase) followed by compensatory hyperemia (clonic phase) The known and unknown factors in the endocrinologic secretions activate or inhibit many of our emotional states

It has already been conjectured, with fair proof, that a state of excitement and irritability followed by fatigue and relaxation is common to many nervous and mental disorders Their targets may be muscular or visceral foci This theory is very helpful in the postulation of a rationale for the electroshock mechanism and effects Catatonic and depressive states, for which electroshock holds most promise, are states of irritable tension and rigidity The traversing of electric energy through the brain makes this tension more taut, so to speak, as seen by the initial tonic phase that the entire body assumes This "tautness" is probably pushed to its unyielding limit in order to achieve the maximum recoil into a state of fatigue and relaxation Using a popular expression emanating from the wisdom of the common people, whose figurative speech is often colorful and descriptive, we would say that no "screw" is "loose" in the brain structure of a mentally ill patient, but, on the contrary, its elements are, so to speak, too tightly joined together whether his behavior is tense and rigid or overactive in speech and action, as the latter is also a form of tension, an inability

to arrest and stop exaggerated drives and compulsions

It is during this state of relaxation that improvement or cure from mental illness is apt to occur This sudden cessation of rigidity and reversion to passivity and calm compares well with the effects of sedative drugs and prolonged sleep For our present purpose it makes no difference whether the electric current introduced into the brain tissue causes this state of remedial relaxation by acting on the thermal, chemical, or electrical properties of the nerve cells, on their colloidal status, water balance, ionic equilibrium, or carbohydrate metabolism and oxidative processes, as long as it is achieved Many other biochemical investigations brought out contrasting and thus inconclusive results, due to the diversity of methods

The shock objector who tries in vain to prevent the physician from forcing on him this treatment finally submits his body to it. Placing himself face up on the treatment table and permitting the electrodes to be applied to his temples, he preserves within him the full force of his unbent resentment to this procedure He mobilizes against the forthcoming electric current what Jung called the controlling force of mental life—his *will*

By pressing the special button on the electroshock machine a "tempest" is created within the cranium, with literal repercussions all over the body, no part remaining unaffected Consciousness is obliterated Yet those mental aberrations that are surely structurally connected with the brain tissue have not been ejected or may not even be contacted, lying, so to speak, sheltered, inside the defenses of the *will*. This will, this resolute intent, this deliberate resistance has defied the onslaught of electric energy and blocked its way to the areas of anomalous mental patterns called diseases It has already been noted by many a physician how a patient can deliberately block the effects of a narcotic drug and thwart sleep and even somnolence But the thwarting of the effects of electric current on the cerebral sources of psychosis by sheer volitional impediments when the entire body is violently shaken and thrown out of gear is probably a more emphatic indication of the inseparable psychosomatic interacting unity of a living organism There is, of course, the possibility to consider that these shock objectors who are immune to its therapeutic benefits represent a special reaction type in psychopathology scattered throughout many of the standard groupings. In the realm of physical nosology the failure to respond to a specific remedy is enough to differentiate and separate one malady from many others of similar symptomatology and often directs us in a successful search for its specific cause and therapy Shock-refractory patients would thus form a class in themselves. However, their particular refractability would still baffle us and the theory previously promulgated by the writer would still serve its purpose

Psychotherapy has long been recognized as a required supportive measure to every form of shock treatment given. And here too we noticed the sharp dividing line between the negativists and the objectors While the former have been amenable to it and improved by it, showing a marked and progressive approach to normal thinking and feeling with every successive interview, the latter persevered in their psychotic behavior The writer assumed that the negativists, who did not interfere volitionally with the propagation of the electric energy through their brain, thus "softened up" their abnormal ideas and attitudes and became receptive to suggestion and reassurance, and their partially relaxed psyche, like a freely expanding sponge, favored absorption from the outside, while the objectors, whose citadels of psychosis were not penetrated by the electric current and the accumulated false notions left in them in tense apprehension, were inaccessible to the therapists' persuasive talks On the basis of this conjecture, which is expressed here in figurative speech for the sake of clarity, the writer abstained from giving shock objectors a single electroshock treatment before these objections could be banished by a series of talks, if ever This delay, if persuasion succeeded, or the refusal, if persuasion too found them refractory, spared us from wasting our time and spoiling our disposition in treating argumentative and complaintive patients with no hope for their improvement.

Summary

1 Patients who have a special fear of electric shock treatment or who, on the contrary, ask for it as an expiative punishment for committed transgressions are very rare.

2 There are, however, opponents of shock treatments divided into two groups (*a*) Negativists, comprising catatonics in the full flourish of their symptoms, who resist shock treatment or any other treatment or enforced guidance, (*b*) Shock objectors, asthenic and slender, as the catatonics, delusional, hallucinatory, and occasionally depersonalized, neat, well oriented, and in good contact, who offer no physical resistance to shock treatment but try to persuade the therapist with ardent pleas, before every application, not to submit them to these treatments because they are "not in need of them"

3 While the catatonic negativists are the greatest benefactors from electric shock treat-

ment, the group of shock objectors is completely refractory to it

4 The astonishing fact that the induced electric energy, which creates a veritable electric storm in the cranium and throws the entire body into powerful convulsions, blacking out consciousness at the same time, fails to affect the psychotic patterns of those who object to them in the waking state leads the author to review various correlations between nerve-cell states and activities and mental processes and to postulate the following

5 The curative moment in the procedure of electric shock treatment is the period of fatigue and relaxation following the initial tension reaching its highest limits, nervous and mental disease being a state of irritable tension

6 The objector's resentment against shock, in the form of mobilized will power, is not banished through loss of consciousness, but surviving the electric storm, defiantly prevents access to the "areas" or "processes" of psychotic activity

7 This phenomenon is an additional proof of the inseparable psychosomatic interacting unity of a living organism

8 To make shock objectors benefit from electric shock treatments, psychotherapy must precede the initiation of the course, that may begin only when the patient's objections are banished by his inner conviction and the road to his psychotic ideas left undefended by an opposing impregnable will Psychotherapy should, of course, be continued and given between the electric-shock applications and following their termination

---

THE PROGRESS OF THERAPY

Physicians, listing the ten most important drugs used in medicine in 1910, chose them in the following order (1) ether, (2) morphine, (3) digitalis, (4) diphtheria antitoxin, (5) smallpox vaccine, (6) iron, (7) quinine, (8) iodine, (9) alcohol, and (10) mercury Just five years previously the Council on Pharmacy and Chemistry had been established to eliminate from medicine the shotgun therapy based on indiscriminate empirical remedies Out of their efforts came such works as *Useful Drugs* The same impetus brought about intensive revision of the *United States Pharmacopeia*, which today, along with *Useful Drugs* and *New and Nonofficial Remedies*, may be said to constitute the proved armamentarium of the physician

Tremendous advancement has occurred in the field of therapy since 1910—so great indeed that it is almost impossible to list today ten individual remedies which might be said to be the ten most important or useful in medical practice In an effort to determine what leaders in medicine might choose as most important in 1945 the editor of the *Journal* of the American Medical Association addressed a communication to some of the professors of medicine in leading medical schools The largest number of replies put penicillin first In considering penicillin, however, other antibiotic drugs were added Certainly the sulfonamides come exceedingly close from the point of view of their application under a wide variety of circumstances At least five of the physicians consulted placed morphine first on the list of important drugs, yet many added to morphine the names of some of the barbituric-acid derivatives Ether still merits a place on any list of important drugs, but today the anesthetist has access to nitrous oxide-oxygen, cyclopropane, ethylene, local anesthesia, spinal anesthesia, and continuous caudal anesthesia as well as the basal anesthetics injected directly into the blood Digitalis still holds a place among the most important of remedies The diphtheria antitoxin of 1910 is now supplemented by innumerable antitoxins and vaccines established as specific against certain infections New on the modern list are blood plasma, whole blood for transfusions, gamma globulin, and all of the other substances derived from blood. Little was known in 1910 of the products of glands Today the life-saving properties of insulin, liver extract, estrogenic and male sex hormones, adrenal, and thyroid are unquestioned Little was said in 1910 about vitamins, but the vitamins must be included in any significant list because of their specific virtues in cases of established deficiencies such as rickets, scurvy, pellagra, and beriberi Questionable on any modern list would be the arsphenamines If penicillin develops as is anticipated in the treatment of syphilis, the arsphenamines may go far down on any list of important remedies Since malaria appears to be the most widespread of all diseases on the face of the earth, the quinine of previous generations must be assisted by quinacrine and other specific antimalarial remedies

A 1945 list of the most important remedies might be

1 Penicillin and the sulfonamides and antibiotics
2 Whole blood, blood plasma, and blood derivatives
3 Quinine and quinacrine
4 Ether and other anesthetics, morphine, cocaine, and the barbituric-acid derivatives
5 Digitalis
6 Arsphenamines
7 Immunizing agents and specific antitoxins and vaccines
8 Insulin and liver extract
9 Other hormones
10 Vitamins —*J.A M.A , March 10, 1945*

THE MANAGEMENT OF VARICOSE ULCERS

LEONARD K. STALKER, M D , M S , Rochester, New York

A VARICOSE ulcer is one of the most common complications of varicose veins of the lower extremities The majority are seen in individuals with neglected, advanced varicosities and associated stasis, but it is important to mention that the development of such an ulcer is not necessarily dependent on the severity of the varicosities It has been my experience that in all cases in which a varicose ulcer develops there has been a demonstrable incompetency of either one or both of the greater or lesser saphenous systems. In addition to this, incompetency of one or more communicating veins in the lower leg can usually be demonstrated

The diagnosis of a varicose ulcer is not difficult, and while specific neoplastic and traumatic lesions do occur on the lower extremities, the vast majority of leg lesions are related to disturbances of the venous circulation A varicose ulcer is usually a chronic, progressive, necrotizing lesion which fails to heal spontaneously They are most often situated on the inner aspect of the lower third of the leg and ankle The highest level at which they are occasionally found is the juncture of the upper and middle thirds of the leg A few will be found on the lateral aspect of the leg and ankle They appear in the center of a pigmented, indurated area and are extremely painful Cellulitis is always present in varying degrees, and results in a copious, offensive discharge

I believe, with Heller,[1] that such lesions represent the effect of a nutritional deficiency on the functions inherent in cutaneous cells. These functions are impaired because of an ischemia arising from peripheral arterial or venous disturbances The region of the lower leg and ankle is particularly vulnerable to such disturbances because of its exposed and dependent location, poor protective padding of bone prominences, and a relatively meager arterial supply When the skin in such a static area is traumatized, bacterial invasion promptly leads to necrosis and ulceration There is little question that phlebitic inflammatory disease forms the basis of varicose indurations and ulcerations, and once ulceration has occurred secondary infection is introduced and becomes an exceedingly serious factor

When examining individuals with ulceration on the lower extremities, the possibility of malignant degeneration, tuberculosis, syphilis, and fungoidal and chemical causation must be considered A few ulcers are associated with arterial disease, and the possibility of arteriovenous aneurysms is one of the serious considerations It is difficult to differentiate between those ulcers associated with obstructive thrombophlebitis and impairment of the deep venous circulation and those attributable to varicose veins alone These two conditions will be separately discussed and individual methods of treatment outlined

Treatment

Ulcers Without Deep Phlebitis—It has been frequently mentioned that all patients who have varicose ulcers should be treated conservatively and surgery postponed until the ulcer has healed and evidence of inflammation disappeared It is my impression, and I have followed this method of treatment for a period of more than ten years in a great number of cases without regret, that the necessary ligation of the incompetent venous system should be carried out to cure the ulcer[2] Primarily, if one adequately treats the incompetent venous system in the face of ulceration, very few other adjuncts in the treatment will be necessary, and all ulcers can be healed with the patient ambulatory

It is true that if a patient is hospitalized and the leg elevated, a varicose ulcer will heal without any further treatment However, as soon as the patient walks, edema develops and the ulcer recurs In order to create the best conditions for healing, it is necessary to prevent edema. Several factors produce this edema, namely, incompetency of the venous system and inflammatory changes in the region of the ulcer The incompetency of the venous system can easily be handled by performing a combined division and ligation of the greater and in some cases of the lesser saphenous veins, together with separate division and ligation of the uppermost tributaries, and where feasible, to ligate the communicating veins unless such are in the base of the infected area. These can be handled at a later date, and in many instances can be adequately treated by injection of a sclerosing agent

The aforementioned ligation is performed by a method previously described by Heyerdale and myself[3] Following this, the sclerosing solution is judiciously used until complete obliteration of the involved superficial venous system takes place In those cases in which considerable inflammation and infection is present in the region of the ulcer, no injections are carried out until this subsides, but in other cases, injection treatment is carried on as in those cases of uncomplicated varicose veins Together with this, some

type of elastic support is used In all cases in which edema is present, a bland type of ointment is usually applied to the ulcerated area I have rarely found it necessary to confine my patients to bed or to employ such measures as Unna's boots, rubber sponge dressings, etc In the majority of instances a varicose ulcer can be expected to heal within a period of four to six weeks, and many will heal within two weeks following ligation In a few cases the healing is complicated by the severity of the secondary infection, but in most of these instances this can be combated by the use of sulfa drugs, penicillin, streptomycin, or other antibiotic substances

Ulcers Associated with Deep Thrombophlebitis — If a thrombophlebitis has involved the deep venous system it is likely to be followed by chronic venous insufficiency in the leg Varicosities develop secondarily and frequently will be followed by ulceration and cellulitis Complete occlusion of the deep circulation is a contraindication to surgical treatment It is a rare condition, and the diagnosis is not difficult Many individuals will be seen in whom the history of a deep thrombophlebitis exists, but on examination it will be found that the deep venous system has recanalized, or sufficient deep collateral channels have developed, and an adequate venous circulation exists In these cases the same treatment can be carried out successfully as in the group in which no deep phlebitis has been present However, in many of these cases a partial occlusion of the deep venous system exists, and complete improvement cannot be accomplished, that is, the ulcer will heal and remain healed, but there may continue to be a certain amount of swelling in the extremity The simplest method of determining adequacy of the deep venous circulation is to apply a snug elastic bandage from the base of the toes to the knee This restricts the superficial circulation, and if after wearing this for a period of thirty to sixty minutes the patient has no discomfort, the physician can be certain that the deep venous circulation is adequate.

In those cases in which the deep venous occlusion contraindicates surgery, there is little alternative but to put the patient to bed and elevate the extremity, treating the ulcerated area conservatively until it heals Following healing, these patients are given instructions in keeping the leg as free from edema as possible, and in many instances some relief will be obtained if a not too snugly applied elastic bandage is used when they are on their feet

These patients who have maintained chronic edema for a prolonged period of time, regardless of whether or not there is any degree of occlusion of the deep venous system, require in addition to other treatment elastic support to the leg The healing of the ulcer in these cases will require more time and the revascularization and softening of the infiltrated tissue may require a period of months The rapidity with which this occurs will depend entirely on the degree of cooperation obtained from the patient in regard to maintaining the extremity without swelling at all times As yet no supportive bandage or stocking has been invented that is perfect The elastic stockings are neat, but the fit must be perfect, and they wear out in a relatively short time Bandages must be reapplied frequently and many patients object to their appearance Heavy, pure rubber bandages are the strongest and most satisfactory support in the presence of severe edema, but they are hot and at times uncomfortable Many patients refuse to wear these because the symptoms of carrying a small amount of edema seem less troublesome than the discomfort of the bandages However, if the involved extremities can be kept edema-free for a prolonged period, a year or more, there is a fair expectancy of being able to dispense with supportive bandages

Factors Which Complicate Treatment—Many of the patients who have varicose ulcers are indifferent, careless, indolent individuals, and it will be difficult to obtain their cooperation in treatment, and thus a much longer time for healing may be required Age has been no contraindication in treatment of these cases, but the older the patient, the more apt one is to find an associated arteriosclerosis with a somewhat impaired arterial circulation This may contribute to a slower healing of the ulcer in some cases Varicose ulcers will heal more slowly in obese patients than in slender patients This is probably due to the fact that there is poor vascularization of the fatty tissue, and in many such individuals dependent edema exists without noticeable degree of venous insufficiency

There are many conditions associated with varicose ulcers that are not the result of the ulcers, but are the sequelae of the primary pathologic condition, that is, stasis These conditions are stasis dermatitis, pigmentation, edema, brawny infiltration, phlebitis, and cellulitis. Stasis dermatitis, edema, and pigmentation are the most commonly associated conditions The majority of these are improved when the treatment for the varicose ulcer is carried out The hemosiderin deposits which produce the pigmentation will usually lighten, but invariably do not disappear When brawny infiltration of the type in which the surrounding tissue feels hard and woody is present, there has invariably been some degree of cellulitis with thrombophlebitis and occlusion of the lymphatic channels The prognosis in these cases must be somewhat guarded, and as has been pointed out above, the

healing of the ulcer will require more time and it may be necessary to utilize supportive measures indefinitely

Comment

There is no stereotyped treatment which is effective in the treatment of varicose ulcers Each case is an individual problem the treatment of which must be individualized after careful analysis of the arterial and venous circulation of the extremity A careful general history and examination must be done in order to exclude associated or aggravating conditions The time and type of treatment will vary with the individual surgeon and his experience

It is likely that in the future the number of varicose ulcers will decrease. This is a result of the fact that it has become well known that there is a treatment for varicose veins and also that the chronic ulcers which are difficult to heal are the price of neglect Patients are rapidly becoming aware of the fact that, aside from the disfiguring effect of varicose veins, they increase the risk of phlebitis, hemorrhage, and ulceration, and as a result are seeking treatment even before symptoms occur The obstetricians have become aware of the fact that it is advisable to treat varicosities during the course of pregnancy The surgeon has become aware of their importance as a factor in postoperative embolus and phlebitis The treatment of phlebitis has advanced greatly with the introduction of anticoagulants, paravertebral nerve block, and a better understanding of the underlying physiology and pathology, so that fewer of the complications of the chronic deep venous occlusion may be expected

Summary

A discussion of the so-called varicose ulcers of the lower extremities has been made. A method of treatment of such ulcers in the absence and in the presence of deep venous insufficiency has been outlined A brief discussion of the factors which complicate the treatment of varicose ulcers was made

OUTPUT OF CARBON 13 INCREASED

Expanded production of Carbon 13 which, recent experiments in biochemical research indicate "gives promise of ranking in importance with x ray as a tool of medical science" was announced on January 1 by the Sun Oil Company and the Houdry Process Corporation

The isotope, so rare that production has been at the rate of less than 1/2 ounce a year "may be compared to a chemical microscope that makes it possible for the chemist to see and follow chemical reactions in the body not possible with the x ray" a joint statement declared

The companies announced plans for construction by Sun Oil of two plants to produce "comparatively substantial quantities of Carbon 13" Houdry now has in operation, at Marcus Hook Pennsylvania, a thermal diffusion plant producing about 1/4 Gm. of Carbon 13 a month and has made this available without cost to members of the Isotope Research Committee

The present cost of Carbon 13 is $400 a gram the statement said, adding that the new plants should reduce this to $40

Carbon 13 has been described as appearing like an ordinary carbon. It can be used to produce any of the compounds normally composed of carbon, such as sugar alcohol, the hydrocarbons of gasoline and thousands of others, including synthetic rubber Or, the statement continued, Carbon 13 can be used to grow vegetables which have some or all carbon atoms with atomic mass equaling 13 These compounds and vegetables, injected into or eaten by living organisms, including humans contain the necessary "tracers" by which their effect on body functions can be discovered.

Research with the isotope, the companies said, has already led to discovery of how fats are broken down in the animal organism to create energy necessary to carry on the life process. In contradiction of a long-established theory, Drs. C H. Werkman, of Iowa State College and Dr E. A. Evans, of the University of Chicago, reported after experiments with Carbon 13 that animals as well as plants utilize carbon dioxide.

"The possibilities of research with Carbon 13 are almost beyond imagination," the statement said. 'It is a new and powerful tool for a revolutionary approach to studies of the fundamental processes that occur in all living things, as well as metabolic disease processes such as cancer, diabetes hardening of the arteries, so-called 'heart trouble" and others."—*N Y Herald Tribune Jan 1, 1945*

DUODENAL OBSTRUCTION CAUSED BY CHRONIC PYELONEPHRITIS AND HYDRONEPHROSIS

BENJAMIN SHERWIN, M D , F A C S , and EDWARD E ROCKEY, M D , New York City

(From the Surgical Service of the Lincoln Hospital)

VISCEROPTOSIS and atony of the duodenum[1] are predisposing factors for duodenal obstruction, which can be the result of pressure from outside or within the wall of the duodenum or occlusion of the lumen by objects entering the duodenum

Pressure from outside of the duodenum can be due to angulation of the third or preaortic portion by the superior mesenteric vessels, inflammatory scar tissue, congenital or acquired bands or adhesions, pathologic conditions of the head of the pancreas, tumors of the pancreas or tissue around the duodenum such as retroperitoneal tumors,[2] calcified *mesenteric glands,*[3] *cholecystitis,*[4] *nodular cirrhosis,*[4] carcinoma of the colon,[4] partial volvulus of the ileum twisting the jejunum at the level of the ligamentum Treitz,[5] or anomaly of the curvature or rotation of the duodenum Pressure within the wall of the duodenum is caused by tumors, which are quite rare

Occlusion of the lumen of the duodenum may occur from large gallstones or blocking by food of a partial congenital or acquired stenosis[6]

Among the causes of the obstruction of the intestine by external compression Wangensteen[7] mentions also hydronephrosis Hydronephrosis as the cause of the obstruction of the duodenum has not been mentioned in the literature, which fact initiated the idea of reporting our case

Case Report

M Z (History number 141009), a 49-year-old Armenian man, a bootblack, was admitted to Lincoln Hospital on February 12, 1945, with three weeks' history of progressive vomiting after meals For four days prior to admission the patient was not able to retain any food, became weak, and lost approximately 15 to 20 pounds in weight Past history is irrelevant

Physical examination revealed a white man who appeared chronically ill, dehydrated, and emaciated Temperature was 98 8 F , pulse 80, respiration 16, and blood pressure 86/60 The skin was deeply pigmented Examination of eyes, ears, nose, throat, and neck revealed no abnormalities There was moderate bulging over the right posterior chest wall on sitting The lungs were clear to percussion and auscultation The heart was of normal size, with normal sounds and rhythm The abdomen was slightly distended throughout, with no tenderness present The liver edge was not palpable There was a definite mass in the right upper quadrant of the abdomen which percussion showed to extend five fingerbreadths below the right costal margin

On the abdominal wall there was a healed right paramedian incision (postappendectomy scar) and bilateral inguinal hernioplasty scar Rectal examination revealed no masses or other abnormalities Neurologic examination revealed equal but hypoactive reflexes

Laboratory Findings —Urine specific gravity, 1 015, acid, albumin, 2+, 1 to 2 white blood cells per high power field, urate crystals Subsequent examinations revealed no albumin and the white blood cells per high power field varied up to 10 Blood nonprotein nitrogen, 66, blood urea nitrogen, 42 6, sugar, 92, albumin, 3 3; globulin, 3 3, total proteins, 6 6, icterus index, 6 5, cephalin flocculation, 2+ Subsequently the nonprotein nitrogen came down to 38 5 and on March 5, 1945 to 33, at which time the albumin was 3 5, globulin, 2 8, total proteins, 6 3, icterus index, 11, cephalin flocculation, 4+ Blood culture did not show growth in ten days The Klein test of blood was negative. Red blood cells, 2,950,000, hemoglobin, 65 per cent, white blood cells, 5,200, of which polymorphonuclears were 79 per cent, lymphocytes, 12 per cent, cosinophils, 2 per cent, stabs, 7 per cent Gastric analysis showed a hypoacidity

A gastrointestinal series (Fig 1) revealed the stomach to be normal in size and shape, however, it seemed low in the abdominal cavity The duodenal cap was distorted and flattened Six-hour, twenty-four-hour, and even ten-day films showed large retention of the barium meal in the stomach (Fig 2) An intravenous pyelogram failed to visualize the right kidney Cystoscopic examination revealed the bladder contents to be grossly cloudy and the bladder moderately injected The orifices were normal in size, shape, and position A catheter was introduced to the renal pelvis on the left side On the right side it could not be passed beyond 3 cm , at which point a definite obstruction was present Retrograde pyelogram showed obstruction at the lower end of the right ureter

During the course of observation in the hospital, a large cystic mass, not tender, occupying the entire right upper quadrant of the abdomen and right lumbar gutter became more definite The patient vomited if fed orally He was given intravenous fluids—glucose in saline, amino acids, and whole-blood transfusions On March 9, 1945, after a thorough preoperative preparation with fluids as noted, the patient was operated upon An oblique incision, extending from the twelfth rib near the angle downwards and forwards towards the crest of the ileum, was made The abdominal wall was very thin, on cutting through the muscular structures, the large cystic tumor mass presented itself By careful palpation this mass was found to extend from the diaphragm and under the surface of the liver above to the pelvis below and medially beyond the vertebra It was noted that the large vessels, duodenum, and stomach and small bowel were pushed toward the left side of the abdomen A large trocar was inserted into the cystic mass and, with aspiration, about 4,000 cc of dirty, grayish fluid was removed There was a large amount of debris There was a complete collapse of this extensive mass and by blunt manipulation the entire wall of a hydronephrotic kidney was easily separated from the surrounding structures and peritoneum The entire ureter down to the brim of the pelvis was removed with the mass after doubly clamping, cutting, and ligating the ureter, the renal artery, and vein. The cavity was packed with a large square of rubber

FIG. 1 Roentgenogram showing the duodenal cap distorted and flattened

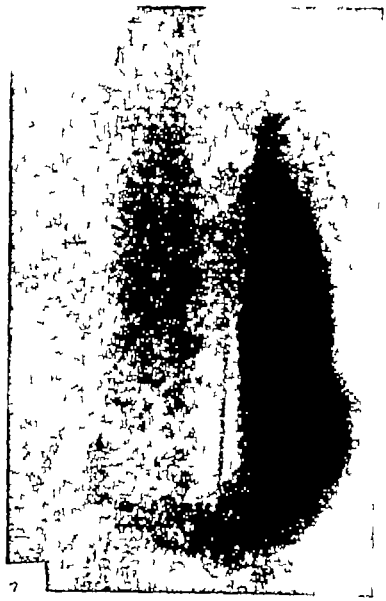

FIG 2 Roentgenogram showing large retention of the barium meal in the stomach

tissue and gauze Muscle structures and skin were sutured in anatomic layers *per primum*.

Pathologic Examination.—Dr J G Sharnoff performed an examination which showed the specimen to consist of a kidney which had been converted into a huge sac. Normal kidney structures could not be made out. The lumen contained a small amount of purulent material. Microscopic sections revealed the pelvis, the epithelium of which was partly eroded The muscular coat showed marked fibrosis, it was also diffusely infiltrated by lymphocytes and plasma cells. The diagnosis was chronic pyelonephritis and hydronephrosis.

On the fourth postoperative day, the patient tolerated a soft diet and the following day a regular diet. He had a smooth postoperative course with the exception of low-grade fever, which varied between 99 and 100 5 F There was a slight purulent discharge from the drain site, and on March 19 1945 the patient was given penicillin a total of 1,250 000 units. On the nineteenth postoperative day the patient developed an itching urticaria-like rash over his body and extremities. With the discontinuation of penicillin, the itching and the rash cleared up in four days. On March 31 1945 there was a definite foot-drop noted with some atrophy of the muscles of the right leg which cleared up in about two weeks. The cause of this was unknown

Followup gastrointestinal series (Fig 3) showed the stomach low in the abdominal cavity but normal in size and shape. The duodenal cap was well visualized as compared to the previous films and the twenty four hour film showed the stomach to be empty

On April 19 1945 or the forty-first postoperative day the patient was discharged in good general condition with a residual sinus tract present measuring only 1½ by ½ cm. in diameter The patient gained considerable weight and was able to eat and retain the general diet without difficulty

Discussion

Among the leading symptoms of duodenal obstruction are recurrent waves of nausea, early vomiting, regurgitation of food, pain in the epigastric region referred to the right costal border, weakness, and weight loss. Many of these patients have thin chests and long waists and show typical habitus enteroptoticus.[4] If the obstruction is near the pylorus and above the ampulla of Vater no bile will appear in the stomach content. Blood studies usually reveal a sharp fall in chlorides and a rise in urea.

In our case the progressive vomiting, weakness, and weight loss were the outstanding or predominant findings.

Obstruction of the duodenum occurred in this case by compression of the greatly enlarged right kidney This is more easily understood if we recall that the duodenum has no mesentery and is fixed retroperitoneally Its first part, which begins at the pylorus and ends at the neck of the gallbladder, is somewhat movable. The descending part is fixed to the front of the right kidney in the neighborhood of its hilum, posteriorly to the right side of the vertebral column to the level of the lower border of the body of the third lumbar vertebra[3] (Fig. 4) It is

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL *The members of the committee are Oliver W H Mitchell, M D , Chairman, (428 Greenwood Place, Syracuse), George Bachr, M.D , and Charles D Post, M D*

Cancer Teaching Day in Jamestown

MEMBERS of the Erie, Chautauqua, and Cattaraugus County medical societies will attend a cancer teaching day to be held on Thursday, February 28 at the Hotel Jamestown, in Jamestown The Erie, Warren, and McKean County medical societies in Pennsylvania have also been invited to attend the meeting

The program of the day will begin at 2 30 P M with Dr Robert E Storms, president of the Medical Society of the County of Chautauqua, presiding The speaker of the afternoon will be Dr Louis C Kress, director of the State Institute for the Study of Malignant Diseases, in Buffalo His topic will be "What the Public Should Know About Cancer"

Dr Frederick R. Weedon, president of the Jamestown Medical Society, will be chairman of the scientific session which will begin at 8 00 P M that evening He will introduce Dr Clyde L Randall, professor of gynecology, University of Buffalo School of Medicine, and Dr Samuel J Stabins, assistant professor of surgery, University of Rochester School of Medicine and Dentistry Dr Randall will discuss "Malignancies of the Uterus," and Dr Stabins will speak on the subject, "Cancer of the Breast"

A dinner will be served at 6 30 P M at the Hotel Jamestown

The following are the committee members arranging for the teaching day Public Health Committee, Drs O T Barber, C E Goodell, and Van S. Laughlin, Program Committee, Drs H A. Blaudell, G W Cottis, W G Hayward, and E J Kelly, Jr

The program is being presented under the auspices of the Medical Society of the County of Chautauqua, Jamestown Medical Society, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control

Common Diseases of Older People

THE Diagnosis and Treatment of Common Diseases of Older People" was the subject of a lecture given by Dr Wardner D Ayer to the Ulster County Medical Society on February 6 Dr Ayer is professor of clinical medicine at Syracuse University College of Medicine, Syracuse, New York. The meeting, arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, was held at the library of the Kingston Laboratory, Kingston.

Laboratory Tests in the Practice of Medicine

DR. RALPH G STILLMAN, assistant professor of medicine at Cornell University Medical College, New York City, gave a lecture to the members of the Rockland County Medical Society on January 25 in the Recreation Pavillion, Summit Park Sanatorium, Pomona

His subject was entitled "The Use and Interpretation of Laboratory Tests in the Practice of Medicine"

This instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York

---

PIGEONS FIND DEFENDERS IN MEDICAL PUBLICATIONS

Declaring "sensational, irresponsible, speculative newspaper publicity" against pigeons as disease carriers lacks scientific basis, the *American Medical Association News* cited a November 17 editorial in the *Journal of the American Medical Association* which branded antipigeon compaigns as ill-founded

Quoting the editorial, the publication asserted that "until statistics in any city present conclusive evidence that human infections due to exposure to pigeons in the streets and parts are fairly common, such action is not warranted" Only a relatively small percentage of all pigeons are "open" carriers, that is, capable of excreting virus in any form which might infect other pigeons or humans

The diseases latent in pigeons may be transformed into clinical infections when the birds are crowded into lofts or cages, it continues, declaring

"Therefore, lofts in back yards or receiving pens for racing pigeons are much more likely to be foci for dissemination of infectious material than are the wild pigeons in city parks and around public buildings

"Danger to the human being comes from intimate contact with pigeons, such as occurs when cleaning dirty lofts or when standing close to cages in which racing pigeons are received It is possible for a human being to become infected from inhaling virus in dusts of streets or parks However, actual studies seem to show only an exceedingly few cases that may have developed in this manner"

The article concludes with the opinion that trapping the pigeons does not guarantee other pigeons will not reinvade the areas, or that their removal will minimize the danger of viruses from other birds

A Fundamental Approach
TO SULFUR METABOLISM

HYDROSULPHOSOL

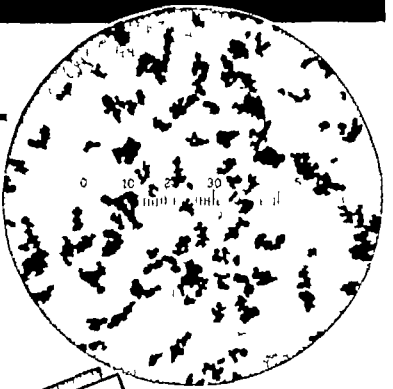

Illustration showing flowers of sulfur magnified 82X small divisions = 10 microns. The size of the colloidal sulfur particle in Hydrosulphosol is estimated at 1/1000 of a micron or 1/10,000 of the small division particle illustrated.

A true solution of sulfur bearing compounds resulting solely from the reduction of flowers of sulfur by a catalytic process. In aqueous solution, it is capable of releasing its unusually high concentration of sulfhydryl ion in readily utilizable form without evidence of toxic reaction.

Its therapeutic importance may best be evaluated by the fact that the —SH radical of the cysteine forms the active group in glutathione, alone of reported importance in connection with tissue oxidations.

Hydrosulphosol is indicated in the management of burns, ulcers and pathological conditions in which sulfur metabolism is a clinical consideration.

Department of State Medical Insurance Plans

CONDUCTED BY GEORGE P FARRELL, DIRECTOR, BUREAU OF MEDICAL CARE INSURANCE

Report of Present Plans on a State-wide Basis

IN CONSIDERING the above problem there are three different methods of approach

1 Amalgamation of all the present plans in New York State to offer a uniform contract

2 Establishment of a new organization by the Medical Society of the State of New York to offer a uniform contract on a state-wide basis

3. Consideration to be given to a uniform contract with minimum benefits, to include in-hospital surgical-medical care by all present existing plans

The primary consideration in offering a contract on a state-wide basis would be whether it should be indemnity or service At the present time the following contracts are being offered

Western New York Medical Plan, Inc , Buffalo A surgical contract including obstetrics, on an indemnity basis (medical rider providing house, office, and hospital calls was discontinued as of November 1, 1945)

Central New York Medical Plan, Syracuse Medical-surgical contract including obstetrics, providing for house, office, and hospital calls for medical care, on an indemnity basis

Medical and Surgical Care, Inc , Utica Surgical care, including obstetrics, on an indemnity basis Dependents receive one half of benefits for surgical procedures Limited medical-expense benefits (20 8 per cent are enrolled under this contract)

United Medical Service, Inc , New York City Two classes of contracts—indemnity and service Indemnity provides for surgical care, including obstetrics, while hospitalized The service contract provides (1) in-hospital surgical care, (2) in-hospital surgical and medical care, (3) general medical expense, including surgical and obstetrics, general medical care in the home, hospital, or physician's office

As of November 30, 1945, 90 per cent of all contracts issued were of the indemnity class

Genesee Valley Medical Care, Inc , Rochester Surgical contract, including obstetrics, on an indemnity basis

The plan proposed for the Capital District, Albany, is a service plan providing in-hospital surgical-medical care Jefferson County Medical Society has tentatively arranged to affiliate with Medical and Surgical Care, Inc , of Utica. The Chautauqua County Medical Society is considering the possibilities of affiliating with Western New York Medical Plan, Inc If, however, they should form their own plan, it is proposed that it be an in-hospital surgical-medical care plan

In reference to the amalgamation of all the present plans in New York State to offer a uniform contract, the foregoing résumé indicates that many changes would have to be made regarding present types of contracts and benefits offered by each plan. Due to the length of time and experience of each individual plan now in existence, consideration would also have to be given to their present financial setups There is a wide variation in surplus of individual plans, ranging from about $2 25 per member to zero In other words, the surplus of some plans is equivalent to the average cost of about seven months of medical care, while others vary to zero

It would be necessary to have complete agreement among all existing boards of directors of each individual plan, regarding the adjustment of surplus in relation to membership The consent and cooperation of all participating doctors would have to be obtained, because of their underwriting responsibility to each individual plan

In reference to method two, the following problems would have to be considered (*1*) necessary change in the present Insurance Law (Article IX-c) to permit organization of a plan on a state-wide basis, (*2*) establishment of a proper administrative setup to make a state-wide plan function This could be accomplished independently or in cooperation with presently existing medical plans. If administered independently, it would require substantial capital and a large personnel, and in practice would be functioning as an independent insurance company

In reference to method three—consideration of a uniform contract which could be offered by existing plans within the state, it is my opinion that the past experience of plans in the state and also in other states should be gathered and analyzed. After such an analysis has been made it would then be possible to offer a plan which would be financially sound and meet the average costs of catastrophic illness It suggested that the Bureau of Medical Care Insurance obtain this information from present plans within the State and from other sources where it is available After a study of this information is tabulated, a uniform contract with minimum benefits (including in-hospital surgical-medical care) can be recommended at the earliest possible date

It is further suggested to study the possibilities of liberalizing enrollment procedures which will give every person the opportunity of enrolling who does not qualify according to some of the present standards set up by the plans

It is also hoped that greater interest and cooperation will be shown by the doctors in supporting present prepaid voluntary medical-care plans operating in their respective areas, also, steps should be taken to get the cooperation of all county medical societies which are not supporting their respective plans In some areas doctors are supporting the operations of mutual benefit associations which tend to retard the progress of voluntary plans

It is my understanding that these associations do not come under the supervision of the State Department of Insurance Where a mutual benefit association does not provide at least a minimum of protection, as provided by the local medical-care plan in that area, I feel that whatever steps are necessary to discourage the participation in such a program by the doctors should be considered

The problem of a state-wide plan has been discussed with the presidents of the four operating plans in New York State, and it is their feeling that present plans should be left to operate in their respective areas, because the rates and benefits offered by each plan apply to the particular needs of the people in that area Indemnity schedules

[Continued on page 424]

. . . FOR THE "LET-DOWN" FEELING

THAT OFTEN COMES WITH YEARS

FREQUENTLY the lassitude and "let-down" feeling of the elderly patient is attributable in some measure to simple hypochromic anemia

In these cases, physicians find Ovoferrin a hematinic of value combating the anemia, helping to raise the hemoglobin level, without the undesirable side-effects to which elderly patients are sensitive. No digestive disturbances, no constipation. Ovoferrin is pleasant to take, palatable, odorless. Stimulates appetite Doesn't stain teeth or injure tooth enamel.

Non ionizing, Ovoferrin enters the gastro-intestinal tract as a fully hydrated oxide in colloid state. Provides needed iron protein in readily absorbable and assimilable colloidal form.

A valuable hematinic in nutritional anemias, in convalescence, in debility states, in pregnancy, in adolescence.

Available at drugstores in 11 oz. bottles. Dosage One tablespoonful in water at mealtime and at bedtime.

HOW OVOFERRIN ACTS IN THE BODY

In the mouth Pleasant and palatable, Ovoferrin is almost tasteless. Doesn't stain teeth or destroy tooth enamel.

In the stomach...Ovoferrin is stable, non irritating Non-ionizable, its colloidal structure remains practically unchanged by gastric juices. Passes on ready for further assimilation.

In the intestine Entering here in colloidal form Ovoferrin iron is readily absorbed utilized. A stable hydrous oxide that has neither dehydrating nor astringent action. No distressing side-effects, no constipation

Colloidal Iron vs Ionizable Iron

OVOFERRIN is non-ionizing, easily assimilable colloidal iron protein.

IRON SALTS may ionize in the stomach, dehydrate and constipate.

OVOFERRIN

COLLOIDAL ASSIMILABLE IRON

MADE BY A C BARNES CO NEW BRUNSWICK N J

[Continued from page 422]

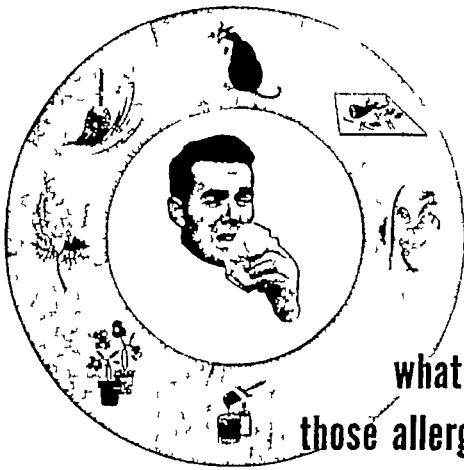
are established to conform with the average charges for services rendered by doctors in areas served by individual plans Community interest would be lost in a state-wide plan

They feel, however, that a contract offering minimum uniform benefits might be practical and the rates and fee schedule could be adjusted according to area It is the consensus of opinion also that the plan can be administered more economically and effectively through present methods. It can be noted here that the Blue Cross Plans, for the past several years, have been attempting to establish a uniform contract throughout the state but have been unable to do so for the reasons outlined in this report relative to medical care

---

DECELERATION IN MEDICAL EDUCATION

Since September, 1941, the medical schools of the United States, by operating on a nine-month schedule, have done their best to meet the dire national need that became clear so suddenly after the attack at Pearl Harbor The same motivation brought about a similar acceleration in the educational programs of our hospitals, where the 9–9–9 plan of rotating internships locked into the medical school schedules, and of our colleges and even high schools, where premedical courses were given There are now two indications that the pressure on this educational system may be reduced the Army has altered its contract with the medical schools in such a way that, until further notice, it will supply only 28 instead of 55 per cent of the matriculants, and the schools themselves are widely adopting the return to an annual period for the matriculation of future classes



These moves on the part of the Army and of the medical schools call for rather prompt adjustments if future difficulties are to be avoided They are not exactly movements in the same direction the Army has reduced the number of its trainees but still calls for their continuous training and the medical schools have reduced the frequency of entering classes but are not yet in a position to return to a twelve-month basis Unless the return to annual admission and a full-year course are made simultaneously and at the time—June—when courses formerly terminated, two things are bound to occur first, for each year that the nine-month curriculum is retained, there will eventually be a delay of three months between medical school graduations, with a maximum of a year, and second, when the twelve-month curriculum is resumed, the teaching schedules for three years will be chaotic This brings up for immediate discussion, and for reasonably prompt decision, the question whether a return to the pre-war timing of the curriculum is desirable

This question has several phases For the students at the top of the academic ladder, acceleration could be continued with profit and ease These students can acquire in three years, as well as in four, the knowledge demanded, but there are not enough of them to supply the medical needs of the country—even in peacetime The students at the bottom of the class in scholastic performance are definitely unable to complete the work satisfactorily in three calendar years, although many of them can do so in three and a half or four years Many of these stable, hard-working students, who can do the work only if they are not hurried, have the attributes of character and personality that enhance their potential usefulness as physicians, and it is altogether proper that such persons be accorded some elasticity and consideration in the planning of the medical curriculum. The great majority of the students, however, stand in between these two ends of the academic ladder they are the common denominators, they set the pace that the others find too slow or too fast, and they determine and maintain the standard at which medical education should be conducted They have been hard pressed by the accelerated curriculum, but they have risen to the occasion and are responsible for whatever success has attended the project

The facts that formerly most medical students devoted some—and a few, all—of their summer vacations to medical pursuits, that the members of the faculties, because of diminishing numbers, have had to give even more time to teaching than that demanded by the nine-month year and that a nine-month internship does not meet the minimum requirements mean that the quality of medical education, other things being equal, must have deteriorated during the wartime acceleration of the curriculum It was an emergency device—"any port in a storm"—but it now appears that the storm has passed sufficiently for us to clear our decks again and to make our ship as stout and as seaworthy as possible We are now planning to train the doctors of 1949 and later

Are we to train them at the highest possible level and to meet the national and international responsibilities that we are now assuming? Before this question can be answered the time elements involved in the accelerated programs of our medical schools must be thoughtfully scanned by the medical, military, and educational authorities of the Nation The simplest method of deceleration would be to return to the annual type of curriculum and simultaneously to extend the 9–9–9 into a 12–12–12 plan for hospital internship In the natural course of events this would bring about a gradual, not a sudden, return toward normal. If these changes were to be made effective as of June, 1945, the future classes to graduate from our medical schools would have the following medical-school increments, including vacations class of 1945, thirty-six months, class of 1946, thirty-nine, class of 1947, forty-two, and class of 1948, forty-five Furthermore, each graduate would have at least a twelve-month internship

Continuation of the nine-month curriculum beyond June, 1945, can be justified only by two considerations first, that there are values in the accelerated program that should be projected into peacetime and, second, that the national emergency is still acute enough to sacrifice quality for quantity in medical-school output in 1948 and 1949 Furthermore, if the latter consideration does hold, it seems likely that both the Army and the country in general would be benefited if the required number of physicians were obtained by increasing the percentage of Army matriculants rather than by retaining the accelerated schedule —*New England J M*

what excites those allergic symptoms?

Child Study Association of America to Meet in New York City

THE Annual Conference of the Child Study Association of America will be held on March 4 at the Hotel Roosevelt, New York City

The subject of the conference is "Education—The Family's Stake in Its Future"

The first session will be a discussion of mental hygiene aspects, Austin MacCormick will preside

Among the speakers will be Brig Gen William C Menninger and Dr Loretta Bender

A symposium, entitled "What Kind of Schooling for the Future?" will take place at the afternoon session

Dr Ernest Melby, Raymond Walsh, and James Marshall will be the speakers

Two Doctors Win Lasker Awards

DR. ROBERT LATOU DICKINSON, of New York City, a leading gynecologist and obstetrician, and Dr Irl Cephas Riggin, Virginia State Health Commissioner, have won the $500 Albert and Mary Lasker Foundation awards for the most significant contribution to research in human fertility and for meritorious public health service, it was announced on January 17

American Urological Association Announces Essay Contest

THE American Urological Association offers an annual award "not to exceed $500" for an essay (or essays) on the result of some specific clinical or laboratory research in urology The amount of the prize is based on the merits of the work presented, and if the Committee on Scientific Research deem none of the offerings worthy, no award will be made

Competitors shall be limited to residents in urology in recognized hospitals and to urologists who have been in such specific practice for not more than five years All interested should write the Secretary, for full particulars

"The selected essay (or essays) will appear on the program of the forthcoming meeting of the American Urological Association, to be held at the Netherland Plaza, Cincinnati, Ohio, July 22 to 25, 1946

Essays must be in the hands of the Secretary, Dr Thomas D Moore, 899 Madison Avenue, Memphis, Tennessee, on or before July 1, 1946

County News

Albany County

Several Albany County physicians have received their honorable discharges from the armed services and have resumed their private practice of medicine They are Drs George B Randall, James A Moore, and John Judge Powers, who have returned to Albany, and Dr Nathaniel Flater, who returned to Latham *

Bronx County

The regular meeting of the county society was held at the Concourse Plaza Hotel at 8 30 P M on January 16 The program consisted of a discussion on group practice by Drs Dean A Clark, director of the Health Insurance Plan of Greater New York, and William B Rawls, chairman of the Coordinating Council of the Five County Medical Societies General discussion followed

• • •

Lt Col Joseph Sante Diasio has received his honorable discharge from the Army after serving since January 29, 1941 He was sent overseas in February, 1942, and served as chief of medical service in a station hospital in the Southwest Pacific theater Since his return to the United States in October, 1944, Colonel Diasio has served as cardiologist and chief of the Officers' Medical Processing Section of the Separation Center at Fort Devens, Massachusetts

Broome County

A joint meeting of the Broome County Bar Association and Broome County Medical Society was held in the Spanish Ballroom, Arlington Hotel, on Thursday, January 17, 1946

Mr John Kirkland Clark, one of the leaders of the New York Bar, president of the New York State Board of Bar Examiners and past-president of the Society of Medical Jurisprudence, discussed the qualifications of medical experts, the preparation of cases with medical expert testimony, and trial technics

Chautauqua County

At the regular meeting of the Chautauqua County Medical Society, held on December 19, 1945, the following were elected to office president, Robert E Storms, Westfield, vice-president, F P Goodwin, Jamestown, secretary, Edgar Bieber, Dunkirk, and treasurer, C E Hallenbeck, Dunkirk

Chemung County

Maj Norman C Gridley, of Horseheads, has returned from the service and soon will resume his practice He was the first practicing physician in the county to enter active service in the war *

Columbia County

Dr Raymond Byron, of Philmont, has arranged to reopen his office for the practice of medicine, which was interrupted while he served in the armed forces overseas as a major *

Dutchess County

The following is a list of elected officers of the Dutchess County Medical Society president, Dr George J Jennings, vice-president, Dr James J Toomey, secretary and treasurer, Dr Albert A Rosenberg, associate secretary-treasurer, Dr J J McGrath, and board of censors, Drs Aaron Sobel, L E Cotter, M Morrison, C B Dugan, delegate,

• • •

Dr Thomas S White, recently discharged from the United States Army Medical Corps, reopened his office in Millbrook on December 26

Dr White is an attending physician at Sharon Hospital and on the staff of Vassar Brothers Hospital *

Erie County

Officers elected by the county society for 1946 are president, Dr Porter A Steele, first vice-president, Dr Arthur F Glaeser, second vice-president, Dr E Dean Babbage, secretary, Dr Louise W Beamis, treasurer, Dr Roy L Scott, committee chairmen—board of censors, Dr Eugene M Sullivan, legislation, Dr Werner J Rose, economics, Dr John C Brady, public health, Dr John W Kohl, membership, Dr John Burke Delegates to the State Society are Drs A H Aaron, Harold F R Brown, Harry C Guess, and Nelson W Strohm, and the alternates are Drs John T Donovan, George H Marcy, Norman C Bender, and Walter Scott Walls

• • •

Commissioner William P Fisher, of the Erie County Department of Charities and Corrections, recently announced appointment of Dr William H Handel as county physician

Dr Arthur R. Gibson, who held the post, declined reappointment because he found the position demanded more time than he could give it under a reorganization plan adopted by the supervisor This coordinates all branches of the county medical and nursing services under one head *

• • •

Dr Emil J Markulis received his honorable discharge from service at Fort Lewis, Washington, November 10, 1945 and arrived home soon thereafter He has resumed his private practice in Orchard Park.*

Franklin County

Capt Robert Henderson has returned to Malone to resume his medical and surgical practice after three years and four months of service as a medical officer with the U S Army He reopened his practice about January 7 *

Fulton County

The following is the slate of officers for Fulton County for the year of 1946 Dr J F Sarno, Johnstown, president, Dr F S Hyland, Gloversville, vice-president, Dr L Tremante, Gloversville, secretary, Dr M McMartin, and J A Shannon, Johnstown, treasurers, Drs M Donnelly, Gloversville, W R. Grunewald, Mayfield, and F G Calter, Johnstown, board of censors, Dr S Clemans, Gloversville, delegate, and Dr F G Calder, alternate

• • •

County doctors who have received their honorable discharges from the armed forces and have resumed practice are Drs Merol E Brickner, Albert F Goodwin, Herbert C Hageman, Francis S Hyland, R. S Kunkel, Robert K Lenz, Malcolm McMartin, and William Raymond.

Genesee County

The following were elected to office in the county society on December 21, 1945 president, Dr Robert S Jenks, Batavia, vice-president, Dr Sidney McLouth, Corfu, and secretary, Dr Peter J Di Natale, Batavia

Herkimer County

Dr Jere J McEvilly, of Little Falls, has been elected to Fellowship in the American College of Surgeons at a recent meeting in Chicago of the college's board of regents

A member of the staff of the Little Falls Hospital, Dr McEvilly is a past-president of the Herkimer County Medical Society and a member of the Utica Academy of Medicine and the American Medical Association He is consulting surgeon for Pine Crest Sanitarium and surgeon for the New York Central Railroad He has been medical examiner of local schools since 1927 and served for a number of years as vice-president of the board of health.*

Jefferson County

Officers elected by the county society for 1946 are president, Dr Sumner E Douglas, vice-president, Dr Wendell George, treasurer, Dr Lawrence E Henderson, secretary, Dr Charles A Prudhon Drs Prudhon and E W Roberts will serve as delegate and alternate to the State Society, and Drs H G Farmer and J M Rice will serve as delegate and alternate to the Fifth District Branch Committee chairmen will be as follows public relations, Dr H L Gokey, program, Dr. J M Rice, legislature, Dr J T Fowkes, Jr., public health, Dr T S Montague, censors, Dr H G Farmer, medical insurance, Dr G S Nellis, and cancer, Dr M M Gardner

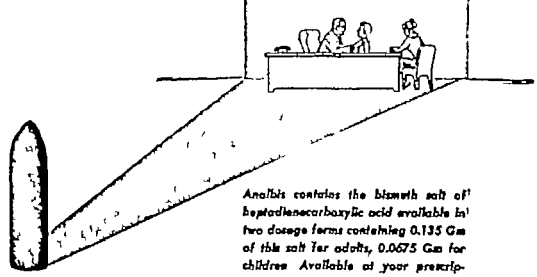
• • •

Dr Grosvenor S Farmer, of Watertown, dean of the medical profession in northern New York and the oldest living graduate of St Lawrence University has reached the age of 96 years

Still in remarkably good health as he approaches the century mark, Dr Farmer is feeling well, is out of doors practically every day and, as has been his habit for years, spends much of his time at the Black River Valley Club He is a charter member and the oldest member of the club *

Kings County

The stated meeting of the county society was held at 8 45 P M, January 15, in MacNaughton Auditorium The program consisted of two lectures "Medical Pessimists and Optimists of 1946," the inaugural address of Dr Thurman B Givan, president of the county society, and "Bacillary Dysentery, Colitis, and Enteritis," by Dr Joseph Felsen, of New York City



• • •

There will be a meeting of the Pediatric Section of the Kings County Medical Society on Monday evening, March 25, 1946 at 8 30 P M at the Kings County Medical Society Building Dr Charles A Janeway will speak on "The Application of Plasma Fractions to the Treatment and Prophylaxis of Diseases of Children."

The Medical Society of Bay Ridge held its bimonthly meeting at Christ Church on December 11

The subject for the evening was "Gastrectomy" Dr Seymour G Clark, associate surgeon, Methodist Hospital, read a paper on that subject He showed very clearly how the mortality by operation for ulcer of the stomach and intestine had been brought down, over a period of four years, from 32 to 1 4 per cent

Dr Charles Williamson, of the Brooklyn Hospital, discussed the paper *

Monroe County

The county society announces that the following physicians have returned from services with the military forces Drs John Fletcher McAmmond, J A Lane, Gustav Rosbasch, John F Kellogg, Jr, George R Bodon, Ralph Jacox, Alvah S Miller, Christopher Parnell, Jr, George P Heckel, Edward Hoffman, Frederick W Bush, Charles Boller, John B Laidlaw, Michael Crino, Leigh Greenfield, and Herbert W Mackowski *

• • •

Dr John Romano, psychiatrist of the University of Cincinnati College of Medicine and director of the department of psychiatry, Cincinnati General Hospital, has been appointed professor of psychiatry at the University of Rochester School of Medicine and Dentistry He will head the new psychiatric clinic to be built this year adjacent to the school's Strong Memorial Hospital

Dr Romano, whose appointment was announced by Dr George H Whipple, dean of the School of Medicine and Dentistry, will assume his new duties June 1, but in the interim will come to Rochester periodically to help with plans for the clinic and for the staff organization A committee of the School of Medicine faculty has been working for nearly a year to select the clinic's director

Cost of the building is estimated at $600,000 and the building cost and an endowment fund of $2,154,000 were donated to the School of Medicine and Dentistry by Mrs Helen W Rivas, of LeRoy

Dr Romano also is director of the Central Clinic, Cincinnati *

Nassau County

County doctors who have recently been given their honorable discharge by the armed forces and have resumed their practice of medicine are Drs Max Tauber, Lynbrook, Harry G Rainey, Great Neck, Jack Lustgarten, Merrick, Ralph Friedman, Freeport, Ralph A Camardella, Malverne, Henry T Graham, Huntington, and Hiram Symon.*

• • •

Dr Samuel J Hollander, Hempstead, instructor in oral surgery for the past twenty years at New York University, was recently elevated from that position to clinical professor of oral surgery

Before becoming an instructor at New York University, Professor Hollander was in practice for many years in Huntington Station *

New York County

The stated monthly meeting of the county society was held at 8 15 P M, January 28, at the New York Academy of Medicine The program consisted of addresses by the incoming and retiring presidents and a lecture, "Bronchogenic Carcinoma," by Dr Alton Ochsner, director of the Ochsner Clinic and professor of surgery at Tulane University School of Medicine Discussion was led by Drs H McLeod Riggins, Samuel A Thompson, and John D Kernan

• • •

Bailey B Burritt, one of the city's leaders in welfare work, was elected president of the New York Tuberculosis and Health Association at the annual meeting of the corporation held on January 22 at the association's headquarters Dr Edward P Eglee was re-elected first vice-president

Other officers elected were Dr Oswald R. Jones, second vice-president, Myron I Borg, Jr, secretary, Harry P Davison, treasurer Elected to the Executive Committee were Drs J Burns Amberson, Kendall Emerson, Jr, James Alexander Miller, Harry S Mustard, and Mrs Ruth Logan Roberts

Dr Carl Muschenheim was elected to the Board of Directors for a term of one year, Frank S Hackett for two years, and William H Biggs and Henry Booth for three years

The fourteenth annual conference of the New York Tuberculosis and Health Association will be held Thursday, March 21, 1946, at the Hotel Pennsylvania

Sessions on various phases of community health and welfare will be conducted throughout the one-day meeting

Election of officers of the Tuberculosis Sanatorium Conference of Metropolitan New York, which will meet simultaneously, also will be held

• • •

A medical art show featuring one hundred and twenty-five paintings and drawings by thirty-five medical artists opened on January 23 and continued through February 12 at the New York Academy of Medicine Sponsored by *Modern Medicine*, the show was free to the public

The exhibit included the work of artists associated with leading schools of medicine, clinics, and hospitals throughout the country Studies of operative procedures, which the medical artist makes as he works beside the surgeon in the operating room, microscopic studies of cancer cells, of eye grounds, and of the human embryo as it develops, are among the exhibits *

• • •

Dr Ernest L Stebbins, New York City Health Commissioner, was chosen on January 11 by the students of Abraham Lincoln High School, Brooklyn, as winner of the Lincoln Award presented annually for outstanding contribution as a citizen of New York.

In the discussion that preceded the election the students cited Dr Stebbins's successful efforts in combating communicable disease, infantile paralysis in particular *

• • •

Dr Eleanor A Campbell was guest of honor at a reception held January 15 at the Judson Health Center, New York City, to celebrate the center's twenty-five years of community service Dr Campbell founded the center a quarter of a century ago, with the late Dr A Ray Petty, pastor of the Judson Memorial Church

Otsego County

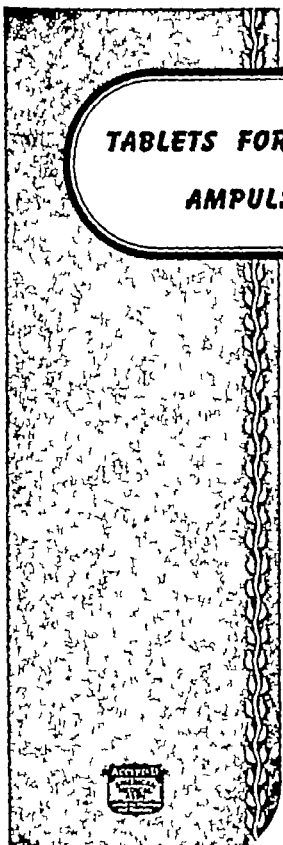
Dr Edward M Wellbery has opened an office in Richfield Springs He formerly practiced in Brooklyn, Waterloo, and Norwich *

• • •

Dr Edward J Keegan has resumed his practice in Oneonta following his honorable discharge from the Army on November 28

Queens County

The Committee on Graduate Education of the county society sponsored, on January 11, a lecture by John Oppie McCall, D D S, consultant in dentistry at New York Hospital, entitled "The Role of Dental Disease in Medicine"



Richmond County

Two historic documents, recovered from a vault where they had lain undisturbed and almost forgotten, were exhibited recently at the annual meeting of the Richmond County Medical Society in the Richmond Health Center, St George

One was the first minute book of the society, created by act of the State Legislature April 4, 1806 The other was a contract dated 1802, which Island doctors signed, fixing a schedule of fees

The contract, which the late Dr James Guyon Clark had put in the vault for safekeeping long before World War I, was presented to the society by Dr Carl Kingsley, who had received it from the Rev Canon Pascal Harrower, rector emeritus of Ascension Church, West Brighton, longtime friend of Dr Clark.

TABLETS FOR *Oral* USE—
AMPULS FOR *Injection*

There has long been a real need for a potent, mercurial diuretic compound which would be effective by mouth. Such a preparation serves not only as an adjunct to parenteral therapy but is very useful when injections can not be given.

After the oral administration of Salyrgan-Theophylline tablets a satisfactory diuretic response is obtained in a high percentage of cases However, the results after intravenous or intramuscular injection of Salyrgan-Theophylline solution are more consistent

Salyrgan-Theophylline is supplied in two forms:

TABLETS (enteric coated) in bottles of 25, 100 and 500
Each tablet contains 0 08 Gm. Salyrgan and 0.04 Gm theophylline

SOLUTION in ampuls of 1 cc., boxes of 5 25 and 100; ampuls of 2 cc., boxes of 10, 25 and 100

Write for literature

new SUPPLEMENT for INFANT DIETS

VI-SYNERAL VITAMIN DROPS

TWO YEAR RESEARCH ACHIEVEMENT

A stable, comprehensive, non-alcoholic, multi-vitamin preparation

Each 0.6 cc. (as marked on dropper) provides . . .

Vitamin A	4000 U.S.P. Units
Vitamin B$_1$	1 Milligram
Vitamin B$_2$	0.4 Milligram
Niacinamide	4 Milligrams
Vitamin C	30 Milligrams
Vitamin D	570 U.S.P. Units

CONTAIN NO ALCOHOL

In 15 cc. and 45 cc bottles with marked dropper

A MODERN FORMULA

Built on Newer Concepts of Infant Nutrition

Milk, both human and cow's, fails to furnish optimum levels of all needed vitamins. Most infants, reports one prominent pediatrician (J.A.M.A. 120:12, p. 183), can benefit from supplementary supplies of Vitamins B$_1$, C, D, Niacin and possibly other B Complex factors as milk, at best, furnishes only the bare minimum of these nutritional essentials.

VI-SYNERAL VITAMIN DROPS help to assure an optimum vitamin intake for infants—at a surprisingly low cost of about 4c per day. The Drops are readily accepted and well tolerated even by very young infants, also suitable for children and adults. Mix perfectly with milk or formula, fruit juices, soups, cereals, puddings.

- **Liberal potencies**
- **Contain no alcohol**
- **Vitamins are stable**
- **Economical**
- **Do not affect taste of foods**

STILL KEEPING A PROMISE

" that Unicaps will always be a good value—an excellent formula at a low price."

POTENCY UP AGAIN

for the fifth time! An increase in potency—the fifth of its kind—continues to keep Unicaps abreast of the latest developments in multivitamin supplementation. Without any increase in price, the new formula of Unicap* Vitamins carries forward the concept of "effective supplementation at unexcelled economy." Because of the potency of the formula and other advantages, Unicaps remain the preference of prescribers, just as their economy makes them the preference of the users. Unicap Vitamins are available in bottles of 24, 100, 250 capsules.

Directory of Approved Surgical Training Plans Published by American College of Surgeons

CHIEFLY as an aid to medical officers returning from war duty, the American College of Surgeons has published a 424-page directory in which are listed and described the approved programs of graduate training in surgery in two hundred and forty civilian hospitals in the United States and Canada, and in thirty-two Naval, seven Veterans Administration, and ten U S Public Health Service hospitals

The total number of approved training plans in the two hundred and eighty-nine hospitals is two hundred and twenty-eight in general surgery and five hundred and twenty-two in the surgical specialties—fractures, plastic surgery, proctology, thoracic surgery, neurologic surgery, orthopedic surgery, urology, obstetrics and gynecology (combined and separately), and ophthalmology and otolaryngology (combined and separately) In these seven hundred and fifty training plans in two hundred and eighty-nine hospitals, approximately two thousand surgeons may be trained, whereas, as the College points out, training facilities for at least five thousand are urgently needed for returning medical veterans whose training in surgery was interrupted by their military service Publication of the directory is expected to stimulate the formation of additional programs of training in suitable hospitals, according to Dr Irvin Abell, chairman of the Board of Regents

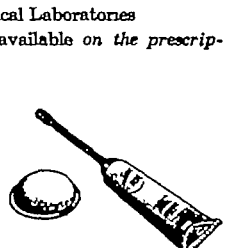
Improvements

There was no delay in plans for postwar improvements at St Luke's Hospital, Newburgh, and December saw the opening of two new laboratory classrooms for nursing students

Two large rooms in the old building, previously used as storerooms, have been transformed into a demonstration room for teaching of nursing arts and an experimental laboratory

Each room boasts the advantages of indirect lighting

In the new laboratory, complete with the latest in equipment, the students do practical work pertaining to biochemistry, anatomy, chemistry, and other biologic sciences *



[Continued on page 440]

AS THE FINAL processing step, Lanteen Jelly is filtered through six fine stainless steel screens, each of 200 mesh—an example of the painstaking control of purity and uniformity maintained throughout production. Control of the efficacy of its products, by latest scientific means, is the constant aim of Lanteen Medical Laboratories

Lanteen Flat Spring Mensinga Type Diaphragm is available *on the prescription of a physician*

Since patients are not mechanically minded, simplicity and ease of handling are prime requisites for continued use. Lanteen Lilac flat spring diaphragm is extremely simple to place—it is collapsible in one plane only No inserter required.

* Asterisk indicates that item is from a local newspaper

The Preference is Overwhelming

A comprehensive report published in *Human Fertility*[1] shows an overwhelming preference by experienced clinicians for the "Diaphragm and Jelly" method of conception control.

The report covering 36,955 new cases shows that the diaphragm and jelly method was prescribed *for 34,314, or 93%*

On the evidence supplied by competent clinicians we continue to suggest that for the optimum in protection the physician should prescribe the combined use of a vaginal diaphragm and spermatocidal jelly

When you specify "RAMSES"* a product of highest quality is assured.

appeared in *Modern Hospital* for January, 1945, shortly after he moved to New York from St Luke's Hospital, Chicago, where he served as medical director for three years Honorable mention certificates were awarded to Dr Edmund E Walker, superintendent, Springfield Hospital, Springfield, Massachusetts, and Jennie F I Dixon, director of social service at Springfield Hospital, for their article "Chronic Disease Ward," published in the June, 1945 issue of *Modern Hospital*

• •

St Albans Naval Hospital has made two hundred beds available to the Veterans Administration to meet the rising demand for medical care of veterans

It is one of a list of hospitals which will supply nine thousand, three hundred and seventy-five beds to the Veterans Administration Space will be borrowed in three thousand, four hundred civilian hospitals for 30,000 patients to break the "bottleneck" in veterans' hospitalization temporarily

The additional beds at St Albans Naval Hospital will only slightly relieve the shortage in the New York area, regional officials at the Veterans Administration said on December 26 *

• • •

Creation of a $25,000,000 medical center in Grover Cleveland Park, Buffalo, disclosed as a possibility in November, appeared a step nearer reality on December 31 with the announcement by President Truman that he had approved the park site for location of a one thousand-bed veterans' hospital

The $10,000,000 institution is to be the nucleus of the contemplated center desired by medical and educational leaders in Buffalo *

• •

Dr Amos O Squire, of Ossining, former chief physician at Sing Sing prison and now chief medical examiner of Westchester County, spoke on "Rotary and Youth" at a meeting of the Rotary Club on January 3 at the Hotel Van Curler, Schenectady *

• • •

The New York Hospital, New York City, has established a transfusion clinic which will allow children with certain types of chronic blood conditions to lead normal schoolday lives while reporting periodically for blood transfusions, Dr Samuel Z Levine, head of the hospital's department of pediatrics, announced on January 1

The clinic was organized experimentally in February, 1944, Dr Levine said, and has demonstrated successfully that young patients may receive the benefits of blood transfusions without hospitalization and consequent disruption of home and school life The six children under 10 years who have been treated by the clinic require 2 pints of blood each month. Since their release from the hospital as ambulatory patients they have received a total of one hundred and seventy-four transfusions, have required no further hospitalization, and have been in regular school attendance *

• • •

As a relief for the acute nursing shortage on Staten Island, a three-story, one-hundred-room training school for nurses will be erected in 1946 by St Vincent's Hospital, West Brighton

According to present plans, the new school will accommodate one hundred nurses, thirty-five students to be admitted each year These young women will have opportunity to enroll in an accredited nursing course and those who complete their training successfully will receive an R N (registered nurse) certificate

• • •

An addition to the U S Veterans Hospital at Bath and conversion of the hospital at Batavia from general to tuberculosis were virtually assured on December 15 through Senate approval of funds for their inclusion in the deficiency appropriation bill

Along with this announcement, Gen Omar N Bradley, Veterans Administrator, disclosed expansion of his bureau's program in New York State, according to a Gannett News Service dispatch

Ten contact offices will be established in smaller Upstate cities, including Auburn, Lockport, and Ithaca, to serve veterans The offices will be under direction of the Veterans Administration center in Batavia General Bradley plans to extend the service to villages, the dispatch said *

• • •

An acute shortage of hospital facilities in the Borough of Queens has prompted the trustees of Jamaica Hospital to plan a $2,300,000 addition to provide three hundred beds, it was announced on November 14 by Clarence A Ludlum, president

With its present facilities the hospital has found it necessary to use sun porches and part of the old dining room for some of its one hundred and eighty-five beds and is still able to provide beds for only eight out of each nine patients

Plans for the new building include the installing of the most modern equipment, the announcement said The building itself will be five stories high with a central bell tower from which the four wings of the building will extend in the form of an X *

• • •

The board of trustees of the House of the Good Samaritan, Watertown, has decided to launch a financial campaign during 1946 to raise $750,000 for the construction of an entirely new and modern hospital building, it was announced on November 30

To remedy crowding at the House of the Good Samaritan, the trustees propose the erection of a five-story building of completely fireproof construction Tentative plans for the new building have already been drawn *

• • •

The National Hospital for Speech Disorders, New York City, is under contract to the Veterans Administration to rehabilitate exservicemen with speech and voice disorders, it has been announced by Dr James S Greene, Medical Director The Hospital is also on the list of approved institutions which veterans may attend under the educational provisions of the "G I bill" More than sixty veterans are already receiving treatment at the Hospital While the majority of the veteran-patients are stutterers, several suffer from aphasia caused by head wounds or from aphonia due to loss of the larynx.

Woman's Auxiliary

To the Medical Society of the State of New York

Message from the President

Dear Auxiliary Members

All of us feel deep regret that hotel conditions in New York City made it impossible to hold our midwinter Board Meeting We all look forward now to the meeting of the Auxiliary at the annual sessions of the Medical Society of the State of New York, which will be held in the Hotel Pennsylvania April 29 to May 3 Every indication points to a difficult hotel situation at that time, too, and I urge every one of you who plans to come to New York to make your room reservation immediately so that you will not be disappointed We hope for a large attendance and I personally look forward to seeing each and every one of you.

Sincerely yours,
ETHEL GRIFFIN

County News

Albany County A meeting of the Auxiliary was held at the City Club in Albany on January 30 The afternoon was devoted to a discussion of medical legislation with special emphasis on the medical indemnity insurance plan

The speakers were Dr John E Heslin, chairman of the special committee appointed to represent the Albany County Medical Society in the investigation of such a plan, and Dr Robert R. Hannon, executive officer of the State Medical Society Dr Hannon discussed the bills pertaining to medicine and public health now before the State Legislature

Kings County At the January 8 meeting of the Auxiliary held at the Academy of Medicine, Dr Thurman Givan, president of the Kings County Medical Society, addressed the members and representatives of other women's clubs on the advantages of the physicians' voluntary medical plan.

Mrs. John L Bauer, chairman, introduced the State President, Mrs Edwin A. Griffin, who also urged all present to publicize the plan

Mr George P Farrell, director of the Medical Care Insurance Bureau of the State Medical Society, explained in detail the comprehensive scope of medical, surgical, and obstetric care under this plan

Dr Frederick Elliott spoke on the topic, "Up-to-the-Minute Compulsory Health Plans"

Mrs Michael M Schultz, of Queens, State Program Chairman, attended the meeting and asked for full cooperation and enthusiasm in presenting the medical-care plan to the public Mrs Alfred L Madden, of Albany, State Chairman on Legislature, urged support of the plan by county members

Nassau County Mrs Louis Van Kleeck presided at a board meeting of the auxiliary to the Nassau County Medical Society in the medical sessions room at Nassau Hospital Monday morning

Members present were the Mesdames George E Christmann, Byron D St John, Arthur D Jaques, Albert M Bell, Nathaniel H. Robin, E Freeman Miller, H S McCartney, Mansoor Moghtader, Louis B Chmielewski, Spencer B Caldwell, and Wilbur G Holz

The auxiliary celebrated its tenth anniversary on January 29 with a party at the Nassau Hospital auditorium Mrs Edwin A Griffin, president of the Woman's Auxiliary to the Medical Society of the State of New York, was the guest speaker Mrs Moghtader, historian, presented a history of the Auxiliary, after which a social hour was enjoyed

The doctors' dinner dance will be held February 23 at the Garden City Hotel, at which time the Medical Society of Nassau County will celebrate its twenty-fifth anniversary

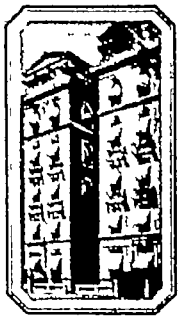
Niagara County On January 14 the Woman's Auxiliary and wives of members of the dental profession were entertained by Dr Arthur N Aitken, medical director of the Niagara Sanatorium, and members of his staff

The guests were served luncheon in the attractive dining room of the Nurses' Home, where special arrangements and decorations were provided under the chairmanship of Mrs Leonard C Evander, corresponding secretary

Mrs Joseph Healy, president, presided at the meeting of members, hospital physicians, and staff assistants.

Dr Aitken welcomed the guests, and Dr Leonard C Evander, senior physician, spoke on the subject, "Rehabilitation and Its Relation to the Community" His talk outlined the program of the hospital in its care of patients, the protection it gives the community, and the tremendous influence the plan in Niagara County is having on similar work being started in hospitals all over the country

A tour of the hospital under the guidance of members of the staff ended an enthusiastic meeting of the Auxiliary



Queens County The Women's Auxiliary to the Medical Society of Queens held a meeting at the home of Miss Lucy Lanza, Long Island City, to complete arrangements for the luncheon and bridge to be held at the Forest Hills Inn in Forest Hills Committee members are as follows arrangements, Miss Lucy Lanza, Mrs Herman Enselberg, Mrs. Samuel Klein, Mrs Daniel Swan, Mrs John Finnegan, and Mrs Charles E Tilley, tickets, Mrs William J Flanagan, Mrs Edward C Veprovsky, Mrs Henry C Eichacker, Mrs John Scannell, Mrs John Keating, Mrs Evan McLave, and Mrs A. J Aptaker, reception, Mrs. Joseph Hallinan, president, Mrs Abraham Braunstein, Mrs Thomas D'Angelo, Mrs Michael M Schultz, Mrs Elmer A. Kleefield, Mrs William Lavelle, Mrs Raymond Murphy, Mrs William Godfrey, Mrs James Dobbins, Mrs Meyeron Coe, and Mrs H P Mencken, special prizes, Mrs J Gibson Hill, Mrs James De Rose, Mrs Henry C Eichacker, and Mrs John Scannell, door prizes, Mrs Walter Steffen and Mrs Walter J Lynch, table prizes, Mrs Harold Foster, Mrs Robert R. Yanover, and Mrs William Brons, card committee, Mrs. George Schmidt and Mrs Miller Sanders

There is a Doctor in the House

—and it took a minimum of $15,000 and 7 years' hard work and study to get him there!

● Proudly he "hangs out his shingle," symbol of his right to engage in the practice of medicine and surgery. But to a doctor it is more than a right. It is a privilege — the privilege of serving mankind, of helping his fellow man to a longer, healthier, and happier life.

According to a recent nationwide survey,

More Doctors Smoke Camels

than any other cigarette

This, too, is Preventive Medicine

For a large segment of our population this postwar adjustment period may present economic difficulties In many such instances the first step toward "cutting down" will be to reduce food expenditures

EFFECTIVE

chemoprophylaxis

of urinary tract infections

SULAMYD (sulfacetimide-Schering) now appears to be the drug of choice for *prophylaxis* of urinary tract infections occurring after surgery of the pelvic organs.

Clinical studies[1] involving four thousand postoperative patients were conducted recently with various sulfonamides and SULAMYD was found most effective reducing the incidence of urinary tract infection to less than one per cent SULAMYD also was found to be less likely to cause renal toxicity than sulfanilamide, and the blockage of catheters with crystals observed with sulfathiazole and sulfadiazine never occurred with SULAMYD

Dosage for prophylaxis of urinary tract infections 0.5 Gm. SULAMYD four times daily

SULAMYD

SULAMYD Tablets (sulfacetimide Schering) 0.5 Gm. in bottles of 100 and 1000

Trade Mark SULAMYD—Reg. U. S. Pat. Off.

Formulac

A NUTRITIONALLY ADEQUATE INFANT FOOD

FORMULAC is the trade-name for a new product—a reduced milk in liquid form—supplemented with sufficient vitamins and minerals to render it an adequate food for infants

FORMULAC was developed by E V McCollum to fill a long felt pediatric need for a milk containing sufficient vitamins and minerals to meet the nutritional requirements of a growing infant *without supplementary administration* The McCollum method of incorporating vitamins into the milk itself eliminates the risk of maternal error or oversight.

FORMULAC, newly introduced on the market, is promoted ethically

FORMULAC, supplemented by carbohydrates at your discretion, presents a flexible basis for formula preparation, readily adjustable to each individual child s needs.

FORMULAC has been tested clinically, and proved satisfactory in promoting infant growth and development. Priced within range of even low income groups, this inexpensive infant food is on sale at most drug and grocery stores.

symptomatic . . . asymptomatic

Barr[1] states " it is just as important to treat properly the symptomless 'carrier' of this parasite as to treat the patient suffering from amebic dysentery "

Stitt, Clough and Clough[2] report, "The disease may be symptomless These mild or symptomless cases have been shown to outnumber greatly the cases with clinical dysentery They constitute the carriers or cyst passers' "

DIODOQUIN (5 7-diiodo-8-hydroxyquinoline) is safe to use even in suspected cases of amebiasis. Nonirritating, nontoxic—Diodoquin has been found promptly destructive to protozoa in amebiasis and Trichomonas hominis (intestinalis)

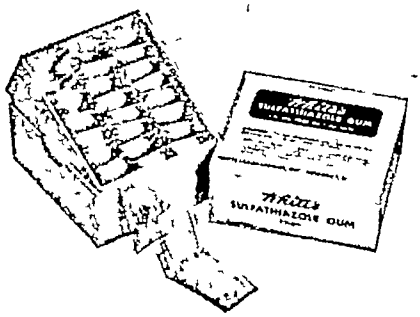
ESKADIAZINE

makes oral sulfadiazine therapy easier

ESKADIAZINE—the ideal oral sulfadiazine—has these three advantages —

1 **Fluid Form.** This new fluid sulfadiazine is the ideal oral dosage form, especially for infants and children, and also for the many adults who object to tablet medication Each 5 cc. (1 teaspoonful) contains 0 5 Gm. (7 7 gr) of sulfadiazine.

2 **Exceptional Palatability** Eskadiazine is so surprisingly palatable and pleasant in consistency that it is accepted willingly by all types of patients Children actually like to take it



3 **More Rapid Absorption.** The findings of a recent clinical study by Flippin and associates (Am. J M. Sc., Aug 1945) indicate that with Eskadiazine desired serum levels may be far more rapidly attained than with sulfadiazine administered in tablet form.

Smith, Kline & French Laboratories, Philadelphia, Pa.

S.K F.'s new, outstandingly palatable fluid sulfadiazine for oral use

"topical

IN A STRICT SENSE OF THE TERM . . ."

White's Sulfathiazole Gum*

IMPORTANT. Please note that your patient requires yo
prescription to obtain this product from the pharmac

" sulfathiazole gum provides a method of chemotherapy for oropharyngeal use and is topical in a strict sense of the term, as shown by the extremely low blood levels of sulfathiazole resulting from intensive dosage with the preparation "

—FOX NOAH, ET AL., EFFECT OF SULFATHIAZOLE IN CHEWING GUM IN CERTAIN OROPHARYNGEAL INFECTIONS, ARCH. OF OTOLARYNGOLOGY 41 278-283 (APRIL) 1945

When a single tablet of pleasantly flavored Sulfathiazole Gum is chewed for one half to one hour it provides a high salivary concentration of locally active sulfathiazole averaging 70 mg. per cent. Moreover, resultant blood levels of the drug, even with maximal dosage, are so low (rarely reaching 0 5 to 1 mg. per cent) that systemic toxic reactions are virtually obviated.

INDICATIONS: Local treatment of sulfonamide-susceptible infections of oropharyngeal areas, acute tonsillitis and pharyngitis—septic sore throat—infectious gingivitis and stomatitis—Vincent's infection Also indicated in the prevention of local infection secondary to oral and pharyngeal surgery

DOSAGE: One tablet chewed for one-half to one hour at intervals of one to four hours, depending upon the severity of the condition

If preferred, several tablets—rather than a single tablet—may be chewed *successively* during each dosage period without significantly increasing the amount of sulfathiazole systemically absorbed.

Available in packages of 24 tablets sanitaped in slip-sleeve prescription boxes

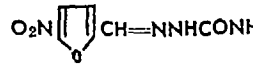
ANNOUNCES

A NEW TYPE

OF



CHEMOTHERAPEUTIC AGENT

Discoveries made in Eaton Laboratories[1] have resulted in the introduction of a new class of antibacterial agents—*the nitrofurans* Over 200 of these have been studied *and give great promise of taking a place in chemotherapy with the sulfonamides and penicillin*

Bacteriostatic and Bactericidal Effects of Furacin

Organisms	Gram Stain	Min. concentration limiting growth to 50% of control in 24 hours.	Min. conc. showing no growth in 4 days.
S aureus	+	1—100,000	1— 80,000

One, especially, of these nitrofurans has proved to be outstandingly effective It has a wide antibacterial spectrum, including many *gram-negative* as well as *gram-positive* organisms It is low in toxicity This compound has been named FURACIN.

5-nitro 2 furaldehyde semicarbazone

During the past four years, Furacin has been widely used in experimental work It has proved effective in many cases where sulfonamides and antibiotics have been unsuccessful. Clinical evaluation is continuing in many important medical centers

This new antibacterial is first presented in the form of FURACIN SOLUBLE DRESSING.

first available in

FURACIN SOLUBLE DRESSING

for treatment of wound and surface infections

INDICATIONS

Based on clinical findings to date, Furacin Soluble Dressing is suggested for topical treatment of

Infected surface wounds, or for the prevention of infection • infections of third and fourth degree burns carbuncles and abscesses after surgical intervention infected varicose ulcers • superficial ulcers of diabetics secondary infections of eczemas impetigo of infants and adults treatment of skin-graft sites • osteomyelitis associated with compound fractures secondary infections of dermatophytoses.

The new chemotherapeutic agent, *Furacin*, is now available in the form of *Furacin Soluble Dressing*, for topical application. This dressing contains 0.2 per cent Furacin in a bland, water-soluble, water washable base.

Furacin Soluble Dressing is bactericidal, both *in vitro* and *in vivo*[2] to many organisms characteristic of surface infections Its antibacterial spectrum compares most favorably with sulfonamides and penicillin. It is free of some of their disadvantages, being stable and relatively unaffected by body fluids.

Furacin Soluble Dressing liquefies at body temperature this aids penetration to all parts of wounds It is non irritating, does not dry or cake and will not retard healing. It is readily removed with sterile water or saline without causing bleeding or injury to granulation tissue.

The index of sensitization is low Nó evidence of systemic toxicity has ever appeared in the hundreds of patients treated.

Your druggist now has Furacin Soluble Dressing in 1 lb. jars for filling your prescriptions.

ERTRON

unlik

any other

antiarthrit

SUPPLIED IN BOTTLES OF 50, 100 AND 500 CAPSULES

PARENTERAL FOR SUPPLEMENTARY INTRAMUSCULAR INJECTION

It is now known that Ertron is unique—differing clinically and chemically from all other drugs used as antiarthritic medication.

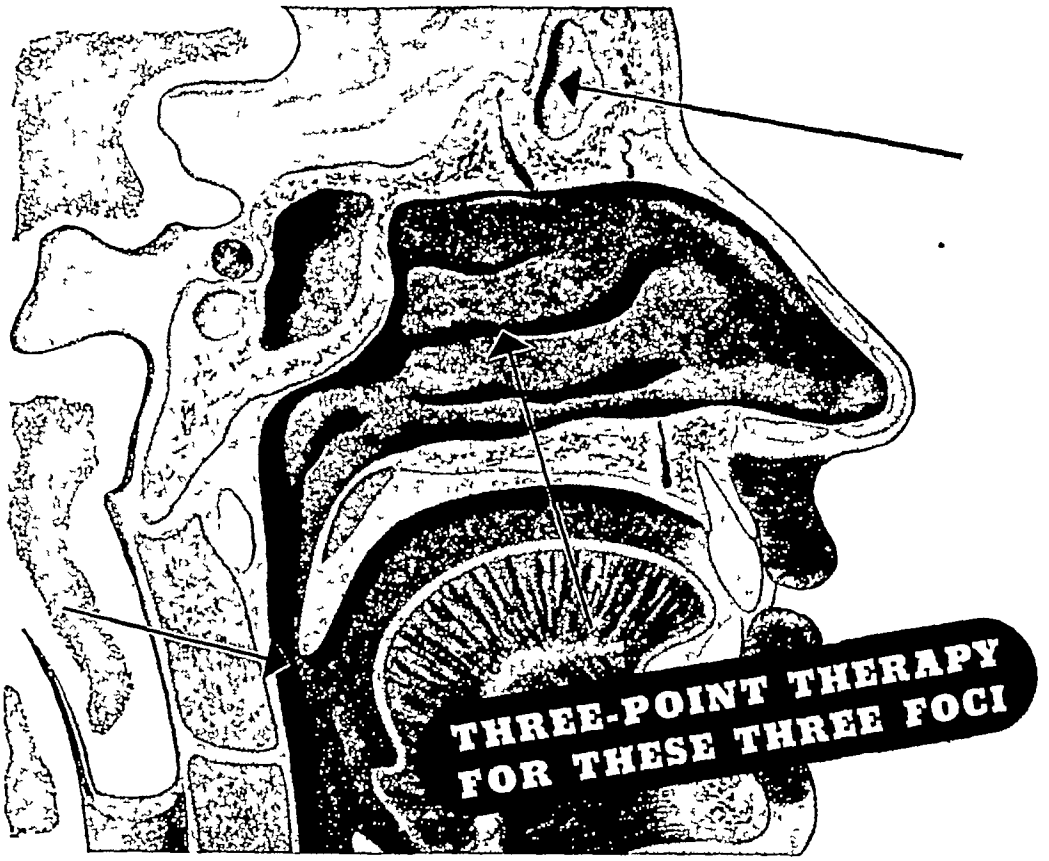
An extensive bibliography, based on 10 years of clinical research, affords ample evidence regarding the effectiveness of Ertron in arthritis.

It can now be stated, on the basis of recent laboratory research, that Ertron is chemically different.

Simply stated, Ertron is electrically activated vaporized ergosterol prepared by the Whittier Process.

Ertron contains a number of hitherto unrecognized factors which are members of the steroid group The isolation and identification of these substances in pure chemical form further establishes the chemical as well as the therapeutic uniqueness of Ertron

Each capsule of Ertron contains 5 mg. of activation products having a potency of not less than 50,000 U S.P Units of Vitamin D



To Ertronize the arthritic patient, employ Ertron in adequate daily dosage over a sufficiently long period to produce beneficial results

The usual procedure is to start with 2 or 3 capsules daily, increasing the dosage by 1 capsule a day every three days until 6 capsules a day are given Maintain medication until maximum improvement occurs A glass of milk, three times daily following medication, is advised

Ethically promoted

Ertron is the registered trade-mark of Nutrition Research Laboratories

NUTRITION RESEARCH LABORATORIES • CHICAGO

IN the treatment of paranasal infection, ARGYROL offers more than effective antisepsis, decongestion without vasoconstriction, and cleansing effect It also provides for stimulation, *synergetically*, of the membrane's inherent, natural defense mechanism

Treatment with ARGYROL is wisely directed to these three foci of paranasal infection

1 the nasal meatus by 20 per cent ARGYROL instillations through the naso-lacrimal duct

2. the nasal cavities with 10 per cent ARGYROL solution in drops or by nasal tamponage

3. the fauces and pharynx by swabbing with 20 per cent ARGYROL solution

How Argyrol Acts on the Membrane

DECONGESTIVE—ARGYROL'S decongestive effect on the membrane is the result of its demulcent, osmotic action The withdrawal of ARGYROL tampons from the post nasal cavities frequently brings forth a long ropy mucous discharge measuring as much as two feet or more

BACTERIOSTATIC—Although proved to be definitely bacteriostatic, ARGYROL is non toxic to tissue In nearly half a century of wide medical use of ARGYROL, no case of toxicity, irritation, injury to cilia or pulmonary complication in human beings has ever been reported

STIMULATING—Soothing to nerve ends in the membrane and stimulating to glands, ARGYROL S action is more than surface action For it acts *synergetically* with the membrane's own tissue defense mechanism

When you order or prescribe ARGYROL, make sure you specify Original Package ARGYROL.

ARGYROL

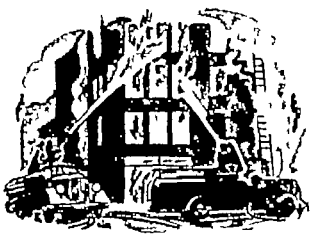
Evolution of the 3rd insulin . . .

A NEW type of insulin is available for the diabetic—Globin Insulin First there was a quick-acting but short-lived form Next came a slow-acting but prolonged type Now there is the intermediate-acting 'Wellcome' Globin Insulin with Zinc Activity begins with moderate promptness yet it continues for sixteen or more hours, sufficient to cover the periods of maximum carbohydrate intake Activity diminishes by night so that nocturnal reactions are minimal



A single injection daily of 'Wellcome' Globin Insulin with Zinc controls the hyperglycemia of many patients Physicians are rapidly learning to take advantage of this new third form of insulin when prescribing for their patients

'Wellcome' Globin Insulin with Zinc is a clear solution, comparable to regular insulin in its freedom from allergenic properties

Accepted by the Council on Pharmacy and Chemistry, American Medical Association. Developed in the Wellcome Research Laboratories, Tuckahoe, New York U S Patent No 2,161,198 Available in vials of 10 cc , 80 units in 1 cc. and vials of 10 cc , 40 units in 1 cc Literature on request 'Wellcome' trademark registered

Third Degree

In severe thermal burns when protein needs far exceed the limits of dietary toleration, Parenamine provides extra-dietary amino acids to restore and maintain positive nitrogen balance and correct hypoproteinemia*

Parenamine

AMINO ACIDS STEARNS PARENTERAL

For protein deficiency

PARENAMINE is a sterile 15 per cent solution of amino acids containing all known to be essential for humans, derived by acid hydrolysis from casein, fortified with pure *dl*-tryptophane

INDICATED in conditions of restricted intake, faulty absorption, increased need or excessive loss of proteins such as in preoperative and postoperative management, extensive burns, delayed healing, gastro-intestinal disorders, fevers, et cetera.

ADMINISTRATION may be intravenous, intraarterial or subcutaneous

SUPPLIED as 15 per cent sterile solution in 100 cc. rubber-capped bottles.

Reprints and complete clinical data will gladly be sent on request

ANNOUNCING POSTGRADUATE COURSES

FOR RETURNED OFFICERS OF THE ARMED FORCES AND PRACTITIONERS

THE UNIVERSITY OF BUFFALO SCHOOL OF MEDICINE

1. THERAPEUTICS: *One Week*

The presentations will be designed to cover the many recent additions in the field of therapy, as well as to review the well established older therapeutic methods and agents

2. MALIGNANT DISEASES: *Four Days*

This course of instruction affords the physician an opportunity to become familiar with the latest developments in the diagnosis and treatment of the various types of malignant disease There will be ample opportunity for the examination of a large amount of clinical material.

3. PEDIATRICS: *One Week*

This course will offer opportunities for not only didactic presentation but actual contact with a large variety of clinical material demonstrating the frequent acute and chronic diseases of childhood

ALL COURSES WILL BE HELD THE WEEK OF MARCH 18th, 1946.

The fee for each course will be $40 00 For catalogue and detailed information address all communications to

8 REASONS WHY
our strained peas are so good !

1 Choice Perfection and Surprise varieties are harvested under Beech Nut supervision when the Tenderometer indicates fullest sweetness

2 Shelled and top iced at the viner station, the peas are brought to the plant within 6 hours of picking

3 To prevent sugars from reverting to starch, immediately after washing, the peas are immersed in scalding water

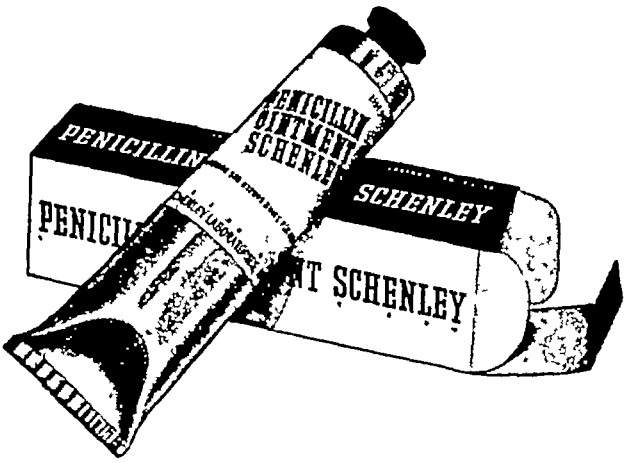
4 All now go into a separator filled with salt solution On the flotation principle, any hard, overripe peas sink and are discarded

5 After another washing, the peas are vacuum pressure cooked in the absence of air

6 Then they are mechanically strained to smooth even texture and put into jars.

7 The filled, vacuum sealed jars are now finally processed in tight retorts

8 Testing both during and after processing, is an important part of Beech Nut s packing technique Tests include total solids, flavor, consistency, and color checks, as well as vacuum retention and pH tests after incubation



The scientifically controlled processing of Strained Peas is typical of the care with which Beech Nut prepares all its Strained and Junior Foods.

AMES COMPANY, Inc., Elkhart, Indiana

THIS IRON STUDY INDICATES THE *Greater Nutritional Yield*

Comparative effects on hemoglobin and erythrocytes of anemic rats. At left, spinach strained and homogenized; at right, spinach merely strained.

THAT the availability and utilization of iron contained in a strained vegetable should become practically 100% greater as a result of homogenization is a noteworthy revelation

This marked difference was demonstrated in laboratory studies of the effects of feeding "merely strained" spinach and "strained and homogenized" spinach to groups of anemic rats. The graph illustrates the response in erythrocyte count and hemoglobin level—twice as great a response in the group fed "strained and homogenized" spinach a Libby product.

By releasing the cell-contained iron and dispersing it homogeneously throughout the food substance, Libby's dual processing of baby foods—first straining and then homogenizing—provides a greater yield of this essential nutrient The fine-textured "bulk" resulting from Libby's exclusive mode of processing presents a greater surface area to the action of the digestive juices. Hence digestion is facilitated, utilization is enhanced.

These advantages are particularly valuable in the aim to forestall nutritional anemia in the infant. They make possible supplementation of the milk diet as early as in the fifth week of life—before prenatal stores of iron become exhausted

Libby, McNeill & Libby
Packers of Quality Foods Since 1868
Chicago 9 Illinois

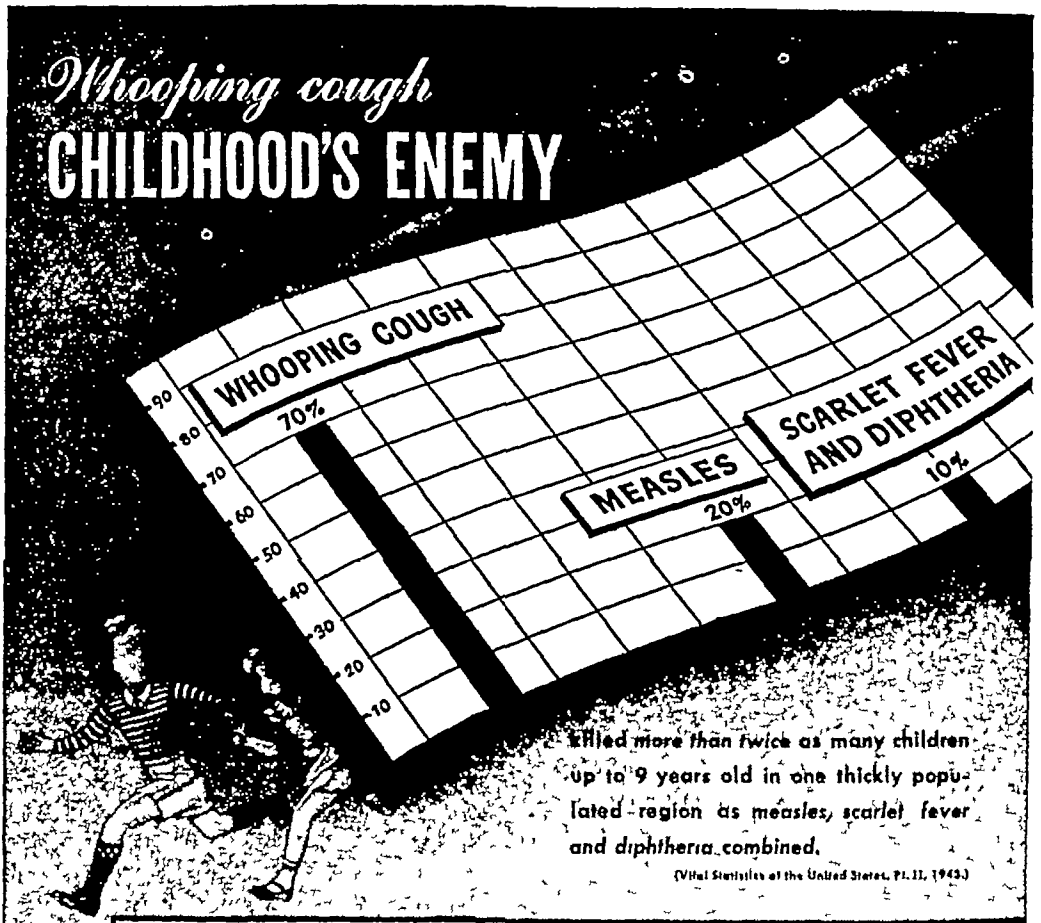
1 Libby s process of homogenizing·

A. Opens cell capsules, releases contained nutriment, and disperses it homogeneously throughout.

B. Comminutes indigestible cell membranes and coarse cellulose fibers.

C. Exposes the nutriment to the digestive juices in a considerably increased surface area, thus facilitating digestion.

D Increases availability of the contained nutrients, thus facilitating utilization.



E. Renders cellulose mechanically bland, without impairing physiologic effect of bulk on intestinal motility

2 Libby's Homogenized Baby Foods may be fed as early as in the second month providing essential nutrients like iron before prenatal stores are exhausted.

3 The smoother texture of these foods enables them, when added to the milk formula, to flow freely through normal nipple openings.

PERTUSSIS ENDOTOXOID-VACCINE

Wyeth

REG U S PAT OFF

SUPPLIED IN VIALS OF 6 AND 24 CC.

A NEW IMPROVED PRODUCT FOR ACTIVE IMMUNIZATION

Contains 15 billion Haemophilus pertussis (phase I) and 150 provisional units pertussis endotoxin per cubic centimeter before detoxification

PERTUSSIS ENDOTOXOID-VACCINE Wyeth is *doubly effective* for prophylaxis because

- Its endotoxoid component stimulates the production of antiendotoxin to neutralize the poison released by H pertussis *
- Its vaccine content provides antibacterial immunity to the invading organisms themselves *

Trials by competent clinical investigators encourage the belief that a high percentage of successful immunizations may be expected *STREAN L.P ET AL CANAD M A.J 45:326 1941

Editorial

The DiCostanzo-Crews Bill
II

In the preceding issue of the JOURNAL we asked for the defeat of the vicious DiCostanzo "antivivisection" bill now pending in the Legislature of the State of New York.

The bill is a stupid attack upon legitimate medical research and development which has produced scientific advancement beneficial to human beings and animals alike Says *PM*,[1] of the New York *Journal-American* campaign for the bill

> The Hearst attack on medical research has been conducted with consummate skill For weeks, the *Journal-American* has given lavish space to hysterical editorials, reader's letters, cartoons, lengthy poems, full-page picture stories, and front-page features depicting dogs in various stages of "torture" in the experimental laboratories of medical scientists portrayed as inhuman monsters
>
> Every device has been used to exploit the average reader's natural sympathy for dogs and other domestic pets All stops have been pulled in turgid appeals to sentimentality Not only antivivisection societies, but Boy Scout groups, fraternal organizations, women's clubs, and schools have been enlisted in the campaign to get up a monster petition for presentation to the Legislature Individuals and groups have been stampeded into writing pressure-letters to their State legislative representatives demanding a favorable vote on the antivivisection bill Hearst, in this strangely anachronistic crusade, has thrown everything at his readers but the facts

However, Mr Hearst and the antivivisectionists have no monopoly of public information, even if they have admittedly a well-developed technic of hysterical distortion and misrepresentation. Respectable newspaper editors in every section of New York State are aroused to action by the misrepresentations and distortions as to research work on dogs which are appearing in the Hearst press They know that if the DiCostanzo Bill passes, future progress of medical science will be badly crippled

Together with the Medical Society of the State of New York, the Friends of Medical Research, a new society formed to inform the public about animal research and its contribution to public health, is aiding in every way to disseminate factual material for the benefit of all, legislators, editors, women's clubs, dog fanciers, in fact any person interested in the truth about animal experimentation.

[1] Vol. VI, No. 179 Jan. 13, 1946.

The Friends of Medical Research was launched under the auspices of the New York Academy of Medicine, Dr Baehr said Among its initial sponsors, he said, are Dr Nicholas Murray Butler, president emeritus, Columbia University, Fiorello H La Guardia, former Mayor of New York, Gerard Swope, former president, General Electric Company, John W Davis, former Ambassador to Great Britain, Vice Admiral Ross T McIntire, Surgeon General, United States Navy, Homer Folks, secretary, State Charities Aid Association, Dr Anton J Carlson, chairman, executive committee, American Association for the Advancement of Science, and Clifton Fadiman, author and critic [2]

As this is written, we learn that Assemblyman Irwin D Davidson has withdrawn from "the calculated hysteria of the current drive for an 'antivivisection' bill in Albany "[3]

Mr Davidson is to be heartily congratulated

Animal experimentation is already governed by law in this state It is conducted as humanely as possible under the auspices of responsible institutions Wanton cruelty is punishable, and if it could be proved that the statutory provisions in this respect were inadequate, or could be strengthened without impairing the ability of science to combat disease, no one could legitimately object to revisions of the code But the present pressure does not depend upon facts, or logic Until it does, the legislators in Albany are justified in resisting every attempt to sacrifice the welfare of men, women, and children to an artificially stimulated sentimentality [3]

Many newspapers, womens' clubs, and scientific and lay societies are coming to the realization of the seriousness of the current attack In reporting the meeting of the Society of Medical Jurisprudence at the New York Academy of Medicine (January 14, 1946) the New York *Times*[2] said, referring to the Friends of Medical Research

Dr George Baehr, president of the New York Academy of Medicine, said the first efforts of the new organization would be directed toward the defeat of the DiCostanzo-Davidson bill in the State Legislature to make research work with dogs unlawful It is intended that this State-wide committee shall be coordinated with similar ones in every county of the State, Dr Baehr said Dr Simon Flexner is honorary president of the new organization

Dr Gilbert Dalldorf, director, New York State Department of Health Laboratories and Research, Albany, said

"It is a serious threat we face in New York and it will require a great effort to defeat it Yet the alternative will seriously impede the growth of biologic science, place a needless handicap on experimentation, and deny to investigators one of the most valuable tools "

Announcement was made that invitations are to be extended to other leaders of public affairs to join the committee of sponsors of the new organization

The Women's City Club of New York added its weight yesterday to the campaign to prevent passage of the DiCostanzo-Davidson bill, which would limit experimentation on dogs in research laboratories in New York "The DiCostanzo-Davidson antivivisection bill is simply an entering wedge," Dr Ethel E Wortis, chairman of the club's committee on public health, said "Once these interested groups have succeeded in keeping scientists from using dogs, they will put all their efforts behind legislation to prevent the use of any animal for purposes of medical research "[4]

In an editorial entitled "Dangerous Nonsense" the *Utica Daily Press*[5] said

The current bulletin of the Utica Academy of Medicine and the Oneida County Medical Society contains an article by Dr F M Miller, Jr , which should be read by every resident of the county It describes the current pressure upon the State Legislature to enact an antivivisection law

This piece of dangerous nonsense has bobbed up at intervals for the past thirty years, and heretofore, the people of New York have had the good sense to reject a proposal that is obviously harmful to them Despite all the lurid tales about vivisection which used to be featured in the sensational press, there is no logical basis for condemning this type of research It has provided medical science with basic information for treatment of *diabetes*, pernicious anemia, diphtheria, blood transfusion, shock and plasma research, to name only a few. The benefits from the latter items alone in treating our wounded during the past war are sufficient to justify all the experimentation

Also, the New York *Sun*,[6] reporting the growing opposition to the proposed "antivivisection" legislation, said in part

[2] The New York Times, Tuesday, Jan 15, 1946
[3] Editorial Dogs or Humans? N Y Herald Tribune, Jan 20, 1945
[4] N Y Herald Tribune, Jan 16, 1946
[5] Monday, Jan 7, 1946
[6] Jan 15, 1946

The Friends of Medical Research was inaugurated by the New York Academy of Medicine, Dr Baehr said, and is backed by the Medical Society of the State of New York and by public health and social welfare organizations Dr Simon Flexner, former director of the Rockefeller Institute of Medical Sciences, is honorary president of the new group

And the *Daily Worker*[1] said also of the Friends of Medical Research in part

The Friends of Medical Research is conducting an educational campaign with various medical and scientific groups to acquaint the public with the facts It was launched by the New York Academy of Medicine and the Medical Society of the State of New York and is backed by outstanding public figures

Last year a similar antivivisection bill almost passed the legislature

Hearst's current drive, which includes a signature campaign to Governor Dewey and the Legislature, has made significant headway, and unless the public is enlightened as to the facts, medical science will be obstructed His campaign, which is being conducted in several states, will be especially harmful in New York, where several of the world's greatest scientific centers are situated

Hearst's own *Journal-American*, on January 18, 1946, said of Assemblyman Davidson's withdrawal from the "antivivisection" ranks

Under the whip of the powerful medical lobby, Davidson ran out on his colleague, Senator Richard A DiCostanzo, whose measure outlawing vivisection of dogs is now before the Senate

Davidson's run-out and his explanation could not stem the impetus of the fight to prohibit the practice of cutting up dogs In a way Davidson could be said to have aided the campaign for he pointed out, if anyone had any reason to doubt it, the extent to which the medical lobby will go

"Was the medical lobby responsible for your change of mind?" Davidson was asked

"No comment," said Davidson

In his statement Davidson placed himself in the position of being against cruelty to animals, in an academic way, and yet being unwilling to do anything about it, despite the trust placed in him by the multitude of men and women who have signed the antivivisection petitions

Mr Davidson quite sensibly stated

I am still committed to the proposition that there shall be no cruel, torturous, or inhumane treatment of any animal, particularly the dog The safeguarding of these pets from pain and suffering is a humanitarian purpose

The manner of accomplishing this purpose without hampering legitimate scientific experimentation, to my mind, warrants further study and consideration.

I have, however, introduced no bill on the subject and intend to sponsor no measure which will in any way hinder or retard the progress of science

It seems to us to be time that such ill-directed campaigns as that of the "anti-vivisectionists" against legitimate medical research ceased To needless cruelty, to animals or humans, nobody, least of all the doctors, would subscribe To waste the time of legislators and many others in efforts of this kind is to render a disservice both to animals and to human beings

It is hoped that the, now, DiCostanzo-Crews bill will be so decisively defeated as to leave no doubt in anyone's mind that the people of the State of New York will not tolerate for publicity stunts, for reasons of mawkish sentimentality, as means of increasing newspaper circulation, any interference with the legitimate, safeguarded use of animals for scientific medical research in which the whole people benefit.

American Journal of Obstetrics and Gynecology

The December, 1945 issue[1] of the *American Journal of Obstetrics and Gynecology* marks the twenty-fifth anniversary of this useful and well-edited journal Succeeding in October, 1920 the *American Journal of Obstetrics and Diseases of Women and Children*, which had a notable career between 1868 and 1919, the new publication under the

editorship of Dr George W Kosmak and his associates has grown in usefulness ever since

Commenting editorially in the anniversary number on the progress in the medical fields served by the *Journal*, Dr Kosmak writes

> The work of these two journals together has covered an uninterrupted period of seventy-seven years, during which the specialty of obstetrics and gynecology has been represented by a monthly periodical devoted exclusively to its interests Seventy-seven years is a long time In this period the specialty has become transformed The diseases of children as covered in the former *Blue Journal* no longer come within the domain of the doctor who confined their mothers Moreover, the distinction between the gynecologist and the obstetrician is gradually disappearing and a great single branch of medicine has developed, formed from this fusion .
>
> During this past quarter of a century, medicine has participated in the revolutionary changes which have affected the entire world We have seen, above all, the effort to make medical advances more available to all of the people, with a resulting expansion of governmental direction and control The extension of direct medical service to a certain group of the people, as exemplified by the Emergency Maternity and Infant Care program, may be but the first of a succession of projects by which maternity care finally is to be provided through governmental funds for any woman who requests it It is understandable that the fields of obstetric and pediatric practice should be the first to receive such attention, for there is a sentimental factor involved in caring for the Nation's mothers and children These special fields may, however, serve simply as an area in which such measures are the first to be tried, and serve as a forerunner, perhaps of the extension of government activity in other branches of medicine Whether such expansion from previous accepted methods will prove either desirable or beneficial is for the future to decide There remains a lingering doubt in the minds of many physicians whether such measures, centrally controlled in the final analysis by a bureaucratic administration in the national capitol and supported by universal taxation, will bring about that practical idea in maternal and infant welfare which we all desire
>
> In these last two and one-half decades of great social, political, economic, and scientific developments, medicine has occupied a leading role Within the domain of the specialty embraced by the *Journal*, signal advances may be recorded Knowledge of the physiology of reproduction has advanced greatly, with the attainment in particular of a knowledge of the role of the endocrines, the morphologic development of the embryo, and the control of uterine contractility Gynecologic and obstetric pathology has become an essential part of the personal knowledge of each practitioner of the specialty The widespread use of blood and plasma has completely altered the outlook in major surgical operations and in obstetric hemorrhage The sulfonamides and penicillin have revolutionized the treatment of infections Radiation has been further developed in the treatment of cancer Finally, the enlistment of the efforts of the practitioner of obstetrics in a great cooperative study has produced a phenomenal improvement in obstetric mortality and morbidity
>
> Of interest is the fact that the mechanical phases of gynecologic treatment show little change while the development of medical and physical methods of therapy and diagnosis has assumed such great prominence While operative technics have been developed and expanded, the scalpel today is less in evidence than the test tube, the experimental and the research laboratory

[1] Vol. 50, No 6

The NEW YORK STATE JOURNAL OF MEDICINE extends its heartiest and warmest congratulations to the *American Journal of Obstetrics and Gynecology* on a long record of notable service in its fields

A County Society Centenary

One hundred years ago the Richmond County Medical Society was created by the Legislature of this State Thus it is one of our oldest and served like others of that early period as a licensing body until this function was taken over by the State itself The society concerned itself with maintaining ethical standards of practice and also

attempted to regulate and standardize fees for services rendered We note in the interesting address recently made by the President, Dr Milton S Lloyd, in which the history of the Society is reviewed most entertainingly, that "services in the capacity of a midwife should be three dollars when paid immediately and four dollars when a charge is made upon the book of the practitioner" But the fee for vaccination was one dollar and fifty cents To the earliest fee schedule, dated 1802, physicians attached their signatures, and English currency denominations still were used, twenty years after the American Revolution.

The current of medical practice is delineated very well in this history of a county society whose members maintained high standards of honor, ethics, and dignity which, to them, seemed of greater importance than the application of the art and science of medicine, for the simple reason that, in those earlier days, there was little of the science of medicine Yet much is revealed in the attitude of those physicians toward the epidemics of yellow fever which repeatedly swept the Island The accepted notion that the disease was due to pollution of the air and the shore by incoming vessels was opposed by the Society's special investigation committee, which, without benefit of the later discoveries of the causative factor, determined that the germs were carried in the clothing of those who arrived in ships "freighted with yellow fever and by employees of the quarantine stations and hospitals who circulated without hindrance among the people"

The esteem in which physicians were held is shown in the life and work of Dr Samuel R. Smith, a public-spirited citizen and a great physician who began his practice in 1828 The Smith Infirmary was named after him, it is now the Staten Island Hospital Dr Lloyd's address is well worthy of preservation among the archives of the Medical Society of the State of New York, and the JOURNAL extends to him as well as to the members of the Richmond County Medical Society felicitations and good wishes upon the completion of their first century of progress

"The Inertness" of Endocrine Substances

The term "endocrines" has acquired a magic sound in the minds of the public, although it is being crowded pretty hard by the vitamins Not only the corner pharmacist but likewise the department store and the beauty parlor have listened to the voice of the commercial siren The advertising copy writers have furthered the campaign through the medium of the press and the radio The public purchases and doses itself with these remedies (sic) without benefit of medical advice or prescription Limiting ourselves for the moment to the endocrines, it must be acknowledged that they have a special appeal. People have been told about the deficiencies associated with disorders of the organs of internal secretion. It seems such a simple matter to overcome the deficiency by swallowing pills made up of the substances which are lacking And so an enormous trade has been built up and little heed given to the warning that many of these preparations are inert or become so after being swallowed, that they are ineffective at best, and that their sale constitutes a fraud on the purchaser Now this is not said to discredit the administration of "endocrines" Some of these have a distinct therapeutic value, but their use must be limited to those of proved efficacy, otherwise the ordinary "sugar pill" of blessed memory is equally efficacious

A word of explanation may be in order E C Hamblin, a recognized authority, states in the introduction to his most recent book, "The Endocrinology of Woman," that the "science" of endocrinology is a "lineal descendant of the most nebulous and fanciful doctrines of the old humoralists." However, during the last century the experimental work of Berthold, Claude Bernard, Addison, and Brown-Sequard transferred some of these fancies into apparent facts, although some of the latter have since been disproved Complex physiologic and chemical investigations have dis-

closed the influence of some secretions of certain glands and organs on the behavior of other groups of cells in the body These are the hormones, the word being derived from the Greek and meaning to excite or arouse In order to accomplish their designated functions they must be in a form not susceptible of disintegration by the digestive juices The latter is what happens to most of these so-called endocrine substances or "extracts" given by mouth, the principal exceptions are the thyroid, pituitary, and suprarenal cortex derivatives The various mammary, orchic, and ovarian "substances," to mention those most freely used, are definitely inert

How to change the attitude of the public and even the doctor's thinking on the subject remains a problem While self-medication persists, as stimulated by advertising through the medium of the press and radio, there is little hope of convincing a gullible public, but the doctor should not be misled and should govern his conduct by the proved fact of the inertness of many of these so-called "endocrine substances" This information is available to him if he will but consult, for example, the "Manual of New and Nonofficial Remedies" published by the American Medical Association If prescriptions and recommendations cease, manufacture will, to some degree at least, likewise cease

Proposals have been made to place these remedies (?) under the ban of the Sanitary Code in local departments of health As a matter of fact, under the federal law endocrine products may be obtained only on prescription The Food and Drug Administration requires that the containers of these products bear a "disclaimer" label, stating that they include no demonstrable therapeutic or active constituents Accordingly, the manufacturers do state on the labels of many of these glandular extracts that "there is no scientific evidence that this product when administered orally possesses any therapeutic activity" or "there is no scientific evidence that the ingredients used in this formula exhibit any physiologic or therapeutic effect" Rarely does the patient or the physician see this "disclaimer" label, usually affixed to the stock bottle It merely prevents the manufacturer from being accused of fraud and both patient and physician are misled Moreover, many of these products are obsolete and although not harmful in themselves, they afford no benefit to a patient who actually may be in need of relief A therapeutic house cleaning may be necessary and an embargo inaugurated by the proper authorities against their sale Such action should not be regarded as a restriction to a physician's independence of action, but rather as a helpful measure to avoid what essentially is a dubious procedure

Current Editorial Comment

Blindness Reportable. The attention of the physicians of the State is called to an announcement on another page of the obligatory reporting of all cases of blindness to the Department of Social Welfare This direction is mandatory and apparently does not permit of any discretionary exemptions and the accumulated data are desired in the efforts being made to correct blindness Compliance with the law is thus essential

Annual Meeting

Hotel Pennsylvania, April 29–May 3, 1946

THE attention of members attending the meeting is called to the fact that all scientific and commercial exhibitions will be available for inspection on Monday and Tuesday of that week, although the meetings of the sections do not begin until Wednesday The motion pictures will also be shown on these days

STUDIES ON THE PROBLEM OF REPEATED MISCARRIAGE

I Genital Hypoplasia

RAPHAEL KURZROK, PH D, M D, New York City

(From the Department of Obstetrics and Gynecology, Morrisania City Hospital)

THE causes of repeated miscarriage are numerous, and we are not always able to state what the cause is in any particular case In the past ten years we have studied several specific causes of repeated miscarriage, namely

1 Abnormalities in sperm morphology
2 Inadequate progesterone metabolism
3 Genital hypoplasia (mainly of the fundus uteri)

The first two will be reported in separate communications Only patients who have miscarried two or more times are included in these studies Patients with fibroids, pelvic inflammatory disease, and acute or chronic illness during pregnancy are excluded in all series

Our results, based on 280 selected cases of repeated miscarriage, led to the following generalizations

(*a*) Semen specimens that showed more than 30 per cent abnormal sperm (total number, motility, semen-mucous penetration, etc being normal) were a very significant cause of repeated miscarriage The probabilities of miscarriage were almost directly proportional to the percentage of abnormal sperm, and that semen specimens showing more than 70 per cent abnormal sperm (based on two or more examinations) resulted in sterility, or in pregnancies that rarely went to term

(*b*) All patients had a premenstrual endometrial biopsy, and during the past three years, four pregnandiol determinations were done during the second half of the same cycle If the biopsy showed inadequate progestational change, or if the pregnandiol values averaged less than 1 mg excreted in twenty four hours, or both, such patients were designated as having an inadequate progesterone metabolism

(*c*) Patients with genital hypoplasia constituted the last group, but occasionally the hypoplasia was complicated by evidence of inadequate progesterone metabolism (9 cases)

The following considerations led us to assume that genital hypoplasia is a cause of repeated miscarriage Several patients were observed who miscarried during their second trimester of pregnancy They were awakened from sleep by spontaneous rupture of the membranes Such contributing factors to premature rupture of the membranes as very recent coitus, hot bath, violent exercise, or a prolonged automobile or train ride were not present. Previous pregnancies had terminated in a similar manner After a longer or shorter interval uterine contractions set in and the pregnancy terminated in spite of sedatives, progesterone, bed rest, etc Neither the placenta nor the fetus presented anything abnormal, and a curettage revealed normal decidua On the contrary, an examination made three months *after* the delivery revealed a hypoplastic genital tract.

We accept the following to be the principal stigmata of genital hypoplasia *

1 The vagina is short and shallow, occasionally long and narrow The fornices are poorly indicated, usually of equal depth and shallow Occasionally the anterior fornix is absent so that the anterior cervical wall and the anterior vaginal wall are continuous

2 The cervix is short, occasionally it is long and conical A scalloped margin is often encountered One side may be shorter than the other

3 The uterus is small This diminished size is due in the main to the lessened amount of myometrium, for the over-all length of the uterus need not be decreased When a diminution in length does occur it does not exceed $^1/_2$ to 1 cm Excessive flexions are not uncommon and occasionally the uterus lies to either one side or the other, as if due to a shortening of either broad ligament.

Hypoplasia of the uterus may be seen in multiparas The hypoplasia may be due to excessive involution of the uterus Lactation seems to play a minor role A history of delayed return of menstrual periods after pregnancy (six or more months), of irregular, infrequent, and inadequate periods should lead one to suspect a uterine hypoplasia.

In order to gain an insight as to how uterine hypoplasia leads to repeated miscarriage, we must consider the so-called "life cycle" of a patient with a hypoplastic uterus Such a uterus is characterized by a lack of competence, that is, a lack of ability to react adequately to normal

* Bernhard Aschner in his *Konstitution der Frau* (Munich, 1924, p. 50) makes the interesting observation that pigment dyscrasias, that is, the combination of blue eyes and dark hair or brown (dark) eyes and light hair is accompanied by a genital hypoplasia. I have carefully checked this observation for many years and believe that it is true in more than 75 per cent of the hypoplasias. The only racial exceptions as a group are the Irish The modus operandi of this strange pigment and genital association is unknown

amounts of estrogens This lack of competence is represented by inadequate myometrial and endometrial morphology and function There are wide variations in the onset of menstruation, ranging from normal to delayed onset The menses may be normal for some years and then various deficiencies occur in amount, time, and duration of flow The patients cease menstruating in the late teens, twenties, or early thirties The greater the hypoplasia the earlier in life do the menses stop This cessation of menstruation is not due to lack of ovarian function, for the vaginal spread remains normal, the amount of estrogen excreted in the urine is within normal limits (Kurzrok and Ratner)[1], and menopause symptoms do not appear until the forties The hypoplasia is, therefore, due to a lack of uterine response to normal (declining) ovarian function As long as the patient is young (15 to 25 years) and ovarian function is at its maximal, this compromised uterus will maintain fairly adequate function With increasing age and diminishing ovarian function (Kurzrok and Smith)[2], a hypoplastic uterus will cease functioning It is our belief that ovarian function is at its maximum in the late teens and early twenties From that point on function decreases (process of aging) until its final cessation The ovaries cannot supply enough estrogen to maintain a compromised organ in adequate function The addition of exogenous estrogens to the endogenous supply of the patient's own ovaries is the basis of our therapy Such restoration may be temporary or fairly "permanent"

This lack of competence is not only expressed in a failure to menstruate adequately but also in difficulties involving fertility, pregnancy, and labor Uterine hypoplasia is a distinct and very important factor in sterility, in fact, it is probably the most frequent inherent cause of sterility in women (based on functional causes) It is of decided importance in the problem of repeated miscarriage Hypoplastic uteri are inadequate during labor in that the labor is prolonged, the pains poor, and postpartum hemorrhage not uncommon

Genital hypoplasia may be associated not only with normally functioning ovaries, but with hypogonadal and hypopituitary states Here the hypoplasia is secondary to inadequate ovarian stimulation Such cases do not present problems involving pregnancy and labor, for if ovarian and pituitary function are inadequate, ovulation will not occur

At the present time we do not understand just why a uterus is hypoplastic in the presence of normal ovarian function The estrogen supply is sufficient to stimulate growth but the response of the myometrial and endometrial cells is inadequate Their response must imply utilization of the hormone by a complex enzyme (and vitamin) system within the cell Disturbances within such a system would lead to abnormalities in the final metabolism of the estrogens Furthermore, the estrogen molecule is normally secreted by the ovary as alpha-estradiol and is, by virtue of its complex ring structure, capable of existing in several isomeric forms It is conceivable that some isomer may be produced by the ovary instead of the normal hormone, or the normal hormone may, in the process of metabolism, be converted into an isomeric form whose function differs qualitatively and quantitatively from the normal Such isomers may not "fit" into the complex enzyme system as well as the normal estrogen For instance, beta-estradiol varies from alpha-estradiol by the position in space of a hydrogen atom at C^{17} Because of this single variation alpha-estradiol is eighty times as active as beta-estradiol

The problem in estrogen utilization by the uterus is complicated still further by other factors Age is of great importance A patient in her twenties has a far better response to estrogenic therapy than one in her thirties, the size of the uterus being approximately the same in both Even in young patients of the same age the dose required to produce a therapeutic effect may vary tremendously, that is, in the presence of a well-balanced endocrine system Vitamins (nutrition) must play an important role

The following explanation is suggested for the mechanism by which genital hypoplasia results in repeated miscarriage During *normal* pregnancy the following relationships must hold

1 Growth of the fetus (and placenta) and of the uterus must be in direct proportion That is, the uterus adequately "fits" the fetus at all times We do not find a six months' fetus in a four months' size uterus, or vice versa (Tumor masses in the uterus do not enter into consideration here but could be made to apply if the volume of the uterine cavity alone were taken into consideration)

2 Discrepancies between the size of the uterus and the size of the fetus are not compatible with the normal progress of the pregnancy

We feel that the increased production of estrogens during pregnancy has as its function the stimulation of the uterus to progressive growth, commensurate with the growing needs of the fetus and placenta If the rate of growth of the uterus is inadequate for the increasing size of the fetus, either the pregnancy will terminate by abortion, or the fetus will die The hypoplastic uterus does not grow progressively with the fetus The *normal* estrogen supply is inadequate to maintain progressive growth At some critical

time during pregnancy, usually between the tenth and twenty-fifth weeks, the crucial point is reached at which the size of the fetus exceeds the growing capacity of the uterus, then the membranes (the weakest point in the uterine cavity) rupture, or bleeding begins and the pregnancy terminates. If the uterus ceases to grow but the fetus continues to do so, death of the fetus will occur This, in my opinion, may be the explanation for our inability to find significant changes in such fetuses at autopsy

The choice of estrogens for therapeutic purposes was limited to the natural estrogens These are alpha-estradiol, estrone, and estriol Their metabolism in the human species may be summarized by saying that alpha-estradiol and estrone are interconvertible and both can be excreted as estriol (Gallagher) [2]

alpha-estradiol ⇅ estrone → estriol

Neither alpha-estradiol nor estrone has, as yet, been isolated from human ovaries, but that is due to lack of material Westerfeld, Thayer, MacCorquodale, and Doisy[4] have isolated estrone, and MacCorquodale, Thayer, and Doisy[5] isolated alpha-estradiol from cow ovaries. On the contrary, estrone (Westerfeld *et al.*, 1938), alpha-estradiol (Huffman *et al.*),[6] and estriol (Browne)[7] have been isolated from the human placenta. Hence in our early cases all three estrogens were administered, either separately or in combination. It was our impression that the combination of alpha-estradiol and estriol gave the best results. All patients reported on here were given alpha-estradiol* and estriol In view of our good results with this combination, the addition of estrone was not repeated, but we now feel that further clinical trials with estrone should be carried out. Our method of therapy is to give daily by mouth 0 1 mg of alpha-estradiol and 0.24 mg of estriol *throughout pregnancy* Therapy began as soon as the patient skipped her period, and terminated when the patient went into labor It is of interest to note that when therapy was discontinued at the onset of the ninth month in 3 patients, two went into labor within a few days, while the third went to term

The dosages of the recommended estrogens were arrived at in the following manner

1 In a previous paper on genital hypoplasia (Kurzrok and Ratner, 1932)[1] we pointed out that the estrogen excretion in the urine of patients with genital hypoplasia was the same as of patients with normal uteri

2 The best therapeutic effects in genital hypoplasia in the nonpregnant state were obtained with small doses of estrogens The above dosage, given by mouth over a period of months during the nonpregnant state, was sufficient to induce uterine growth in all but the marked hypoplasias Large doses, when persistently given, tend to depress the pituitary gland and inhibit ovulation

3 The dosages given during pregnancy must not be large enough to induce staining We have produced bleeding with large parenteral doses It is of interest to note that Van Wagenen and Morse[8] gave large dosages of estrogens (up to 250 mg) to monkeys without interrupting pregnancy

Nine patients out of the 42 reported in this study had, in addition to the genital hypoplasia, an inadequate progesterone metabolism. Eight patients went to term In addition to the estrogen therapy these patients were treated with the following three injections are given per week throughout the first seven months of pregnancy

First injection—500 to 1,000 international units of chorionic gonadotropin

Second injection—2 to 5 mg progesterone

Third injection—100 international units of prolactin

This forms the basis of therapy for all patients with inadequate progesterone metabolism We feel that both chorionic gonadotropin and prolactin stimulate progesterone metabolism.

All patients are given one or more basal metabolism tests Thyroid is prescribed when the basal rate is minus 10 or less. Five patients were given thyroid and all went to term Some patients were given vitamin E We could not convince ourselves of its efficacy Bed rest is not required, but all patients are advised to rest as much as possible for three days during each of the first four expected menstrual periods

Thirty-nine (92 per cent) out of the 42 patients with genital hypoplasia delivered normal children. Thirty-seven went to within about ten days of calculated term Two patients delivered at about the thirty-sixth to thirty-seventh week of pregnancy There were no cases of evident postmaturity The children were normal

Case Reports

The following two patients were delivered by cesarean section (low flap) They gave an opportunity of observing a hypoplastic uterus at term.

Case 1 —J E., aged 28, miscarried at two months in 1942 and again at six months in January, 1944. Both husband and wife were Rh positive. Progesterone metabolism was normal (pregnandiols and endometrial biopsy) Sperm count and morphology

* I am indebted to Dr Erwin Schwenk, of the Schering Corporation, for his generous supply of alpha-estradiol (progynon D H.) and oral progesterone (pranbon)

were normal. The significant physical findings were a congenital retroversion, a short hypoplastic cervix, and a uterus within lower limits of normality

The basal metabolic rate was plus 19 per cent The patient was put on 10 minims of Lugol's solution per day The basal metabolic rate was minus 1 per cent during the third month of pregnancy, and the iodine was reduced to 5 minims It was discontinued during the fifth month, at which time the basal metabolic rate was minus 2 per cent In addition, the patient was given daily 200 mg of mixed tocopherols, 0 1 mg of progynon D H , and 0 24 mg of theelol The patient was also given 20 mg of oral progesterone (pranone) daily The latter medication was tried as a growth supplement to the estrogens The patient went to term Labor was ineffectual and at the end of forty-eight hours, because of rapidly developing fetal distress, a low-flap cesarean section was done A healthy living child was obtained The uterus, after delivery of the child and placenta, was characterized by its small size It was definitely a quarter smaller than a normal uterus under similar conditions

Case 2 —B S , aged 39, had had two previous miscarriages at four and a half and five and a half months They followed spontaneous rupture of the membranes The patient was in bed throughout the second pregnancy Genital hypoplasia was diagnosed after the second miscarriage The patient had no difficulty in conceiving In addition, we found an inadequate progesterone metabolism She was treated by alpha-estradiol and estriol throughout pregnancy, and by progesterone, prolactin, and chorionic gonadotropin during the first seven months Pregnancy (1942–1943) was complicated by a moderately extensive phlebitis during the fourth and fifth months, necessitating the patient's stay in bed for five weeks In view of the patient's age, an android pelvis, absence of living children, and a slow ineffective labor of thirty-six hours, a low-flap cesarean section was done A normal child of 6 pounds was delivered, and she had a normal postoperative course

An examination three months after delivery showed the uterus to be normal in size, shape, and position How much was contributed to the size of the uterus by the operative scar was impossible to state

The patient conceived again in 1944. The same therapy was repeated during the pregnancy, except that during the latter part of the fifth month all therapy was gradually withdrawn Three days after all therapy had stopped the patient began to bleed The same therapy was reinstituted and bleeding stopped in two days Therapy was continued throughout pregnancy and an elective cesarean section (low flap) was done within one week of term A male child, 5 pounds 11 ounces, was extracted It was then noted that the uterus, after delivery of the child and the placenta, was definitely smaller than a normal uterus under similar conditions The walls seemed to be of normal thickness, but the over-all size of the uterus was definitely smaller than normal.

Comment

Both patients were treated with estrogens and progesterone during their pregnancy in the manner described above and both presented during a cesarean section at term uteri definitely smaller than those seen in normal women at the time of section This would imply that complete growth to normality had not taken place, but sufficient growth had been attained to allow the pregnancy to go to term Thirty out of the remaining 37 patients that went to term were reexamined three months after delivery In 21 patients the uterus was found to be normal in size and shape In four patients the uterus was distinctly hypoplastic (not one had nursed) The uterus in the remaining 5 patients was described as being in the lower limits of normality as to size but larger than when first seen These results would indicate that the estrogenic therapy (and in some patients also the additional progesterone, chorionic gonadotropin, and prolactin) led to an increase in the size of the uterus in 26 out of 30 patients who went to term Whether this increase is permanent or whether a return to a more or less hypoplastic state will occur is at the moment impossible to state

In the following three patients estrogenic therapy was unsuccessful

Case 3 —J S , aged 29, had miscarried spontaneously at seven to eight weeks on two previous occasions Genital hypoplasia was diagnosed The patient usually experiences some difficulty in conceiving, taking about one year for each pregnancy She began to bleed during her eighth week and miscarried A curettage revealed nothing significant Re-examination three months after the curettage revealed a similar state of uterine hypoplasia The cause of the third miscarriage could be an unyielding uterine hypoplasia. Perhaps larger doses might be more effective The administration of all three natural estrogens alpha-estradiol, estrone, and estriol may subsequently prove more effective, for it is our belief that each of these substances has some peculiar function different from the others

Case 4 —R. R. had had six previous miscarriages The first three pregnancies terminated during the fifth month, the fourth during the seventh month, and the fifth and sixth during the fourth month She had several curettages and was informed that the curettings showed intensive inflammatory reaction She was examined after her sixth miscarriage and a fundal hypoplasia was demonstrated There was no evidence of inflammation in the pelvis She conceived for the seventh time and estrogen therapy was immediately begun In addition she was given 200 mg of vitamin E per day The patient miscarried again during the twelfth week The termination of this pregnancy, as of all others, began with a low-grade fever which lasted for two weeks During the temperature the Aschem-Zondek test remained positive When the test be-

came negative a curettage was done. The curettage showed an inflammatory zone surrounding and infiltrating the decidua and chorionic villi. The reaction bore a superficial resemblance to that described by Evans, Burr and Althausen[9] for the lethal effect of avitaminosis E on the developing rat embryo. Re-examination of this patient several months after the seventh miscarriage revealed a persistent fundal hypoplasia. If this miscarriage could be ascribed to an E avitaminosis it would imply an inability to utilize the administered vitamin E.

Case 5.—This patient miscarried during the fifth month in her first pregnancy and during the fourth month of her second pregnancy. During her third pregnancy she was kept in bed and given progesterone. Pre-eclamptic toxemia developed during the eighth month and the patient was delivered by means of a cesarean section of a premature viable infant. The patient was first seen about one year after her third pregnancy and an inadequate progesterone metabolism plus a genital hypoplasia were diagnosed. They were treated by estrogens, progesterone, prolactin, and chorionic gonadotropin. The patient was delivered, from below, of a normal child at term. The uterus was found to be normal in size following this pregnancy. Two years later the patient conceived again and at the expressed desire of the patient the same therapy was reinstituted. The patient developed a severe pre-eclamptic toxemia during her sixth month (blood pressure 190/140, albumin 3 plus). She miscarried at the beginning of her seventh month. We feel that the cause of the miscarriage was the severe pre-eclamptic toxemia.

Conclusions

1 Genital hypoplasia, especially uterine, may occur in the presence of normal ovarian function. It represents an inherent defect in the ability of the uterus to metabolize the endogenous estrogens.

2 Uterine hypoplasia may result in repeated miscarriage. Such hypoplasia remains evident in the nonpregnant state even after repeated miscarriages. It appears that short pregnancies alone are insufficient to correct the hypoplasia.

3 The uterine hypoplasia may be corrected by the daily oral administration of estrogens throughout pregnancy, namely, 0.1 mg. of alpha-estradiol and 0.24 mg. of estriol.

4 Forty-two patients who had miscarried at least twice previously were treated with estrogens in this manner, and 39 (92 per cent) were delivered at term of normal living children.

5 Three patients (8 per cent) miscarried during pregnancy. In one case the failure was attributed to a pre-eclamptic toxemia of pregnancy. The second failure could be due to an E avitaminosis, while for the third we have no explanation.

6 Nine out of the 42 patients also had an inadequate progesterone metabolism. In addition to the estrogen therapy they received during the first seven months of pregnancy intramuscular injections of chorionic gonadotropin, progesterone, and prolactin.

7 The sperm morphology was normal in all patients. A high abnormal morphology leads to repeated miscarriage.

8 The mechanism of genital hypoplasia and the manner in which it produces repeated miscarriages are discussed.

I am indebted to my former associates, Dr. Leo Wilson and Dr. Paul Lass (now with the armed forces) for the assistance in the early part of this work and to Dr. Milton J. Goodfriend, the chief of the service, for putting at our disposal the clinical material of the hospital and for his many kindnesses.

MALARIA PREVENTIVE HAILED BY AUSTRALIAN SCIENTISTS

A group of Australian scientists who allowed themselves to be bitten repeatedly by malarial mosquitoes announced on December 28 that a new drug, paludrine, renders malaria no more harmful than the common cold.

Members of the group, including physicians, pathologists, and entomologists, remained fit despite repeated infection by taking doses of a tablet of 1½ grains of the drug, they said. Some of the members were bitten two hundred times by mosquitoes carrying the parasite of tertiary malaria.

The scientists said results of their study indicated that the taking of one or two paludrine tablets each weekend would give complete freedom from malarial attacks.

Paludrine in therapeutic doses also controls malarial fever and cures malignant malaria, they added.—*N. Y. Herald Tribune, Dec. 29, 1945.*

THE X-RAY AND PUBLIC HEALTH

With Special Reference to Tuberculosis

H R Edwards, M D , F A C P , New York City

(Director, Bureau of Tuberculosis, New York City Department of Health)

WE ARE honoring this evening Wilhelm Conrad Roentgen, a man who has made one of the most momentous contributions of all time to the welfare of mankind It is unnecessary for me to recount to you, as roentgenologists, the wide variety of applications of the x-ray in medical science It does, however, seem appropriate to comment on this discovery, as it has been applied to the field of preventive medicine, for the promotion of the public health While there are other fields than tuberculosis that involve the public health, and in which the x-ray has been of value, it is, nevertheless, as a method of tuberculosis eradication that it has played one of its greatest roles The control and eradication of tuberculosis is dependent primarily upon a diagnosis, and the x-ray stands pre-eminent today in this elementary step

The history of tuberculosis and its eradication here in New York City makes it obvious that this disease was truly the great white plague, and a champion of the men of death in the past century The remarkable decline that has occurred since 1882 is cause for rejoicing and certainly some feeling of satisfaction, but we are still too far from the attainable irreducible minimum to relax our efforts for a single moment There are still close to 4,000 New York City residents who die unnecessarily of this disease each year, and throughout the nation this figure exceeds 50,000

The factors that have been at work to bring about this more favorable situation today are many and varied, and it is impossible to properly evaluate and fully assess them individually In this period, we have seen the industrial era blossom into full flower, and with it came the very conditions that produced overcrowding, and at first substandard wages that were potent causes in the spread of the disease As the years have passed, there have been vast improvements in working and living conditions, with a general raising of the economic level to a height that is beyond that of all other nations

There has been an expansion in hospital beds from a few thousand at the turn of the century to over 100,000 today Clinics, public-health nursing services, and a host of other facilities have been developed, which have contributed considerably to the diagnosis and supervision of cases For the past forty years there has been a nation-wide campaign directed to health education, and while it is impossible to evaluate its influence accurately, it has, without doubt, motivated millions to take voluntary action in disease prevention

Despite the accomplishments of the past and the present, we are forced to the conclusion that there are still fundamental problems relating to individual resistance and susceptibility about which we know very little The solution of these two factors may very well result in the ultimate eradication of the disease

There is no acceptable immunizing agent against the disease, nor is there a specific cure Therefore, our only hope for further eradication must depend upon early diagnosis of the case, and the setting up of adequate safeguards to prevent the further spread of infection

The roentgenogram stands in the very forefront of all diagnostic methods, and in 80 to 90 per cent of the earlier cases, it is our only clue to the existence of the disease, because these persons, for the most part, are without symptoms The chest roentgenogram indicates location, extent, and, if made periodically, the dynamic status of a lesion It unfortunately does not tell us the significance of the lesion in a majority of instances, unless it is supplemented by a careful history and physical examination, and even then the determination may be very difficult In other words, there is no indication that we can supplant the qualified internist and depend upon a push-button mechanism

The chest x-ray has been dramatized these past five years by one of the greatest mass surveys in the history of man When the armed forces decided to require a chest x-ray of every individual before acceptance into the services, they assured the citizens of this nation of a health protection that had never before been possible As a result, thousands of men and women with infectious, active, or potentially active tuberculosis were prevented from entering the services and spreading their disease to their comrades, to say nothing of the waste that would have resulted in an attempt to train them for military service The end results that would have been reflected in veterans' pensions and benefits have been reduced in this war to one tenth of what they were in the last Spillman, at the outset of this

Read at a dinner of the New York Roentgen Ray Society, Hotel Commodore, November 8, 1945, commemorating the fiftieth anniversary of the discovery of the x-ray

war, reported on the veterans' tuberculosis problem that resulted from World War I, and he indicated that the pension and compensation bill that the government had paid was at that time reaching $1,000,000,000, and that the end was not yet in sight.

The x-ray was in use in the first World War, but we did not have the present facilities for mass action. It was costly, and was used only as confirmatory evidence In fact, at that time there were those who were unwilling to use it as a case-finding procedure

Here in New York City, the chest x-ray of masses of the apparently healthy population began in 1933, and up to 1940, when recruitment for the armed services started, approximately half a million examinations had been made. It was due to this experience, and the availability of equipment, that the Department of Health was able to offer its services to the induction centers, until they could provide their own equipment and personnel to handle routine chest x-rays

In offering this service to the Army, we set up a program that conformed to our previous procedures in mass survey x rays It was arranged that all persons rejected because of intrapulmonary shadows at the induction center would be immediately referred to us for further study and evaluation. The referral, made by an Army officer, resulted in a high per cent of attendance. The draft boards further cooperated by ordering any delinquent to report for examination, as Selective Service had designated us as special consultants in these matters Thus, throughout the entire period, over 90 per cent of all men rejected because of shadows in their x-ray that might presumably be on a tuberculous basis were eventually re-examined by us

These examinations resulted in a considerable salvage of manpower among those who had questionable changes, or where changes did exist that were later adjudged to be of no significance. These examinations also brought to light thousands of lesions that had never been known before. Approximately 50 per cent of them were in the minimal stages, and less than 20 per cent had ever been reported as a case before.

In the further supervision of these cases, the Department followed its procedure in its own mass survey program This was for the purpose of evaluating the case, then to see that the patient was placed under proper medical care. If the individual had a family physician, he was urged to place himself under his supervision On the other hand, if the physician requested a report from us, it would be provided, with a loan of the x-ray If there was no family physician, the individual was referred to a district clinic, where both he and his contacts would receive such supervision as was indicated In any event, the case was registered in the district office, and the public-health nurse would take steps to see that the case was under the care of either a private physician or some other suitable medical care In those cases under private medical care we offered our consultation chest service, not only for the case, but for the examination of contacts as well Through this means, thousands of contacts to cases found in the armed services, as well as our regular surveys, have been brought in for chest x-ray examination

We have made spot checks of our work, and they indicate that in our clinic practice we are examining an average of 80 per cent of the contacts to known cases registered, and in these examinations of contacts on a city-wide basis we have found approximately $1^1/_2$ per cent that have significant lesions in need of further supervision This figure may seem rather low, when we recognize that tuberculosis is spread from person to person. It must be remembered, however, that in the city the size of New York, the source of infection is oftentimes difficult to locate It certainly does not exist in the intimate family of the majority of the cases that we discover Furthermore, the type of disease found in mass surveys is, for the most part, minimal in extent, and without clinical symptoms. If, however, we considered contacts in relation to the more advanced and open forms of the disease, we may expect to find from 10 to as high as 40 per cent of their contacts with manifest lesions

Experience has shown that of all disease found in mass surveys of apparently healthy adults, approximately one third will be significant in character, that is to say, it will either be an open infectious case, which is probably not more than one or two per thousand examined, to those who have only an x-ray shadow, characteristic of an unstable process In the remaining two thirds of cases found in surveys, the shadows representing previous disease are at the time probably of little significance, and for the most part the individual has at no time recognized the clinical disease, nor will he have knowledge of having been exposed to a person who had tuberculosis It must be remembered that any mass chest x-ray survey program conducted at a given time will reveal only those changes that have occurred in the months or years that have passed. It does not protect the individual against future disease. However, if a routine chest x-ray is done on a periodic basis, any new changes noted will truly indicate a new, and in all probability, an early tuberculosis Therefore, it is necessary, in tuberculosis control work, to consider a program that will be repeated at intervals, and not just a study at one time in a person's life This philosophy

THE X-RAY AND PUBLIC HEALTH

With Special Reference to Tuberculosis

H R Edwards, M D , F A C P , New York City

(Director, Bureau of Tuberculosis, New York City Department of Health)

WE ARE honoring this evening Wilhelm Conrad Roentgen, a man who has made one of the most momentous contributions of all time to the welfare of mankind It is unnecessary for me to recount to you, as roentgenologists, the wide variety of applications of the x-ray in medical science It does, however, seem appropriate to comment on this discovery, as it has been applied to the field of preventive medicine, for the promotion of the public health While there are other fields than tuberculosis that involve the public health, and in which the x-ray has been of value, it is, nevertheless, as a method of tuberculosis eradication that it has played one of its greatest roles The control and eradication of tuberculosis is dependent primarily upon a diagnosis, and the x-ray stands pre-eminent today in this elementary step

INCREASED URINARY FREQUENCY IN WOMEN CAUSED BY EXTRINSIC GENITOURINARY TRACT LESIONS

JOSEPH A LAZARUS, M D , New York City

INCREASED urinary frequency, commonly complained of by women is associated, as a rule, with the ordinary varieties of genitourinary disorders These usually respond to routine urologic therapy There are many patients, however, for whom the customary treatment is inadequate because the lesion lies extrinsic to the urogenital tract. It is this category which requires detailed differentiation and discussion

The most common extrinsic conditions which cause increased urinary frequency in women may perhaps be succinctly classified as those arising in the (1) uterus and adnexa, (2) gastrointestinal tract, (3) neurologic system, and (4) endocrine system There are also (5) miscellaneous causes

Uterus and Adnexa

Fibroids, malpositions, and diseases of the adnexa, such as tumors of the ovaries or fallopian tubes, are frequently associated with urinary disturbances Increased urinary frequency may result from irritation of the vesical wall through spreading infection from an adjacent infected fallopian tube or from reduction of the vesical capacity caused by compression from an adjacent tumor of the ovary or uterus Admittedly, many patients with abnormalities of the uterus or adnexa have no urinary symptoms The physician is therefore constrained to make a urologic examination before coming to a conclusive diagnosis that an obvious extravesical pelvic lesion is solely responsible for the urinary discomfort It is only when the urinary tract has been, from the diagnostic viewpoint, definitely excluded that the urologist may venture an opinion that the urinary frequency is caused by disease of the uterus or adnexa However, if the urinary tract is also found to be affected, it is advisable to withhold an opinion as to causal relationship until a pathologic process in the urinary tract is eliminated.

Case 1—Mrs. A. G., aged 68, who consulted me on September 7 1939, complained of chills and fever, burning sensation on urination and increased urinary frequency, pain in the left lumbar region abdominal cramps, hiccoughs, and pruritus

Seven months before this she had begun to complain of pain in the abdomen and left loin, difficulty in urination and insomnia. A physician noted the presence of an ovarian cyst. Five months later an oophorectomy was performed for malignant dermoid cyst. During convalescence she developed a severe attack of right pyelonephritis which never entirely subsided About three to four days previously she had chills, fever and sweats, and pain in the left loin accompanied by increased urinary frequency

Cystoscopy showed a mild cystitis. The right kidney was easily catheterized, while the left catheter met an impassable obstruction at 10 cm. from the bladder

Heart and lungs were normal. Blood pressure was 160/80

Bilateral shadowgraphy showed the tip of the left catheter lying opposite the fifth transverse process, where a shadow could not be visualized The renal silhouettes were obscured by gas.

Laboratory Data Urinalysis—specific gravity, 1 014, pH, 5.2, albumin, trace, sugar, negative, microscopic—40–50 white blood cells with small clumps, bacteria. Blood Chemistry—urea nitrogen, 15 0 mg. per cent, creatinine, 1.3 mg per cent. A two-hour phenolsulfonphthalein test totaled 29 per cent.

Blood Count—hemoglobin, 70 per cent, red blood cells, 3,260,000 white blood cells, 8,550, color index, 1 07, polymorphonuclears, 77 per cent, lymphocytes, 16 per cent rods, 3 per cent, mononuclears, 4 per cent.

Blood Culture—Bacillus coli, Escherichia coli Bladder urine showed B coli Esch. on culture, and gram-negative bacilli on smear, negative for tuberculosis.

Operation (September 8, 1939)—Left nephrectomy and incomplete ureterectomy were done for left pyonephrosis, periureteritis, and carcinoma of the ureter The kidney was definitely enlarged and showed a high-grade perinephritis. The pelvis of the kidney was notably thickened and sclerotic, and was intimately adherent to the peritoneum There were two large ureters emergent from the pelvis, which presented a severe grade of periureteritis, binding them to the peritoneum. In one of the ureters there was a hard mass about the size of a nut. The renal pelvis was filled with thick, creamy pus. With great difficulty the kidney was mobilized and removed

Pathologist's Report "Metastatic immature squamous-cell carcinoma situated periureterally and involving the ureter at one site. Stenosis of ureter with hydropelvis, purulent ureteritis, and pyelonephritis."

Case 2—Mrs. E. S aged 40, consulted me on February 16, 1939 complaining of urgency and frequency of urination of six months' duration and swelling of the right foot of six weeks duration

Past history was irrelevant. For the past six months she had complained of a slight burning sensation on urination with extreme urgency, voiding every two to four hours during the

[illegible]turia. She experienced a [illegible] hypogastrium. Two

a mass had been noticed in the left side of the abdomen

Cystoscopy showed a striking distortion of the bladder, with intrusion of the posterior wall into the vesical lumen, and dislocation of the trigone, so that the ureteral orifices appeared elevated and laterally displaced The right ureteral orifice was completely obstructed, but the left catheter passed easily into the renal pelvis

Vaginal examination showed a large tumor which filled the lower half of the abdomen and reached slightly above the umbilicus The tumor consisted of two masses, one much larger than the other, the larger mass occupied the entire right lower quadrant and extended over to the left side, and felt hard but not tender, the smaller mass, which was situated in the left lower quadrant, was slightly tender and somewhat movable Blood pressure was 132/80

A scout film revealed a large shadow extending from the pelvis to the second lumbar vertebra. Intravenous pyelograms disclosed the bladder to be compressed and displaced to the left side of the pelvis The kidney pelves were filled on the five-minute film, and were free of dye on the seventy-five-minute film

Laboratory Data Urinalysis—specific gravity, 1 016, pH 6 7, albumin and sugar, negative, microscopic occasional red blood cells

Blood Chemistry—urea nitrogen, 11 5 mg per cent, creatinine, 1 2 mg per cent, urea clearance, 142 8 per cent, hemoglobin, 81 per cent The Wassermann test proved negative

On February 27, 1939 a supravaginal hysterectomy and left salpingo-oophorectomy was carried out for a large uterine tumor extending into the broad ligament Filling the entire lower half of the abdomen and reaching above the umbilicus there was an enormous tumor which completely distorted the anatomic structure of the pelvis The tumor appeared to arise from the left wall of the uterus and extended between the leaves of the broad ligament The uterus, left tube, and ovary appeared to be perched upon the vault of the tumor which reached to the left of the midline The veins of the broad ligament were distinctly dilated The uterus and tumor were removed

The relationship between increased urinary frequency and adnexal inflammatory disease is not always clearly defined The reason for this is that in many examples of salpingitis, particularly when caused by the gonococcus, there is an accompanying urethritis due to the same organism, and it is the urethritis rather than the salpingitis which causes the urinary frequency Treatment solely of the salpingitis frequently results in abatement of urinary frequency, because the urethritis often subsides spontaneously following cure of the adnexal infection .

Case 3—Miss M H , aged 29, consulted me on October 31, 1941, complaining of acute pain in the lower abdomen of several days' duration Previously she had had leukorrheal discharge with dysuria and frequency of urination, voiding every two hours during the day and several times at night

Vaginal examination disclosed a large fluctuant mass in the left cul-de-sac There was manifest tenderness with positive rebound sign in the lower abdomen, particularly over the left lower iliac fossa The diagnosis was of acute left pyosalpinx

Endocervicitis may be the underlying cause of urinary frequency Careful examination of the cervix should always be made by the urologist during the course of a routine urologic examination Here again he must exercise caution before venturing an opinion, since it is well known that the majority of patients who have endocervicitis do not complain of increased urinary frequency It is better to rule out a lesion in the urinary tract before concluding that the inflammatory cervical condition is the cause of urinary frequency

Gastrointestinal Tract

An abnormal condition within the anus, such as a fissure or painful hemorrhoid, will often cause urinary frequency Patients consult physicians for painful anal disorders rather than for the accompanying urinary symptoms The reverse of this is true in examples of urinary frequency associated with disorders situated higher in the colon These commonly are (*a*) carcinoma of the rectum, (*b*) carcinoma of the sigmoid or colon adherent to the bladder, (*c*) diverticulitis of the sigmoid adherent to or in juxtaposition to the bladder, (*d*) pelvic abscess, usually of appendiceal origin, and (*e*) certain varieties of retrocolic appendicitis

Case 4.—Mrs D H., aged 61, consulted me on January 22, 1938, complaining of severe pains in the left upper quadrant of the abdomen and left loin, nausea, and frequency of urination, voiding six to seven times during the day and three to four times at night There was no burning on urination, hematuria, or dysuria Constipation was extreme For twelve years she had acute "stabbing" pain in the left loin, and for the past three years it had been growing more severe, occurring at more frequent intervals

Cystoscopy showed a normal bladder with normal ureter orifices The kidneys were easily catheterized, and there was a rapid flow of macroscopically clear urine from both sides Microscopically the urine from both kidneys contained an occasional white blood cell Phenolsulfonphthalein given intravenously appeared in good concentration from the kidneys in three minutes

In bilateral shadowgraphy the left kidney appeared to be enormously enlarged Left retrograde pyelogram showed a pelvis which appeared to be lengthened along the vertical axis of the kidney, presenting evidence of compression of its midportion Intravenous pyelography showed that the

lower pole of the left kidney was enormously enlarged and globular, and reached to about ½ inch above the crest of the ilium. A roentgenogram of the chest failed to show metastases. The barium enema showed a downward and mesial displacement of the descending colon and splenic flexure by the tumor in the left loin.

Physical examination revealed an aged patient who appeared chronically ill. There was obvious pallor Blood pressure was 142/70 There was definite left costovertebral tenderness. The abdomen was distended Examination of the left loin revealed a tender mass extending almost down to the ilium. Its mesial border could not be accurately delimited.

Laboratory Data Urinalysis was negative, a two-hour phenolsulfonphthalein test totaled 42 per cent. Blood chemistry—urea nitrogen, 13 0 mg per cent, creatinine, 1.2 mg per cent, sugar, 118 mg per cent, urea clearance, 90 7 per cent. Blood count—hemoglobin, 66 per cent, red blood cells, 2,550,000, white blood cells, 8,050, poly morphonuclears, 65 per cent, lymphocytes, 26 per cent, rods, 6 per cent basophiles, 1 per cent, mononuclears, 2 per cent. Sedimentation rate, 72 mm. after one hour The Wassermann test was negative.

Operation Through a 7 inch left Albarran incision the kidney was exposed. It was immediately noted that the mass which was originally conjectured to be in the lower pole of the kidney was extrarenal, but adherent to it by a few adhesions. On separating the lower pole of the kidney from the tumor, the latter was found to consist of a hard mass about the size of a large baseball, involving the splenic flexure of the colon. The lumen of the bowel, however, was patent. The tumor apparently arose from the posterior wall of the bowel and grew posteriorly toward the renal fossa. Following a Mikulicz operation the patient recovered and remained free of all urinary symptoms.

Carcinomas of the rectum frequently give rise to symptoms referable to the urogenital tract, among which urinary frequency is one of the most common In examples of early lesions, urologic symptoms occasionally predominate to the exclusion of those referable to the gastrointestinal tract, unless the latter are sought for especially It is for this reason that the urologist, in order to avoid errors in diagnosis and often great chagrin, should make searching inquiries, particularly regarding changes in bowel habits and the passage of blood and mucus in the stools. Since the majority of rectal carcinomas are situated low, they can usually be detected on careful rectal digital examination I usually place the patient in the supine position, with the knees flexed and drawn toward the chin. The gloved finger, thoroughly lubricated, is gently introduced into the rectum and the patient is then requested to strain. The tip of the finger is carefully swung around the entire circumference of the bowel wall If no lesion is palpated, she is instructed to return for sigmoidoscopic or proctoscopic examination Specimens of any suggestive lesions are routinely taken for pathologic examination

Occasionally an area of redness or bullous edema of the bladder wall, usually on the posterior wall, may be noted during the course of cystoscopic examination This observation is highly suggestive of an extravesical lesion adherent to the bladder wall, and warrants a careful examination to rule out a lesion in the lower gastrointestinal tract

Carcinomas of the sigmoid, like those of the rectum, may give rise to increased urinary frequency along with other urologic symptoms only when they are contiguous with the bladder Careful interrogation of the patient regarding bowel habits and characteristics may be indicative of the condition. Such evidence, however indecisive, warrants a careful sigmoidoscopic examination and a contrast barium enema roentgen study to rule out colonic pathologic changes.

Diverticulitis of the sigmoid is perhaps one of the most frequent conditions of the colon associated with vesical symptoms, because of the tendency of the affected loop of sigmoid to become adherent to the adjacent viscus, especially the urinary bladder It is true that ordinarily the symptoms are predominantly characteristic of some intestinal disorder, especially in well-advanced conditions In patients with less advanced conditions, however, vesical irritability often overshadows all other symptoms, and may lead to diagnostic errors Patients with acute diverticulitis present a clinical syndrome which should not be difficult to recognize They are usually obese and on careful interrogation give a history of constipation and pain in the left lower quadrant of the abdomen During an acute episode, fever, leukocytosis, and extreme tenderness with a possible rebound sign over the left lower rectus muscle are present. At times it is possible to palpate a mass in the left iliac fossa. Sigmoidoscopy may be a valuable aid in diagnosis, particularly when supplemented by a barium enema roentgen examination

Case 5—Mrs. R. G., aged 50, consulted me on January 17, 1938. When admitted to the hospital she complained of pain in the abdomen and left lumbar region, the pain radiated downward, was present for a day, and was associated with frequency of urination, tenesmus, chills, and fever The family and past histories were irrelevant.

For the past three years she had had diurnal and nocturnal urinary frequency On the day prior to consultation she developed severe generalized pain in the abdomen and left loin. She voided every half- to one hour during the day and every hour at

night and complained of extreme tenesmus Chills and fever were prominent symptoms

Cystoscopy showed a few hemorrhagic spots in the region of the left ureteral orifice Both kidneys were easily catheterized, the flow of urine from both sides was sluggish Phenolsulfonphthalein returned in good color from the right side in four minutes, and from the left side in five minutes Microscopically the urine from the right kidney showed an occasional red blood cell and a few epithelial cells, while that from the left contained three to four white blood cells and fifteen to twenty red blood cells

A scout film failed to show the presence of calculi Much gas was visible in the large bowel Bilateral retrograde pyelograms showed broadening of the minor calices of the left pelvis The right kidney was ptosed, and there was a slight posterior displacement of the ureteropelvic juncture

Abdominal examination disclosed an indefinite tender mass in the left midabdomen Rebound tenderness was elicited over the left lower rectus muscle as well as over the left costovertebral angle Vaginal examination revealed a large uterine fibroid

Laboratory Data Urinalysis—specific gravity, 1 017, pH, 6 2, albumin, 2 plus, sugar, 1 1 per cent, microscopic examination revealed innumerable red blood cells The bladder urine showed Staphylococcus albus and B subtilis, and the urine from the left kidney showed B subtilis on culture All specimens were negative for tuberculosis Blood culture was negative

Blood Count—hemoglobin, 86 per cent, red blood cells, 4,040,000, white blood cells, 14,450, polymorphonuclears, 75 per cent, lymphocytes, 10 per cent, rods, 12 per cent, monocytes, 3 per cent Sedimentation rate was 45 mm after one hour

On June 18, 1938, a Mikulicz resection was performed for tumor of the sigmoid through a 5-inch left paramedian reverse Kammerer incision Situated in the midportion of the sigmoid there was a tumor about the size of a small tangerine, with brawny induration of the mesentery The sigmoid flexure was freely movable

Recovery was uneventful and she was discharged from the hospital July 24, 1938, with a well-functioning colostomy

On September 1, 1938, the colostomy was closed, and she left the hospital in good condition eighteen days later Urinary symptoms had completely disappeared

Pathologist's Report "Diverticulitis of sigmoid with mesosigmoidal abscess formation No evidence of malignancy"

Comment

It has been my experience to find urinary frequency caused by pelvic abscesses, usually of appendiceal origin In acute conditions a correct diagnosis should offer little, if any, difficulty Longstanding, well-encapsulated abscesses may cause difficulty in differential diagnosis A careful rectal digital examination is obviously of great importance in the recognition of these conditions As a rule a history suggestive of previous appendicular attacks can be elicited on careful questioning Nevertheless, patients complaining of increased urinary frequency who reveal a pelvic mass on rectal digital examination should undergo an exploratory laparotomy

Retrocolic appendicitis occasionally gives rise to increased urinary frequency The appendix usually lies in direct contact with or in close proximity to the ureter, as a rule it is then found to be acutely or subacutely inflamed, showing evidence of periappendicitis in which the inflammatory process has spread to the neighboring ureter, and giving rise to periureteritis or ureteritis The vesical irritability is probably caused by inflammation of the ureteral wall causing a similar condition in its intrinsic network of nerve fibrils In acute and subacute conditions diagnostic errors can be reduced by taking careful histories and carrying out thorough physical examinations Percussion tenderness over the right loin can usually be elicited, while the blood count ordinarily shows an elevation in the leukocyte count Rectal temperature usually ranges from 99 F to 101 F Passage of a catheter may disclose an obstruction or narrowing in the ureter where the latter comes in contact with the appendix Urine obtained from the renal pelvis may be acellular, while a specimen collected from the lower ureter may show red or white cells, or both In patients with chronic retrocolic appendicitis, diagnosis may offer great difficulties. A roentgen film taken after passing an opaque catheter into the right renal pelvis, after the administration of a barium meal, may occasionally outline the appendix, and may disclose its position with relation to the adjacent ureter In doubtful examples, appendicectomy is justifiable

Neurogenic Disorders

Increased urinary frequency is common among women with psychic or neurogenic disturbances We are all familiar with what is termed the "irritable bladder" of hysterical or neurotic women, but physicians frequently overlook or attribute this complaint to some psychoneurotic condition when, in fact, the afflicted person may be suffering from an organic disease of the nervous system Without entering into a detailed discussion concerning the various neurogenic disorders which may give rise to increased urinary frequency, it is desirable to indicate a few of the more common conditions seen by the urologist In this category we may find patients with spinal-cord tumors, usually situated in the region of the cauda equina Disseminated sclerosis and other varieties of degenerative lesions of the cord may also lead to irritable or contracted bladders,

resulting in increased urinary frequency Any disorder of the central nervous system converts the bladder into a large atonic organ with decreased expulsive power of the detrusor muscle due to disturbed innervation, which will sooner or later result in urinary incontinence or overflow, which the patient alludes to as increased urinary frequency Again, any disease of the central nervous system which leads to hypertrophy of the detrusor muscle and consequent reduction in vesical capacity eventually gives rise to the so-called "contracted bladder," and, by virtue of its reduced capacity, leads to increased urinary frequency In order to rule out a neurogenic condition, the urologist in his examinations should include a careful cystometric survey and also a few of the special neurologic tests, such as pupillary reflex, knee jerk, ankle jerk, Rhomberg, and Babinski, and an attempt to elicit evidence of saddle anesthesia

Case 6—Mrs. M H., aged 41 years, consulted me on May 24, 1934, complaining of urinary incontinence of three years' duration She had no hematuria, dysuria, backache, fever, or chills Five years previously she had noticed a sensation of weight in the right leg, and frequency of urination, thereafter urinary symptoms increased The sense of heaviness in the right leg persisted, and she complained of slight vertigo Her gait was wobbly and there was a noted tendency to favor the right side.

Cystoscopy showed fine trabeculations of the bladder, with prominence of the internal sphincter due to cystocele Both kidneys were easily catheterized. Phenolsulfonphthalein given intravenously appeared in good concentration from both sides in five minutes. Urine from both kidneys contained several red blood cells.

Bladder Urine Albumin, faint trace, sugar, negative, microscopic amorphous urates and occasional red blood cells were present, specific gravity, 1 004. A two-hour phenolsulfonphthalein test totaled 55 per cent.

Bilateral shadowgraphy showed the tip of the right catheter lying in the renal pelvis the tip of the left catheter was situated over the third transverse process No shadow could be seen in the course of either ureter

Physical examination showed an obese patient, 41 years of age, who did not appear acutely ill. Blood pressure was 110/70 She had an exaggerated right knee jerk. There was no ankle clonus. Bilateral Babinski and Oppenheim signs were most notable on the right side. She had no loss of muscular power in the legs. Her gait was wobbly, with a tendency toward incoordination of movements of the right leg, so that she appeared to stagger to the right side. Urethroscopy revealed relaxation of the internal sphincter

The patient was referred to a neurologist, who diagnosed the condition as one of multiple sclerosis.

I have occasionally found increased urinary frequency among women who in early childhood suffered from nocturnal enuresis Why this should be so is difficult of explanation on a physical or organic basis, and I have attributed it merely to habit

Another group of patients in this category are women who, as a result of some sexual disorder, find apparent relief in increased urinary frequency, which is often associated with tenesmus and dysuria. Examples of this condition are far from rare, and unless recognized, fail to yield to the customary treatment Once the condition is recognized, psychiatric rather than urologic treatment is in order But since the urologist is usually the first to see the patient, he should be aware of the underlying maladjustment discoverable by tactful interrogation It is problematic whether the cause of the urinary disturbance is attributable to chronic passive congestion of the uterus and adnexa which affects the bladder by pressure and irritation, or entirely to psychogenic influence

Case 7—Mrs. M S., aged 37, consulted me on January 5, 1932, she complained of attacks of right lumbar pain of five years' duration. The last attack was accompanied by fever, chills, and dysuria. There was no hematuria. Urinary frequency followed the attacks. There was a choking sensation, but no cough and no gastrointestinal disturbances

Following a thorough urologic survey, no intrinsic lesion of the genitourinary tract could be found Careful interrogation, however disclosed a manifest maladjustment to marital life.

Endocrines

The relationship between endocrinology and water balance as pertaining to urologic problems is a subject too wide for cursory mention It may suffice to state that the pancreas, ovaries, pituitary, and adrenals are the glands most involved It is common knowledge that diabetes mellitus gives rise not only to polydipsia but to polyuria and increased urinary frequency, and errors in diagnosis in this disease should not be made. On the other hand, diabetes insipidus is frequently overlooked The fundamental defect is a failure of the antidiuretic factor of the pars nervosa of the posterior pituitary to exert its normal physiologic control over the absorptive function of the renal tubular system The secretion of the antidiuretic hormone is controlled by the nucleus supraopticus, which is situated in the anterior part of the hypothalamus In diabetes insipidus the polyuria is primary, while the polydipsia is secondary and compensatory A simple and practical rule which I have followed is to request the patient to collect a specimen of urine in the morning after abstention from fluids since dinner the previous evening

If the specific gravity is 1 006 or lower, the diagnosis is certain If the specific gravity is 1 010 or over, diabetes insipidus can definitely be ruled out

In adrenal cortical insufficiency there occurs (*a*) an increased loss of sodium and chlorides in the urine, with a corresponding loss of sodium and chlorides in the blood plasma, (*b*) decrease in the loss of potassium in the urine and a corresponding increase in the concentration of potassium in the serum, (*c*) loss of fluids from the plasma resulting in a decreased volume of plasma and increased hematocrit values and red blood cell count, (*d*) increased plasma protein concentration, (*e*) increased oxygen capacity of the blood, (*f*) decreased blood flow resulting in impaired renal function and consequent increase in blood nitrogens Urinary frequency occurs with impaired renal function

Miscellaneous

In this category may be mentioned the influence of foods, drugs, and allergens Urinary frequency is often caused by a great many feeding indiscretions. Some women are inveterate coffee or tea drinkers, and the urinary disturbance may be due entirely to the diuretic effects of the caffeine or theobromine and to the overabundance of water which they consume daily This holds equally true of women who enjoy beer drinking

The problem of allergy as it pertains to urology is a large one It has not received adequate investigation It is my impression that many persons suffering from increased urinary frequency are "allergic" to various foods A few minutes spent in questioning patients concerning food sensitivity would serve to explain to a large extent the underlying cause or causes of urinary frequency

Summary and Conclusions

The problem of increased urinary frequency in women caused by lesions outside the urogenital tract is discussed The extrinsic causes are those pertaining to the: (1) uterus and adnexa, (2) gastrointestinal tract, (3) neurologic system, (4) endocrine system, and (5) miscellaneous causes

An awareness of the extrinsic causes of increased urinary frequency would obviate errors in diagnosis and eliminate prolonged and useless treatment of the urologic tract to the detriment of the patient, and often to the chagrin of the urologist

NEW METHODS AID IN "HUNGER" TESTS

New methods, which constitute an important advance in studying the problem of "hidden hunger" among school children, have been developed at the Public Health Research Institute of the City of New York, Inc, according to the annual report submitted on October 22 to Mayor La Guardia by David M Heyman, president of the institute

These methods make it possible to test for a number of the vitamin and other food essentials on but two or three drops of blood, thereby making it feasible to determine the nutritional status of large groups quickly and accurately, Mr Heyman reported They are now being used by the nutrition clinic of the Health Department, and by two of the city's largest hospitals

The institute has also developed an improved and more economic method for the administration of penicillin, the report said. It claimed that by preparing the penicillin for injection by the new method it has been found that a single dose is as effective in the treatment of certain diseases as three doses administered in the usual form

Development of a malarial vaccine, previously shown to be effective in the immunization of experimental animals, has now progressed to the stage where it can be used in human tests, Mr Heyman revealed

He said that at the request of the office of the Surgeon General of the Army special methods for evaluating the nutritional condition of soldiers in the field were devised and introduced into combat areas within a few weeks' time

Microchemical methods also were developed, according to Mr Heyman's report, that led to the discovery of a new enzyme that the body uses to combine certain nitrogen compounds with sugars to form structural parts of cell nuclei These substances are important links in cell physiology and pathology, especially in connection with processes by which cells grow and divide

Sulfa drugs are not effective in decreasing the incidence of common colds, but they are of value in lowering the incidence of complications following colds, it was shown by studies conducted at the institute

The report said that in instances where sulfadiazine was used continuously for several weeks certain strains of bacteria found in the throat became tolerant of the drug and were no longer affected by it

More than thirty detailed reports of scientific work carried on at the institute have appeared in leading scientific journals in the last year, according to Mr Heyman.—*N Y Times, Oct 23, 1945*

HODGKIN'S DISEASE IN CHILDREN

HERMAN CHARACHE, M D , Brooklyn, New York

(From the Brooklyn Cancer Institute, Brooklyn, New York)

HODGKIN'S disease in children is comparatively rare Up to the present writing 233 cases have been reported in the literature

Smith[1] in 1934 reviewed the literature for thirty years, collected 85 cases, and reported 23 additional cases Since 1934, 125 new cases have been reported in the literature as follows Kaplan 16,[3] Davis 2,[3] Limper 0,[4] Goldman 18,[5] Craver 8,[6] Baker 7,[7] Levitt and Weissman 4,[8] McCausland 13,[9] Ritvo, Houghton, and McDonald 11,[10] Wallhauser 33,[11] and one case each by the following writers Langlois,[12] Schwind and Hyde,[13] Branch,[14] and Chiari,[15] making a total of 233 cases of Hodgkin's disease in children To this number we wish to add 11 additional cases from the Brooklyn Cancer Institute

Clinically the disease is more common in males than in females, even to a greater degree than in adults Of the 185 cases reported where the sex was mentioned, 153 (82 7 per cent) occurred in males and 32 (17 3 per cent) in females Eight of the patients were infants between the ages of 2 and 5 months The mothers of three of the infants had Hodgkin's disease before the birth of the children (Branch,[14] Chiari,[15] Priesel and Winkelbauer,[16] and one of the mothers died from it a week after confinement. The mother of one of our patients had Hodgkin's disease before the birth of the homologous twins Five of the reported cases occurred in one of homologous twins without the other twin being affected (Smith,[1] Macklin,[17] Charache[18,19]) Hodgkin's disease in both identical twins was reported by Peacock.[20] There were several instances of Hodgkin's disease affecting more than one member of the same family Hodgkin's disease in Negro children was rare Three cases were reported by Limper and 1 by Craver If tuberculosis is a precursor of Hodgkin's disease, the reverse should be true, as tuberculosis is more prevalent among Negroes But Hodgkin's disease is less prevalent even among the adult Negro population than among the white. Smith states that secondary invasion with tuberculosis is fairly frequently observed in children with Hodgkin's disease He further states that a positive tuberculin test is rare in children with Hodgkin's disease, but that Hodgkin's disease may predispose to tuberculosis, and the two diseases may coexist for years in the same individual Leman[21] (Section on Medicine, Mayo Clinic) studied the subject of "Tuberculosis as a Factor in Hodgkin's Disease." He concludes, "I believe that infection with tuberculosis bacilli does not produce Hodgkin's disease, although the two diseases may be associated" Ewing[22] states that the cause of the disease still remains imperfectly determined, the majority of writers holding that it is not tuberculous However, he concludes that the evidence in favor of the tuberculous origin is nevertheless somewhat formidable

Symptoms

The symptoms at the onset are few or absent The patient usually complains of a swelling in the neck As the swelling becomes more marked, pressure symptoms may occasionally result in dyspnea, dysphagia, or edema of the face The left cervical glands are more frequently involved (Warthin[23]) This is attributed by Feer[24] to the early involvement of the retroperitoneal and mesenteric glands extending along the course of the thoracic duct to the left side of the neck. Symmers[25] states that all Hodgkin's disease cases begin with abdominal involvement and then spread to the other lymph nodes He bases his opinion on autopsy findings at Bellevue Hospital, New York. Of 100 cases tabulated by Smith, 92 cases (92 per cent) originated clinically in the neck Forty-eight involved the left side of the neck, 26 the right, and 18 were bilateral Two affected the axilla, 4 the abdominal and mediastinal glands Two involved the bones of the skull before any other clinical manifestation of glandular enlargement One of our own patients had primary osseous involvement without any other clinical manifestation. The diagnosis was established by autopsy [18] In Kaplan's series, 7 involved the cervical glands, 5 the axilla, and 3 the inguinal glands. Kaplan states that mediastinal involvement is more common in children than in adults, and that asphyxia symptoms are not commonly associated with mediastinal involvement in children. Dyspnea and cough may be present Enlargement of the spleen and to a lesser extent enlargement of the liver is a late manifestation, and is more frequently seen in children, the latter associated with abdominal ascites Cutaneous involvement, according to Smith, is somewhat less common in children than in adults It consists of pruritic, nonspecific lesions of macules and papules with a tendency to lichenification from chronic irritation, and occasional infiltration of the skin with Hodgkin's

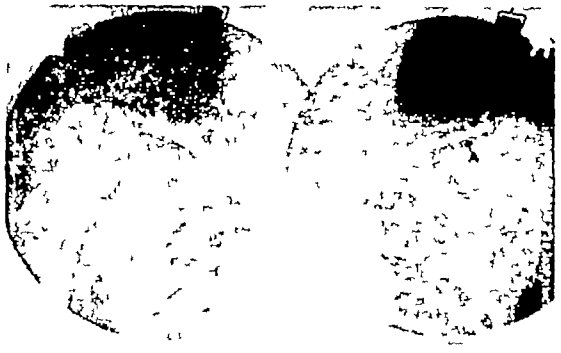

FIG 1 Roentgenogram of primary Hodgkin's disease of (*A*) Clavicle, (*B*) Ilium, in a girl aged 5 Diagnosis confirmed by autopsy

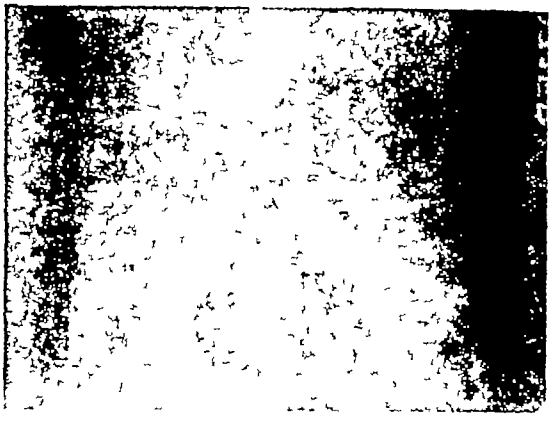

FIG 2

disease Herpes zoster is reported by Limper Two of our own patients had herpes zoster late in the disease

The blood findings are not diagnostic Eosinophilia may be present Anemia is usually the rule in the later stages There is a progressive leukocytosis Leukopenia may occur, and, according to Straube,[26] indicates abdominal or generalized Hodgkin's disease Leukopenia was present in two of our patients

Diagnosis

Although diagnosis of Hodgkin's disease may be made clinically, with comparative ease in some instances, the only positive diagnosis is based on the histologic study of an excised gland, preferably from the cervical or axillary region The inguinal glands are often associated with infection and do not always give a true picture of Hodgkin's disease Removal of one of these glands is often followed by suppuration, which is hard to eradicate Symmers reports one patient (Case 3) who died from secondary infection following the removal of an enlarged inguinal gland for the purpose of diagnosis A similar instance occurred in our own institution in 1936

Treatment

The treatment of choice in Hodgkin's disease is radiation therapy, although some localized lesions may lend themselves to complete surgical excision

Prognosis

The prognosis is very poor, even more grave than in adults According to Kaplan, most of the children die within one year following the discovery of the disease Limper sums up the prognosis as follows "Prognosis in untreated cases is hopeless In acute cases treatment does not offer much Chronic cases, particularly those in which treatment is begun *while the process is localized to one group of* glands, respond well to roentgen therapy, at least for a time" According to Smith, of 41 fatal cases of Hodgkin's disease in children collected in the literature, the average duration was 1 8 years (1 35 in females) In his own group of 16 fatal cases, the duration was 3 45 years He further states that two important factors confuse the evaluation of therapy the variable course of the disease, and the fact that those who come for therapy tend to be those who have a more prolonged course and therefore are able to receive more adequate treatment than the rapidly advancing cases

Case Reports

Eleven cases of Hodgkin's disease in children were observed at the Brooklyn Cancer Institute from 1930 to the present Seven were males and 4 females

The youngest was 3 years, and the oldest was 15 years Three of the patients were one of homologous twins without the other twins being affected. The mother of one of the twins died from Hodgkin's disease All of the children were white. Of the 11 cases, 8 originated in glands of the neck. Of these, 4 originated in the right side of the neck, 2 on the left side, and 2 were bilateral One case had general adenopathy, 1 originated in the left axilla, and 1 had primary skeletal manifestations Six patients had an enlarged spleen, and 4 an enlarged liver on admission. Eight had mediastinal involvement All patients had biopsies Two came to autopsy The blood study of the 11 cases showed a mild eosinophilia in 4 cases One had 5 per cent eosinophiles One of the cases had a terminal leukocytosis of 26,000, while 2 cases had a terminal leukopenia A moderate leukocytosis was present in the rest of the cases

All cases were treated by roentgen therapy The duration of life since the onset of the disease in 8 cases that we have been able to follow was 19 75 months

FIG 3. Primary Hodgkin's disease of axilla in a boy aged 5

Summary

1 Hodgkin's disease in children is comparatively rare

2 Two hundred and thirty-three cases have been reported in the literature up to the present Eleven additional cases are here reported from the Brooklyn Cancer Institute

3 The clinical course of the disease is discussed

SCIENTISTS TELL OF BETTER DRUG TO TREAT MALARIA

American scientists reported on January 3 the development of a new synthetic drug which they said is superior to both atabrine and quinine in the treatment of malaria.

Known as "SN 7618," it relieves acute attacks of malaria three times as fast as the other two drugs, according to the Board for the Coordination of Malarial Studies. In addition, the board said, it can be taken weekly instead of daily to keep the disease in a mild state, doesn t stain the skin as does atabrine doesn t cause buzzing in the ears as does quinine and doesn't nauseate the patient as the other two drugs sometimes do

At the same time the scientists disclosed that an other new drug is offering "definite promise" of being the long-sought actual cure for the relapsing form of malaria—the type with which many returning servicemen are afflicted. They did not identify the drug specifically

Neither drug is available to the public yet. The latter of the two is still in an early experimental stage

Both developments resulted from a $5,000 000 wartime research program in which fourteen thousand compounds were tested in a search for improved weapons against the malady which strikes up to 300,000,000 persons throughout the world annually Conscientious objectors and prison inmates par ticipated as volunteer "human guinea pigs," per mitting themselves to be infected with the disease and treated. Also several hundred thousand ca nary birds, ducks, chickens, monkeys dogs, rabbits and mice were used in laboratory tests.

The first drug has been employed successfully in 5,000 cases of malaria, including more than 1,000 in the armed forces, the scientists said, but they would not recommend its release to civilians generally until further trials had been made.

The work was described as a news conference by the board, an arm of the Office of Scientific Research and Development. During the war, the board coordinated all researches on malaria conducted by military and civilian scientists, mainly prompted by the fact that early Japanese conquest virtually cut off quinine from the United Nations.

The drug, nicknamed "SN 7618 ' because it was the 7,618th drug tested in the four year program is made by linking part of an atabrine molecule with another chemical Its formal name is "7-chloro-4-(4-diethy lamino-1-methy lbutylamino) quinoline '

The names of the scientists were not given.—*N Y Herald Tribune Jan. 5, 1945*

SCLEROSING AND SURGICAL TREATMENT OF VARICOSE VEINS

SOL R HIRSCHMAN, M D , New York City

(From the Hospital for Joint Diseases)

IN THE latter part of 1927, the Varicose Vein Clinic at the Hospital for Joint Diseases was organized and put into full operation Until 1939, varicose veins were treated entirely by the injection method At that time, the high saphenous ligation method was instituted, in addition to the injection treatment Since then, and up to the present, we have used each method, or a combination of both, depending on the particular needs of each patient Experimentation has proved these procedures to give the most satisfactory and most permanent result

The number of patients treated by the injection method at the Joint Diseases Clinic is as follows

	Visits Made by Patients	
1927	no full data available	
1928	no full data available	
1929	10,623	
1930	13,855	
1931	12,925	
1932	10,955	
1933	10,573	
1934	9,638	
1935	9,174	Evening clinic, Monday and Thursday
1936	8,980	
1937	8,574	
1938	7,949	
1939	8,409	
1940	8,510

Those treated by the high saphenous ligation method, single and bilateral, are as follows

	Cases
1939	no full data available
1940	58
1941	85
1942	110
1943	118
1944	107

A study of the data compiled from the records of these cases shows these noteworthy facts When the injection method was used *alone*, there was a noticeable recurrence of varicosities in approximately 65 per cent of the cases treated When the saphenous ligation and injection methods were used *together*, the recurrence of varicosities fell to approximately 3 to 5 per cent Here the recurrence was due to failure to ligate all the communicating branches These findings show clearly the superior results to be obtained from a combination of both types of treatment

The Injection Method—Technic and Solutions

At the outset (1927–1928) we used the following solutions, with the accompanying observations

Sodium chloride, 20 per cent—very effective sclerosing agent, with very little reaction except for immediate cramping pains, just subsequent to the injection, and lasting approximately one-half minute

Sodium salicylate, 30 per cent—effective sclerosing agent, but causing excruciating cramping pains subsequent to the injection (This solution was dispensed with immediately)

Quinine hydrochloride with urethane—an effective sclerosing agent, but dangerous, due to severe reaction of the quinine on patients sensitive to that drug

Invert sugar—reactions and sclerosing too severe

In 1929 we started to use sodium morrhuate, and found it soothing and effective, with no afterpains or reactions, except when used in doses greater than 1 to 2 cc In 1931 we used, alternatingly, sodium morrhuate and sodium ricinoleate, with gratifying results Constant experimentation with solutions led to the conclusion that sodium morrhuate, sodium ricinoleate, or sodium chloride (20 per cent) are most satisfactory They are now standard in our clinic

The most important element in the injection treatment of varicose veins is that once the operator pierces the skin and enters the vein, the syringe and needle must at all times be kept steady, so that there is no puncture through or piercing of the perivenous tissues Perivascular infiltration of a sclerosing agent may cause severe sloughing and develop a deep wound The skin should be sterilized with either alcohol, iodine, or any other antiseptic Steady the vein to be injected by rendering the overlying skin taut between the first and second fingers of the left hand Penetrate the vein at an angle of 30 degrees from the vein, and withdraw the piston until blood appears in the syringe If none appears, withdraw the needle and reinject the vein On completion of the injection, withdraw the needle and compress the puncture with a gauze swab impregnated with alcohol Apply a piece of adhesive strapping

The position of the patient is an important factor, for both cosmetic and sclerosing effect, particularly where larger, thick, tortuous varicosities are involved In these cases, the patient should be put into a recumbent position, the leg elevated, and the blood milked to empty the large varicosities, before injection. Adequate compression is here also particularly important for effective sclerosis A felt or elastic bandage

makes the patient more comfortable and able to remain ambulant

The best needles to use may vary in size from 22 to 25 mm gage, ranging from 3/4 to 5/8 inches These will facilitate firm anchorage and prevent leakage In cases of small spider veins, burst flares, or telangiectatic lesions, a 26 mm gage needle, 1/2 inch in length, is best Here 1/4 to 1/2 cc. of sodium morrhuate or sodium ricinoleate may be diluted with sterile distilled water and drawn into the syringe This solution may be made to become frothy by shaking, and then injected intradermally or, if possible, in the most central vein A number of sites may be injected at one treatment As the solution goes into the small vessels, they will blanch or disappear

Of course, there are allergic manifestations concomitant with the injection treatment of varicose veins Fortunately, there are very few deaths reported in the literature or by various clinics The various solutions used are not free from danger, due to the nitrogenous impurities contained therein I have noticed patients develop severe pains in the lumbosacral and sacroiliac region, with nitritoid reactions. These severe pains lasted, in some instances, from ten to twenty-four hours. There have been skin manifestations, such as urticarial rashes or dermatitis throughout the whole body, or in the extremities There have been cases of shock with pulmonary edema All of these reactions were counteracted with 1/2 to 1 cc of adrenaline (ephedrine hydrochloride) chloride 1 1,000, and relief was almost instantaneous and complete. These reactions may occur at any point in a series of injections They may follow the first injection, or may manifest themselves after the thirtieth injection Small doses of any of the standard solutions may determine the patient's sensitivity at the beginning of treatment. There is no way, however, of determining what patients may become sensitive during the course of treatment. It is of interest to note that the greatest number of cases of sensitivity was found among individuals who *resumed* treatment following a temporary cessation of from one to several weeks The reactions discussed serve always as a warning and a safeguard Treatment should be discontinued, or the solution in use should be replaced by one of the other standard solutions. The solution which has caused the reaction should never again be used for the patient sensitive to it.

Treatment by Saphenous Ligation

After observing the large percentage of recurrence following the injection method, we decided to do both injection and ligation There is, as yet, no panacea for complete obliteration of varicose veins But these two methods provide considerable improvement, far fewer recurrences, and end results more gratifying to patient and doctor Before a patient is subjected to any surgical procedure, he or she is tested for patency of the deep veins by Perthe's, Ochsner's, or Mahorner's test. The patient is then sent to the Medical Department for a complete checkup and urine analysis Should any contraindication to surgery be found, the patient is referred back to the necessary department, so that the condition can be remedied Contraindications to surgery are acute infections, marked arteriosclerosis, thromboangiitis obliterans, pregnancy, incompetent veins (these should be excised completely), infected ulcers, and uncontrolled diabetes The patient selected for ligation is hospitalized if both legs need ligation When only one leg needs ligation, the patient is treated as an outpatient.

The inguinal region and leg are shaved and thoroughly scrubbed, as for any abdominal operation Then the skin is painted with a mercurial preparation and draped The fossa ovalis and its underlying structure are palpated, and from 30 to 80 cc of 1 per cent procaine hydrochloride infiltrated into the deep tissues in a fan-shaped fashion A transverse 2 to 2 1/2 inch incision is made through the skin and fascia. The subcutaneous fat is separated with the fingers or blunt instrument until the saphenous vein is exposed to view The vein is isolated by stripping it free from the sheath and adjoining tissues by blunt dissection Two Ochsner forceps are applied and the vein is cut between clamps. The distal portion is then stripped from its sheath and surrounding tissue, and if tributaries are encountered, they are ligated and cut The distal portion is then injected retrograde with a 3 to 5 cc. solution of sodium ricinoleate, and ligated with No 2 chromic catgut, and transfixed The proximal end is dissected upward, and all the communicating veins are ligated The vein is then ligated as close as possible to the saphenofemoral junction, and transfixed. Then the "dead space" or "weak spot" is obliterated by two sutures to form a block downward of scar tissue to prevent new branches The subcutaneous tissues are sutured with No 0 catgut and the skin with silk. The wound is painted and dressed, and adhesive is applied firmly The wound remains dry and is not dressed for seven days, at which time the skin sutures are removed

It is necessary to bear in mind that these patients are ambulatory, and should be kept so Following the operative procedure, they are allowed, in fact urged, to walk in order to prevent a stagnation thrombus which may make its way through the perforating vein. From past experi-

ence, I have found it more comfortable to apply adequate support, Unna bandage (zinc gelatin) or Ace bandage, immediately following the operation This prevents postoperative pain, discomfort, and edema, and should be worn until all soreness has subsided

The patient may leave the hospital the day following the operation, and may do light work In some cases, severe reactions following the ligation and retrograde injections have caused tenderness, inflammation, and edema in the entire extremity The patient complains of severe pains and difficulty in locomotion These may be due to venous or arterial spasm until the normal circulation is re-established For such cases, rest is required, plus the application of compresses with either Burow's solution or lead opium Pain and edema subside within a few days

Oscillometric readings made before and then a few days after ligation show no change or very little change Venous pressures taken before and after ligation show no appreciable change

Summary

1 High saphenous ligation with subsequent injection treatments greatly reduce the number of recurrences of varicose veins

2 Perthe, Trendelenburg, Mahorner, Schwartz, or Ochsner test should be done preoperatively in all cases

3 Empty-vein treatment is necessary in some cases

4 Segmental ligation is necessary in some cases, after high ligation

5 Perivenous infiltration can be counteracted to prevent sloughing

6 Good compressive support following ligation is essential to prevent severe reactions and discomfort

7 It is important that the patient be kept ambulatory following ligation

8 A small amount of sclerosing fluid is sufficient in the injection treatment

9 Avoid the use of the same sclerosing agent on patients who show sensitivity to it at any point in their treatment

10 Sodium morrhuate, sodium ricinoleate, and sodium chloride, 20 per cent, are the best sclerosing agents for injection therapy

U N R R A FIELD PERSONNEL NEEDED FOR CHINA

The Chinese government has requested U N R R A to provide, as soon as possible, some two hundred field personnel of the following categories to strengthen the available Chinese personnel. Such personnel will be required to head the respective services in hospitals of 100 or 250 beds, which will be established in areas recently liberated from the Japanese

They are general surgeons, orthopedic surgeons, genitourinary surgeons, gynecologists and obstetricians, general physicians, dermatologists and syphilologists, ophthalmologists, otolaryngologists, radiologists, dentists, pediatricians, laboratory technicians, x-ray technicians, sanitary engineers, public health engineers, public health nurses, and clinical nurses

General practitioners with some specialist experience will be acceptable Candidates should be under 55 years of age and in good physical condition Will those interested please write to Dr Szeming Sze at U N R R A, 1344 Connecticut Avenue, N W , Washington 25, D C

GERIATRICS TO APPEAR BIMONTHLY

A new bimonthly medical journal, *Geriatrics*, devoted to research and clinical reports on the processes and the diseases of the aged and aging, appeared in January, Modern Medicine Publications announced

For some time the need for a journal of this type has been increasingly apparent By 1975 it is estimated that 40 per cent of our population will be in the over 50 age group Whatever information serves to increase the life span of the individual, whether a matter of diagnosis and treatment, surgical intervention, or proper nutrition is very much in accord with the thinking of the times The editorial direction of *Geriatrics* will stress the investigations and advances made in the study of geriatrics and report on the clinical applications of new developments

The editor is Dr A. E Hedback, who has been the editor of *Modern Medicine* since its inception The editorial board serving with Dr Hedback consists of a group of distinguished and medical authors and editors, specialists in the field of geriatrics.

PREMEDICATION FOR ANESTHESIA

JAMES P CURRAN, CAPT , (MC)

(From the AAF Regional Hospital, Langley Field, Virginia)

PREANESTHETIC medication is an essential part of any surgical operation It aids in eliminating the apprehension and fear of anesthesia Preoperative medication is given to obtain a tranquillizing effect by depressing the nervous system, decreasing respiratory activity, that is, oxygen consumption, suppressing sensory activity, and as a prophylaxis against stimulation or depression of certain systems The use of routine drugs and dosage without regard for the indication is unjustified When used in this manner it will fail to serve its purpose in a large number of cases, with hazard to the patient and inconvenience to the surgeon

The lowering of reflex irritability and elevation of the pain threshold are important functions of preanesthetic medication The total amount of the drug used to effect and maintain anesthesia is lessened, thus lightening the load on the body in eliminating and detoxifying the agent. The recovery period is shortened with a decrease in postoperative pulmonary or other complications The concentration of the agent necessary to effect the desired plane is lowered This is more significant in the agents with greater potency like ether, chloroform, and cyclopropane Increased concentrations of cyclopropane predispose to circulatory changes Likewise, in the case of the less potent agents, like nitrous oxide and ethylene, their use is heightened by raising the pain threshold and decreasing reflex irritability Reduction of the basal metabolic rate, aside from that produced by elimination of fear, is accomplished by preanesthetic medication

Reflex irritability is the tendency of the body to react after sedation. It is thought to parallel metabolic rate and is influenced by many factors.

Guedel[1] has pointed out the influence of age on metabolic activity He has shown reflex irritability to be high in the first years of life, falling slightly in the next few years, rising to near maximum at puberty, then having a rise to its peak at 45 years of age, and then a gradual decline in old age

Other factors influencing reflex irritability, as emphasized by Waters,[2] are fear, anger, irritability, fever, pain, uncomfortable surroundings or unhygienic conditions, emotional instability, and hyperthyroidism All of these factors increase reflex irritability or metabolic activity and would require more preanesthetic medication than their respective opposites which decrease reflex irritability

Of all the drugs used, the opiates, demerol, atropine, scopolamine, and the barbiturates are the most important. Among the opiates, we consider morphine the most important and usually the ideal choice Morphine[3] produces analgesia, psychic sedation, and depression of metabolism by its central action In its action upon the body it causes a decrease in minute volume of respiration and a depression of respiration, both important factors in inhalation anesthesia This opiate depresses the cough reflex and in large doses abolishes the reflex Morphine abolishes pain and relieves fear and anxiety by production of drowsiness and euphoria Contraction of the pupil of the eye is another effect It causes contraction of smooth muscle and may produce pain by this contraction This effect is brought about by a marked increase in tone almost to the point of spasm. Morphine[4] may be given by three routes subcutaneously, intramuscularly, and intravenously The dose is the same for all routes The variations in the results of the three methods are manifested by the difference in the time of onset of peak action subcutaneously in ninety minutes, intramuscularly in approximately forty-five minutes, and intravenously in fifteen to twenty minutes These facts should be remembered in allowing time for the full action of the drug The use of intravenous morphine is becoming more common, and it should be used in emergency patients when sufficient time is not available for it to be effective when given by any other route, and in the patient having severe pain, to produce relief in a short time It can be used to advantage when the scheduled time for the operation cannot be determined accurately If given intravenously, the drug should be dissolved in 2 cc of sterile water and given slowly at the rate of $^1/_2$ cc per thirty seconds.

Morphine should be used with caution when given subcutaneously to patients who are in shock. In these patients there is poor absorption due to poor circulation and if the dose were large or if it had been repeated because of continued pain, overdosage might be encountered

Demerol,[5] ethyl 1-methyl-4-phenylpiperidine-4-carboxylate, is a fairly new material which may be used for preanesthetic medication. It is a spasmolytic analgesic and sedative agent. It

Home address, 620 Fidelity Building, Dayton, Ohio formerly Amsterdam New York.

possesses both atropine-like and morphine-like properties The spasmolytic action is produced by a depression of parasympathetic endings and a direct depressing effect on muscles The analgesic effect of demerol is midway between that of morphine and codeine It has a slight sedative effect Because of the pleasant effect produced in some patients, caution should be exercised in long-continued use of this material Habituation is not as likely as from morphine, but the possibility should be guarded against The dose of demerol is 50 to 100 mg , given either subcutaneously or intramuscularly It can be used in place of an opiate as preanesthetic medication

Atropine sulfate and scopolamine are used to paralyze the parasympathetic division of the autonomic nervous system Thus, the secretions of the mucous glands of the respiratory passages, certain vagal reflexes manifested by laryngospasm, bradycardia, and a lowering in pulse pressure incident to hyperactive carotid-sinus mechanism are decreased Scopolamine and hyoscine are essentially the same drug Scopolamine and atropine are chemically similar and are usually considered together

Scopolamine has a definite psychic sedative effect and produces amnesia It also produces a greater "drying" effect than atropine Wangeman and Hawk[6] believe that scopolamine should be the drug of choice to use with morphine because it counteracts the respiratory depression of morphine, it is a more effective "drying" agent, produces less circulatory changes, brings greater psychic depression, and is effective in smaller doses From their experimental work on morphine, atropine, and scopolamine, they were impressed with the fact that atropine produced more circulatory changes and had little or no effect on respiration, morphine produced a definite lowering of the minute volume of respiration, and scopolamine increased the minute volume of respired air to counteract the depression caused by morphine Morphine and scopolamine complement each other by countering the bad effects of the other, thereby making an ideal combination It has been found that a ratio of 25 1 of morphine and scopolamine is the most effective ratio, and most desirable effects can be obtained by giving them at least ninety minutes prior to the operation Atropine and scopolamine may be given intravenously with morphine if so desired Some of the unfavorable reactions from scopolamine probably arise from deterioration of the drug, and some authors advise keeping the drug in ampule form Others, however, claim that the tablets keep very well It should always be in solution before administration Apomorphine in subemetic doses of $^1/_{40}$ grains (0 0012 Gm) will counteract the reaction from scopolamine Scopolamine seems to have o further advantage in that when given with mo phine it lessens the nausea and vomiting oft seen when morphine is given alone

The barbiturates produce excellent hypnos They protect the patient against the convulsa manifestation of toxic reaction to cocaine and derivatives This is their main use in pr anesthetic medication The barbiturates a divided into short-, medium-, and long-acti types Their action is very inconsistent in t very young and the aged Chief interest is in t short-acting seconal and nembutal (pentobarbi sodium) They are usually given orally but m be given rectally, particularly seconal, in t young patient The onset of action is with twenty minutes and reaches a maximum in thir to forty minutes When used with morphi they should always be given before morphin since the absorption from the intestine may l delayed by the motor-inhibiting effect of mo phine on stomach and intestine

With certain agents and types of anesthesi a different time schedule and a varied combin tion of drugs can be used With sodium pent thal anesthesia atropine or scopolamine must l given, and morphine and a barbiturate may l given In large robust men, many anesthetis administer all three, however, it is well to r member that barbiturates and morphine a synergistically and may develop a respiratory d pression before the start of anesthesia Scopo amine or atropine may be given thirty minute before anesthesia, but if morphine is added ninety minutes should elapse

In spinal anesthesia, the premedication may b given sixty minutes before the operation and th continued effect of the sedative and opiate wi carry through the operation Patients who are t have inhalation anesthesia should receive the preanesthetic medication ninety minutes pri to onset in order to avoid having the full effect morphine and the inhaling agent reaching the maximum effect at the same time, with a resul ing severe respiratory depression

With local anesthesia, a barbiturate shoul always be given Morphine and scopolamin may be used subcutaneously, sixty minutes befo the local is begun In our hospital we have bee giving the premedication intravenously five t fifteen minutes before the operation

Preoperative medication without a carefu survey of the patient will be of little value check should be made for anemia, disturbance fluid or protein balance, or any other alteration body chemistry Whenever possible, these shoul be corrected before the operation, or if that is no possible, the abnormal changes should be kep constantly in mind Anemia, even if mild, is

potential source of danger in any type of anesthesia, and this cannot be emphasized too strongly

Preanesthetic sedation is a rational procedure and based upon well-established pharmacologic facts Many factors will modify the choice of the drug and the dosage in individual cases Routine prescription without individualization is unsatisfactory The best results are obtained when all factors influencing the patient and operation are analyzed The anesthetist who is familiar with the conditions under which the anesthesia and the operation are to be performed is best fitted to prescribe the preanesthetic medication

LONGEVITY OF THE AMERICAN PEOPLE IN 1943

The average length of life of the American people in 1943 as computed from the mortality then current, was 64½ years, or only one third of a year less than the peak reached in 1942 These figures reflect the experience of the entire population within the United States, both civilian and military but the data exclude the experience among men and women serving overseas and elsewhere beyond the borders of our country

The slight setback in longevity during 1943 was due in large measure to the high toll taken by the influenza epidemic which swept the country toward the close of that year Two other factors played a major role in reducing the average length of life of the resident population, particularly among white males during our second full war year In the first place, very large numbers of the healthiest males at the prime ages of life were withdrawn for service overseas in 1943, so that they were excluded from the experience. Secondly among the young men still in the country there was a sharp rise in mortality from accidents, especially in connection with military aviation. As a result, the average length of life of white males on the basis of mortality conditions in 1943 was reduced to 63 16 years, one half year less than in 1942. For white females with an average of 68.27 years, the corresponding reduction was only one third of a year

Among colored persons the change in experience from 1942 to 1943 was more favorable than among the white Colored males with an average of 54.65 years in 1943 gained almost two fifths of a year while the figure for colored females remained practically unchanged at 58 years.

So slight was the setback in 1943 for the population as a whole that the record for the year still compares very favorably with that for prewar years. The average length of life (expectation of life at birth) in 1943 was three-quarters of a year above the figure for 1940, five years better than that for 1930 and 15¼ years greater than the average at the beginning of the century The gain since 1900 was greater for females than for males, and more pronounced for colored persons than for the white. The increases were white females 17 19 years, white males, 14.93, colored females, 22.93, and colored males 22.11 years.

Changes similar to those noted for the expectation of life at birth are found also at a wide range of ages.

The details of the life table for 1943 present some noteworthy features. The expectation of life for white girls 8 years old is just as great as that for newly born white males. The superior longevity of females is also evident from the fact that, whereas nine out of ten white male babies are expected to survive to age 32 among white females the same proportion will live to 43 years.

Longevity among colored lives still lags substantially behind that for white persons. For example, the average length of life for the colored in 1943 was less than that for white persons in 1919–1921

In 1943 the expectation of life at birth for colored persons was about the same as that for white persons 13 years of age. Similarly, nine out of ten of the colored males will survive from birth to age 16, and a like proportion to age 21 for colored females these ages are only half the corresponding ages observed above for white males and females.

For the wide range of ages from 16 to 42 years, the mortality rates for colored females were fully three times those for white females, while from ages 43 to 60 the rates were twice as great. At ages 12 to 15 also colored girls were subject to a mortality double that for white girls. Among males the rates for the colored were at least twice those for white lives from ages 26 to 51 The facts clearly indicate that there is substantial room for improvement in the mortality and longevity of the colored population

There are indications, from provisional data available so far, that in 1944 the American people had recovered, in part, from the setback which they experienced during 1943 and that the situation so far in 1945 is also favorable. Our nation has been singularly fortunate that its civilian population has escaped the ravages of war, with its attendant misery, want, and death. As the war in Europe draws to a close, the prospects are good for continued improvement in longevity —*Statistical Bulletin, April, 1945*

TREATMENT OF MIGRAINE AND RELATED HEADACHES

MAX A GOLDZIEHER, M D , New York City

(From the Endocrine Clinic, St Clare's Hospital)

IN A previous paper,[1] a series of 50 cases of severe headaches, mostly of the migraine type, was presented and it was shown that a trend to retain sodium chloride and water was a common characteristic of these patients Migraine and other severe headaches, frequently met with in patients affected with varied endocrinopathies, were interpreted as the result of increased intracranial pressure which develops if abnormal permeability of the capillaries permits an increased flow of water to the tissues Retention of water with swelling of the intracranial tissues occurs in case the sodium content of the tissues is abnormally high According to this interpretation, migraine and related headaches are incidents in the course of a metabolic disorder, precipitated by a vasomotor upset which is initiated by widely variable and nonspecific causes

It does not need special emphasis that headaches may also be brought on by a variety of unrelated causes, yet the "metabolic" type is one of the most common headaches Its recognition is fairly simple it can be identified by the salt-tolerance test, which consists of estimation of the twenty-four-hour sodium chloride and water output on two consecutive days Food and liquid intake is identical on both days A test dose of 10 Gm of sodium chloride is given with 250 cc of water after breakfast on the second day Once the nature of the headache is identified, a simple treatment is successful in the vast majority of patients It consists of (1) dietary measures, (2) medication intended partly to remove the retained sodium chloride, and (3) partly to decrease the abnormal irritability of the vasomotor system

A group of 100 consecutive cases, part of a larger material, is presented at this time to supplement our previously published observations

This group of 100 cases consists of 20 male and 80 female patients Their ages ranged from 15 to 62, with the following distribution

	Under 20	20–29	30–39	40–49	50 and Over
Female	6	15	36	17	6
Male		4	7	5	4
Total	6	19	43	22	10

The majority of these patients came solely with the complaint of severe headaches, many had received varied treatment over a number of years without benefit Other patients complained, in addition, of overweight or menstrual disorders

The salt tolerance test gave the findings that appear in Table 1

TABLE 1 SALT TOLERANCE TEST IN 100 CASES

Urine Volume	Control Day	Test Day
Total average	1,160 cc	1,008 cc
Range	375 to 2580 cc	330 to 2 280 cc
Oliguria (< 1,000 cc)	38 per cent	46 per cent
Average retention		315 cc
Percentage showing retention		90 per cent
Percentage showing no retention		10 per cent
Sodium Chloride in Urine	**Control Day**	**Test Day**
Total average	7 85 Gm.	10 56 Gm.
Range	1 6 to 21 7 Gm	3 0 to 23 0 Gm
Distribution		
(a) 5 Gm or less	31 per cent	
(b) 5 Gm to 10 Gm	52 per cent	
(c) > to 10 Gm.	17 per cent	
Percentage		
(a) Showing no retion		10 per cent
(b) Retaining < 30 per cent		6 per cent
(c) Retaining > 30 per cent		84 per cent

Thirty-eight per cent of the group manifested definite oliguria, i e , an output of less than 1,000 cc per day The twenty-four-hour urinary output of the whole group averaged 1,160 cc, ranging from 375 to 2,580 cc

The twenty-four-hour sodium chloride excretion averaged 7 85 Gm , with a range of 1 6 to 21 7 Gm The excretion was 5 Gm or less in 31 per cent and above 10 Gm in 17 per cent of the group

On administration of the test dose of 10 Gm of sodium chloride and 250 cc of water, the twenty-four-hour urine output averaged 1,008 cc with a range of 330 to 2,280 cc However, *46 per cent of the group excreted less than 1,000 cc of urine* The water retention, including the added 250 cc water intake, averaged 315 cc *Only 10 per cent of the group showed no retention*

The excretion of sodium chloride following the intake of the test salt varied from 3 0 to 23 Gm , with an average of 10 56 Gm , which is only 2 71 Gm more than the average excretion on the control day Thus, the retention amounts to 7.29 Gm , or 72 9 per cent of the test salt given. Only 10 per cent of the group showed no retention, while in another 6 per cent the salt retained was less than 30 per cent of the test dose Substantial amounts were retained in the other 84 per cent of the group, including some of the

patients who did not retain water The averages calculated tally remarkably well with those previously published, especially in respect to sodium chloride retention, which was identical (73 per cent), while water retention averaged 315 cc., as compared with 343 cc in the earlier series.

The vasomotor instability of the headache patients was gaged by their response to gentle stroking of the skin with a blunt instrument. The dermographism, tested on the abdominal skin, was usually quite marked and showed up almost invariably in the form of a white line Only a minority of the patients reacted with red dermographism, which usually faded rapidly and gave way to the appearance of white lines

The therapeutic procedures used can be summarized briefly as follows (1) a high-protein diet, of about 1,100 calories in the overweight patient, with commensurate increments by the addition of fat in the average or underweight patient, (2) limitation of carbohydrates to 5 and 10 per cent of vegetables and fruit with the addition of two slices of bread per day, (3) restriction of liquid consumption to 1,500 cc. per day, and (4) elimination of salt intake as completely as possible.

The medicinal treatment consisted of ammonium chloride, 7½ grains of enteric-coated tablets, three times daily for one week, alternating with potassium acetate, 7 per cent solution, one tablespoon, or 7½ grains of potassium gluconate three times daily for a similar period. Simultaneously, atropine sulfate, $^1/_{200}$ to $^1/_{100}$ grains with $^1/_4$ to $^1/_3$ grains of phenobarbital, was given two to three times a day This basic therapy was combined in some patients with the administration of thyroid extract or with injections of anterior pituitary or sex hormones, if such treatment seemed indicated by additional symptoms Injections of posterior pituitary extract were used in a number of cases to take advantage of the increased sodium chloride excretion which follows the short-lived antidiuretic effect of the posterior pituitary hormone.

The therapeutic response, as a rule, became apparent within the first two weeks of the treatment, for the frequency of the headaches decreased and their severity diminished progressively

Complete cessation of the treatment was, as a rule, continued for a period of three months. Thereafter, patients were advised to observe the basic features of their diet, that is, limitation of liquid, salt, and carbohydrate intake, whereas the medication was discontinued

A large number of the patients so treated have remained permanently free of headaches. Some patients returned for further treatment but admitted that the recurrence of their complaints could be traced to dietary indiscretions

The therapeutic results of the 100 cases presented were as follows

Completely cured	44
Greatly improved	25
Improved	21
Unimproved	10

The group of "greatly improved" patients includes those whose frequent severe headaches became incidental and quite mild Patients were listed as "improved" if the frequency and severity of their headache decreased definitely, but with enough residue left to preclude the claim of a cure This group included a number of patients whose headaches had been limited to the time of the menstrual period and who continued to have menstrual headaches The number of outright failures was 10 per cent Three of these patients should not have been included in the group because the evidence of salt and water retention was inconclusive. One of these patients had a 3 plus Wassermann and neurologic signs suggesting cerebrospinal syphilis Three other patients admitted violation or disregard of their diet. Two of the failures were in severely neurotic women whose complaints might have been due to, or at least aggravated by, psychogenic factors. Another patient, who at first responded strikingly, sustained a recurrence which proved to be refractory to repetition of the treatment, but subsided completely upon removal of a cystic ovarian tumor

Comment

The mechanism by means of which salt and water retention causes headaches was discussed in detail in previous publications.[1-3] The pathogenesis of the retentional phenomenon is rather complex, though only two factors stand out as essential

1 Vasomotor hyperirritability from time to time permits an increased flow of plasma from the capillaries into the tissues Psychogenic influences, nervous strain, emotional difficulties, overwork, and various other factors are capable of increasing the irritability of the vasomotors and thus precipitate a sudden increase in capillary permeability with the resulting sudden hydration of the tissues.

2. The metabolic disorder, i e., the abnormal and selective storage of sodium chloride in the cells or connective tissue fibers, is responsible for the increased hydrophilia of the tissues and their inability to release the water into the circulation This disorder develops either in the course of faulty nutrition or upon failure of the endocrine regulation of salt and water metabolism

The hormonal factors which influence the salt and water content of the tissues were reviewed in previous papers [1-4] Evidence is ample that the thyroid, the adrenal cortex, both lobes of the pituitary, and the ovary, as well as the pancreatic islands, contribute to the maintenance of the physiologic status, which is likely to be upset by hormonal deficiencies or a relative excess of one of these hormones This is illustrated by the often striking retention of water in endocrine diseases such as myxedema or hyperinterrenalism, or upon administration of insulin, pitressin, estrogen, or desoxycorticosterone Inability to retain water is characteristic of other endocrinopathies, i e , diabetes insipidus, Addison's disease, and hyperthyroidism, while marked diuretic effects are obtained by administration of thyroxin, parathormone, or adrenalin

Dietary factors figure in the pathogenesis of the metabolic disorder not only because of an excessive intake of salt and water but also by virtue of the response of the endocrine glands to some constituents of food Thus, proteins are potent stimulants to the thyroid, pituitary, and adrenal cortex A high-protein diet, moreover, is definitely diuretic, partly due to its purine content and partly to stimulation of the endocrine glands Carbohydrate intake, on the other hand, is antidiuretic, apparently by eliciting increased secretion of insulin These considerations explain the necessity of enforcing the high-protein-low-carbohydrate diet

The treatment of headaches and especially of migraine, aimed at the correction of disordered salt and water metabolism, so far has not met with acceptance, nor have our previously published findings on which this treatment is based found either confirmation or refutation The present, larger series of cases is reported to provoke the long-overdue checkup by other investigators The prevalent methods of treatment have not been eminently successful and remain largely on the symptomatic plane The treatment of headaches proposed in this paper is simple, successful in the large majority of cases, involves no risks, and is not even complicated by the untoward reactions commonly incurred with the palliative use of gynergen Hence, it is hardly justified to withhold effective relief from a large number of suffering human beings simply because the metabolic concept of headaches presented in this paper does not coincide with prevalent theories

Summary

A series of 100 cases of severe headache, mostly of the migraine type, is presented and evidence is submitted that such patients retain sodium chloride and water

The majority of patients affected with severe headaches show signs of a metabolic disorder which can be diagnosed by the salt-tolerance test and demonstration of salt and water retention

The retentional type of headache responds in the large majority of cases to a simple treatment consisting of a high-protein diet with restriction of salt, water, and carbohydrate intake and to medication with ammonium and organic potassium salts Sedation with a mixture of atropine and phenobarbital is also necessary Added therapy with endocrine preparations should be considered if warranted by evidence of endocrine deficiencies

DUTCH DOCTORS TELL OF WORK DURING WAR

During the war in Europe, the 6,000 Dutch physicians in the Netherlands formed that country's strongest resistance group and at the same time accomplished several medical inventions, Dr J C Verschure and Dr A C Lips, both of Nijmegen, reported on October 18, 1945 They were here on a visit sponsored by the Department of Social Affairs of the Dutch Government

The two Dutch physicians, specialists in internal diseases, arrived recently for a visit of several months to study medical progress in the United States, and in return to describe to American medical groups the inventions and developments that Dutch physicians and research men achieved during the years of German occupation

An "artificial kidney" that pumps toxic blood from a patient, purifies it, and returns it to the body, is outstanding among these Dutch inventions that were developed unknown to the German occupying forces

Other medical inventions that the physicians will describe, and in some cases, demonstrate, before American medical men include a specially adapted glass cabinet, eliminating uncomfortable apparatus, in which a patient may take a basal metabolism test, a "clinical calculator," or physician's slide-rule, developed by Dr Lips, for readily computing medical tests, and a device for reading electrocardiographs

NEOSTIGMINE IN DISORDERS OF THE COLON

MILTON H MORRIS, M D , and ABNER ROBBINS, M D , Far Rockaway, New York

(From the Medical Service, St Joseph's Hospital)

NEOSTIGMINE was first introduced in medicine in 1939 Since that time the therapeusis of the drug has been widely applied. Its value in providing relief of fatigue of skeletal muscles in myasthenia gravis has been well established The work of Kabat and Knapp[1] in poliomyelitis showed that neostigmine produced relaxation of muscle spasm relief from pain, increase in strength, and improvement in muscle coordination. Its use has been further widely applied to those individuals suffering from chronic neuromuscular disability, who have not responded to routine therapy, including a diverse group of cases resulting from muscle spasm and muscle hypertonus. The mechanism and physiology of neostigmine in the above pathologic states is explained on the basis of the inhibitory ability of neostigmine on cholinesterase in body fluids and tissues. This esterase is responsible for the rapid and continuous destruction of acetylcholine whether the latter is produced physiologically as a result of the cholinergic nerve impulse or injected into the body by the physician. By preventing the rapid hydrolysis and inactivation of acetylcholine, neostigmine allows the latter to exert in an intensified manner all of its characteristic action. These include not only the nicotinic actions of acetylcholine on skeletal muscles and autonomic ganglia but also the muscarinic effects of acetylcholine on smooth muscles, glands, and the heart.

This line of investigation and clinical use has been applied only to disabilities associated with the mechanism of skeletal muscle. The pharmacologic action and the clinical application of neostigmine in disorders of smooth muscle have been entirely omitted. This muscarinic effect on smooth muscle follows the same biologic mechanism of the drug in its inhibition of cholinesterase with the preservation of acetylcholine as it does on skeletal muscle.

Pathologic Anatomy of Disorders of the Colon

Moore[2] describes two types of nonorganic disorders of the colon (*a*) a motor type also known as spastic or irritable colon, and (*b*) a secretory type known as mucous colitis. Anatomic studies show little. There is, typically no inflammation, although in the active secretory stage there may be hyperemia and slight edema. The mucosal glands are distended with mucus.

The colon receives its nerve supply from both the parasympathetics and sympathetics, as described by Pottenger[3] The parasympathetic fibers to the colon and rectum may be from two sources the ascending portion and probably as far as the descending colon are supplied from the connector fibers of the vagus through the plexus solarius, and the remaining portions of the colon proper the sigmoid, and rectum receive their connector fibers from the sacral portion of the cord through the pelvic nerve (nervus erigens) and plexus hemorrhoidalis

The motor cells for these structures lie on or in the wall of the gut. Sympathetic connector fibers for the colon come through the lower thoracic and upper lumbar segments of the cord. Those which supply the cecum, appendix, and ascending and transverse colon find their motor cells in the superior mesenteric ganglion while those which supply the descending colon, sigmoid, and rectum are in the inferior mesenteric ganglion The nerves from the descending colon probably arise from the left half of the cord

Stimulation of the pelvic nerve causes both a contraction of the muscles of the colon and an increase in its glandular activity, whereas sympathetic stimulation relaxes the musculature, except the internal and external sphincter, which it activates, and lessens the secretions of the glands.

I desire to report 2 cases showing the effect of neostigmine on functional disorders of the colon

Case Reports

Case 1 —J L. aged 38 years, is married and has two healthy children Her past history is irrelevant to the present complaint. For the past six years she has complained of abdominal distension and pain in the left side of the abdomen This was not constant When it did occur the patient was considerably distressed and associated it with flat stools. She has maintained good health during these years. Complete laboratory studies were negative. She was treated with diet, atropine barbiturates, vaccine and physiotherapy, without relief Neostigmine bromide, N N R. (15 mg) was given by mouth three times a day one-half hour before meals. At the end of the second week the patient was considerably improved, with no further passage of ribbon-like stool and no pain. This improvement has continued for three months under the above regimen, the longest period she has been free from symptoms.

Case 2 —Mrs R. T aged 48 years, well nourished has had intermittent diarrhea for the past ten years associated with abdominal discomfort and pain in the left side of the abdomen. These symptoms are unrelated to the type of food and the time of eating She is also troubled with palpitation and flushes and has had amenorrhea for the past two years She has been completely studied with negative findings and was treated with diet, atropine barbiturates estrogens, and vitamins with no relief On the above medication she has been completely free of symptoms relative to her colon, but she still has her symptoms of nervous instability even these are present to a less degree.

Discussion

In order to more closely associate with the foregoing thoughts the psychosomatic aspects of nonorganic disorders of the colon must be considered. The manifestation of functional disorders of the colon is a bodily reaction rather than a disease entity Most of the patients of this type suffer from constipation or diarrhea with some form of abdomi-

nal pain. In most cases the stools are either mushy or composed of hard pellets, as described by Weiss and English [4] As a rule, the symptoms are seen in patients who have a labile autonomic system and who have at the same time evidences of autonomic instability It is this group of patients who are universally misdiagnosed and mistreated after having gone through multiple treatments and not occasionally being operated upon for chronic appendicitis or disturbed functioning of the gallbladder, only to be told after a long trial that they have colitis and there is nothing further to be expected or done for them

The majority of these patients are neuropathic, with a disturbed balance between the delicately adjusted sympathetic and parasympathetic systems Their desire to help themselves is futile, and although there is no organic disease of the colon, there is organic disease of the autonomic nervous system in the form of altered physiology, this physiology being an altered state of the cholinergic fibers of the colon, and the inability of these cholinergic impulses to inactivate cholinesterase Thus, the use of neostigmine in the treatment of nonorganic disorders of the colon bears the same relationship in correcting altered physiology of the colon as it does in correcting altered physiology in many neuromuscular conditions

ACUTE SYPHILITIC NEPHROSIS TREATED WITH PENICILLIN

DELAVAN V HOLMAN, LT COL, (MC), AUS,* AND IRWIN H MAKOVSKY, MAJ, (MC), AUS

(From the Theater Service Forces, European Theater)

SYPHILIS of the kidney was recognized before the time of Bright,[1] but very few adequately described individual cases are available In 1935, Hermann and Marr[2] collected 31 mixed cases, added three of their own, and submitted a classification They divided syphilitic nephropathies into two main groups "Group I" conforms to the clinical syndrome of so-called pure, lipoid, or Epstein nephrosis, and "Group II" is composed of other known lesions, which include glomerular and interstitial nephritis, gumma of the kidney, and syphilitic amyloidosis

Of Hermann and Marr's[2] 34 cases (31 collected, 3 new) 2 were albuminuria without clinical nephrosis, 24 were nephroses (11 "acute," 7 "subacute," and 6 "chronic"), 2 could not be classified, and 6 were Group II More recently Patton and Corlette[3] have described three more examples of acute nephrosis, and Klein and Porter,[4] one Baker[5] reported one each of nephrosis and nephritis, but unfortunately both cases had alternate causative factors which make their diagnosis inconclusive

When the figures quoted in this sample are analyzed, it is apparent that the nephrotic syndrome is encountered at least four times as often as other syphilitic renal lesions combined Acute nephrosis, occurring during late primary and secondary syphilis, is twice as common as subacute or chronic forms If anything, the relative incidence of the acute syndrome may be underestimated It is well known that simple albuminuria is not uncommon in early syphilis [2] The mechanism of production is probably the same as nephrosis, and it is likely that mild or transient stages of nephrosis abort or pass unnoted, in treated cases

In view of recent progress in the treatment of syphilis with the advent of penicillin, it seems appropriate to describe another case of acute syphilitic nephrosis Penicillin is the first antisyphilitic agent to be made available which is not nephrotoxic Its use in the case seemed an unusual opportunity to test its spirocheticidal action and at the same time to observe, unhindered by renal irritants, the natural process of recovery in acute nephrosis

Case Report

A Negro, 23 years of age, was admitted to hospital on November 8, 1944 complaining of facial swelling, loss of appetite, nausea and vomiting, dizziness, generalized weakness, and paraumbilical pain. The onset was two days before admission, beginning with swelling of the eyelids, and followed in twenty-four hours by the other symptoms Prior to onset, his health had been excellent, without history of cardiovascular-renal diseases or associated illnesses He had had an acute gonorrheal urethritis in 1943, presumably treated successfully

Unprotected sexual exposure occurred thirty-five days before the onset of illness During the interval he had not noted a chancre and was, in fact, unaware of the secondary-type genital lesions present on first examination.

The soldier walked into the hospital. There was puffiness of the face and tenseness of other tissues, but there was no gross edema in dependent sites or demonstrable collections of free fluid. Several typical syphilitic condylomata were found on scrotum and penis, and there was a moderate generalized lymphadenopathy The heart, lungs, blood pressure, ocular fundi, liver, and spleen were normal. There was no dyspnea or venous congestion

A 2-meter x-ray of the chest, an electrocardiogram, and a basal metabolism determination were normal

* Home address, 660 Madison Avenue, New York City

The urine boiled solid (4 plus albuminuria) but only a very few red cells and hyaline casts were found in the centrifuged sediment.

Total blood plasma proteins (4.3 mg. per cent) were reduced, albumin (0 5 mg. per cent) relatively more so than globulin (3 8 mg. per cent) (albumin-globulin ratio 0 13) Fibrogen was 0 72 mg. per cent. Cholesterol and chlorides were normal. Nonprotein nitrogen was 32 mg. per cent, urea nitrogen, 4.5 mg. per cent, creatinine 1 3 mg. per cent, and uric acid 2 5 mg. per cent. The erythrocyte sedimentation test was considerably increased The blood count was normal red cells, 4,740,000, 95 per cent hemoglobin, white cells, 7,950, with 75 per cent polymorphonuclear leukocytes, 21 per cent lymphocytes and 4 per cent mononuclear cells.

The blood serology two days after admission was positive with 40 quantitative Kahn units.

The patient was kept under observation five days (November 8–13) at bed rest, with a diet low in salt and high in protein. Fluid balance, visible edema, body weight, albuminuria, and serum proteins (Fig. 1) did not change appreciably during this period.

On the afternoon of November 13, intramuscular penicillin injections were commenced, at three-hour intervals, for sixty two consecutive doses (total dose, 2 400,000 units) Each injection was 40 000 units except the third and fourth, respectively which were reduced to 20,000 because of transient fever (102.2 F) between the second and third injections. In treating primary syphilis with penicillin, a similar early febrile reaction has been the rule and no ill effects have been observed from continuing the full course uninterrupted. The dosage was reduced in the present instance because of depleted plasma proteins.

The effect of treatment was first apparent on the fluid balance (Fig. 1) Diuresis reached its maximum on the sixth day of treatment and a total of 13 pounds of body weight was lost. Albuminuria cleared promptly (Fig. 1) but lagged slightly behind diuresis, judging from relatively crude quantitative estimations After the fifth day of treatment, the urine was free of albumin, and total plasma proteins were probably within the normal range. The sudden improvement in total plasma proteins between the fourth and eighth days was largely accomplished through the globulin fraction (Fig. 1) Albumin increased more gradually On the eleventh day, the albumin-globulin ratio was 0 9, and between the eighth and sixteenth days globulin actually decreased from 4.5 mg per cent to 2 3 mg. per cent, while albumin increased from 2.2 mg. per cent to 4.2 mg. per cent, giving a final normal ratio of 1.8.

The clinical course under treatment was uneventful except for the early febrile episode described All symptoms abated except weakness, recovery from which roughly paralleled the serum-albumin line (Fig. 1) In the third week physical examination blood chemistry and renal function (Mosenthal test) were normal, soon after he was sent to full duty, apparently cured, so far as his nephrosis was concerned.

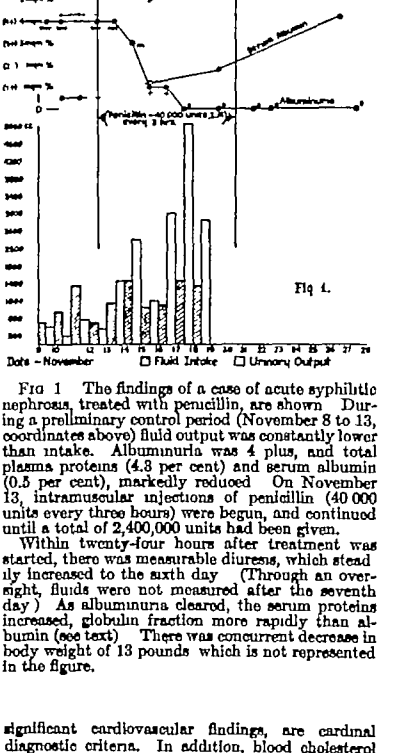

Fig 1.

FIG 1 The findings of a case of acute syphilitic nephrosis, treated with penicillin, are shown During a preliminary control period (November 8 to 13, coordinates above) fluid output was constantly lower than intake. Albuminuria was 4 plus, and total plasma proteins (4.3 per cent) and serum albumin (0.5 per cent), markedly reduced On November 13, intramuscular injections of penicillin (40 000 units every three hours) were begun, and continued until a total of 2,400,000 units had been given.

Within twenty-four hours after treatment was started, there was measurable diuresis, which steadily increased to the sixth day (Through an oversight, fluids were not measured after the seventh day) As albuminuria cleared, the serum proteins increased, globulin fraction more rapidly than albumin (see text) There was concurrent decrease in body weight of 13 pounds which is not represented in the figure.

Discussion

Although true lipoid nephrosis is not a common disease its clinical features are familiar The combination of subcutaneous edema with gross protein uria and critically reduced plasma proteins in the absence of hypertension, hematuria, anemia, and significant cardiovascular findings, are cardinal diagnostic criteria. In addition, blood cholesterol may be elevated, basal metabolism lowered, and lipoid bodies may be present in the urinary sediment.

Syphilitic nephrosis is differentiated from idiopathic nephrosis by associated evidences of syphilitic infection, and by a positive complement-fixation test. Authorities agree that syphilitic nephrosis is cured by specific therapy and idiopathic is not. In fact, idiopathic nephrosis is usually made worse by heavy metals a potentially disastrous side action not shared by penicillin.

If antisyphilitic treatment is withheld acute syphilitic nephrosis may take one of two courses it may lapse into a subacute or chronic stage,[2] or it may spontaneously remit [3]

Diagnosis in the case presented was no problem and penicillin was theoretically an ideal therapeutic agent for the disease Its effects were immediate definitive, and hence compatible with strong spirocheticidal action The febrile episode described

may be considered corroborative evidence, characteristic of treating early syphilis. It is not attributable to penicillin itself, and may in fact be a true Herxheimer reaction

The anatomic and functional derangement in syphilitic nephrosis is obscure Kidneys studied at postmortem[1] have invariably been exposed to potentially poisonous amounts of arsphenamine or mercury, and because these drugs are notoriously nephrotoxic it is impossible to interpret the pathology There is no proof spirochetes must enter renal tissue to produce syphilitic nephrosis Organisms have been observed in tissue sections and recovered from the urine of living patients with the disease On the other hand, they have also been demonstrated in patients who have syphilis without nephrosis,[1] and spirochetes are not invariably excreted by syphilitics with nephrosis [2] For these and other reasons, Epstein and other investigators believe lipoid nephrosis is primarily a metabolic disease

Concerning the case reported here, certain facts are worthy of brief comment, although the sample on which they are based is obviously inadequate Evidence of recovery appeared sooner and was completed before it would ordinarily be expected if it were dependent upon repair of a primary renal lesion of such apparent severity Then the time relationship between regeneration of plasma proteins and disappearance of albuminuria on the one hand, and clinical recovery on the other, suggests cause and effect This correlation is in line with present-day concepts of the regulation of intravascular osmotic pressure, its time and rate of appearance suggest restored ability to metabolize proteins, rather than reduced renal permeability

Precocious regeneration of globulin fraction has been noted following hemorrhage,[6] and it is tempting to draw an analogy between hypoproteinemia from hemorrhage and the present case Further studies with laboratory facilities not available in a theater of operations will discover whether or not it is justified

Summary

1 A case of acute syphilitic nephrosis is reported, and its successful treatment with penicillin described

2 Because penicillin has a negligible host reaction it has special advantages in treatment of syphilis complicated by nephrosis By the same token, nephrotoxic antisyphilitic drugs are contraindicated, when penicillin is available.

3 A plea is entered for careful observation of future cases of syphilitic nephrosis treated with penicillin, because thereby, valuable information may be expected concerning the nature of lipoid nephrosis

VICERAL LEISHMANIASIS

Frank Kaminsky, Maj ,(MC),AUS, Brooklyn, New York, and George K Wever, Maj , (MC),AUS, Stockton, California

(*From the Medical Service of the Borden General Hospital, Chickasha, Oklahoma*)

A PRIVATE, white, age 26, having served two and one half years in the airborne infantry of the Army of the United States, was admitted to Borden General Hospital on September 10, 1944, because of fever of undetermined cause associated with marked enlargement of the liver and spleen

Past History—Except for measles in childhood, his health had been excellent until the onset of his present illness He had spent all of his life in the state of Oklahoma until induction into the service on January 8, 1942 In early October, 1942, he left for overseas and served in England for one month Following this, he was transferred to the North African Theater and was stationed in Algiers, French Morocco, and Tunis from November, 1942, until September, 1943, engaging in training activities In September, 1943, he was shifted to Sicily and remained there for a two-week period He then moved on to Italy and was located there from late September, 1943, to June, 1944, when he was evacuated to the United States because of his present illness No history of gonorrhea or syphilis could be obtained from the patient

Present Illness—About mid-November, 1943, while engaged in combat duty in Italy, he noted the onset of slight, productive cough, fever, anterior chest pain, nausea, and vomiting after meals He was admitted to an evacuation hospital, where he remained for several days He was then transferred to a convalescent center and after one month's stay was returned to duty much improved.

Feeling well, he was able to engage in the Anzio beachhead landing Shortly thereafter, on January 28, 1944, he again noted the onset of nausea, vomiting after meals, slight headache, fever, cough, and mild anterior chest pain, which persisted for several days He was admitted to an evacuation hospital on February 3, 1944, and since that date hospitalization has been continuous Clinical and x-ray findings were those of primary atypical pneumonia in-

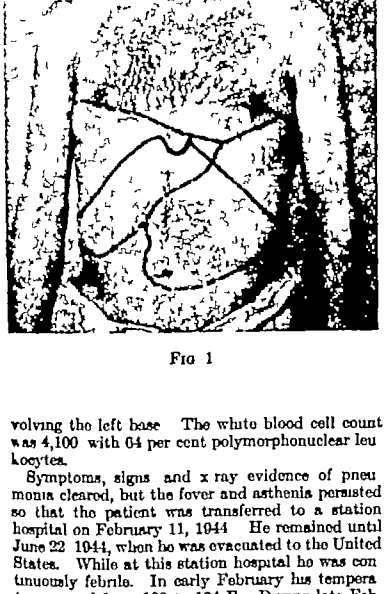

FIG 1

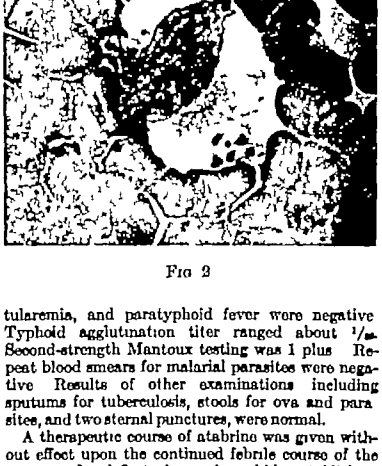

FIG 2

volving the left base The white blood cell count was 4,100 with 64 per cent polymorphonuclear leukocytes.

Symptoms, signs and x ray evidence of pneumonia cleared, but the fever and asthenia persisted so that the patient was transferred to a station hospital on February 11, 1944 He remained until June 22 1944, when he was evacuated to the United States. While at this station hospital he was continuously febrile. In early February his temperature ranged from 103 to 104 F During late February and March it tended to fluctuate between 99 and 101 F Through April May, and June his temperature developed wider swings ranging between 98 and 101 F and at times dropping to 97 F His pulse was at all times proportionate to his temperature. Respirations were normal. Symptomatically he complained of weakness malaise feverish feeling, and variable appetite, he sustained a weight loss of twenty pounds while at this station hospital. Physical examination yielded evidence of a mild anemia and a somewhat enlarged liver and spleen.

Numerous laboratory procedures were carried out in an attempt to arrive at a diagnosis Repeated blood counts showed a mild anemia with red blood cells averaging 4 000 000 and hemoglobin 70 per cent (Sahli) Persistent leukopenia was present the white blood cells fluctuating between 2,300 and 6 000 The differential count gave polymorphonuclear leukocytes and lymphocytes about 50 per cent. No immature white blood cells could be demonstrated in the peripheral blood. Reticulocytes blood platelets, bleeding and coagulation times were repeatedly normal Numerous blood cultures were negative. Blood proteins were normal except on one occasion when the total protein was 9 Gm.—albumin 3 7 Gm. and globulin 5.3 Gm. Agglutination tests for undulant fever, typhus, tularemia, and paratyphoid fever were negative Typhoid agglutination titer ranged about 1/80. Second-strength Mantoux testing was 1 plus Repeat blood smears for malarial parasites were negative Results of other examinations including sputums for tuberculosis, stools for ova and parasites, and two sternal punctures, were normal.

A therapeutic course of atabrine was given without effect upon the continued febrile course of the patient. No definite diagnosis could be established though lymphoblastoma or subacute bacterial endocarditis were favored. The persisting clinical picture of fever, weakness, splenomegaly, and hepatomegaly over several months warranted transfer to the Zone of the Interior, and he was evacuated by sea, arriving on the East Coast on July 5, 1944.

After several days in a general hospital, he was transferred by air to another general hospital, arriving on July 9 1944. The initial physical examination at that institution revealed fever, yellowish-brown discoloration of the skin, apical systolic murmur, markedly enlarged spleen, and the edge of the liver four fingerbreadths below the costal margin and several small inguinal nodes. Several days after arrival he again developed cough, greater elevation of fever, anterior chest pain, nausea, and vomiting after meals. Pneumococcus type III was demonstrated in his sputum, and the x ray revealed evidence of pneumonia involving the basal portion of the right upper lobe. He was given 1,320,000 units of penicillin over a period of eight and one half days, and the process cleared Following this he reverted to his previous pattern of fever, weakness malaise, and variable appetite. He remained at that institution until September 9 1944 and during this period his fever ranged daily from 98 to about 101 F with the peak usually occurring at 4 00 P.M.

Again numerous laboratory procedures were accomplished The red blood cells averaged about 3,700 000 with hemoglobin of 13 Gm White blood cells ranged from 2 050 to 5 600 but on the average, were about 3 000 Differential counts noted polymorphonuclear leukocytes from 46 to 70 per cent and lymphocytes from 22 to 54 per cent No ab-

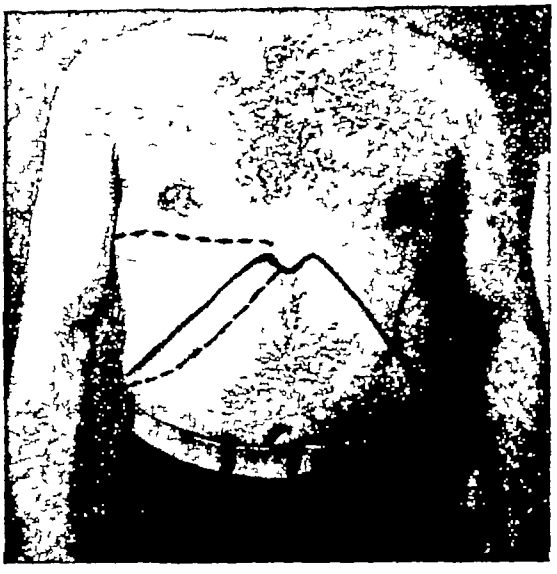

FIG 3

normal cells were noted in the peripheral blood Platelets numbered 64,000 and 95,000 on two occasions The erythrocyte sedimentation rate was persistently elevated at about 40 mm per hour Reticulocyte count, urinalysis, serology, repeated blood cultures, smears for malaria, stool examination for ova and parasites, and sputum tests for tuberculosis were all negative Agglutinations for typhoid, paratyphoid, Staphylococcus Schottmüller, undulant fever, and Weil-Felix were negative Three blood protein studies were normal. The formol-gel test was positive The electrocardiogram was normal except for sinus tachycardia, rate 120 per minute. Sternal puncture was performed with no evidence of leukemia A flat plate of the abdomen revealed a moderately enlarged liver and markedly enlarged spleen

The patient was presented before a medical conference at the general hospital, and the consensus of opinion was that leukemia was the probable diagnosis However, an observation was made by a medical officer that visceral leishmaniasis, or kala-azar, was a possible alternative diagnosis Subsequently, blood smears were searched for Leishmania donovani, but none were found Also, the temperature was recorded every two hours to observe any tendency toward a double or triple rise during the day, but this, too, could not be established On August 18, 1944, partial resection of the left sixth rib was performed for biopsy studies and submitted to the Army Medical Museum However, the specimen was later reported as being inadequate for definite pathologic diagnosis Up to this point, his treatment had been supportive in nature and consisted of transfusions, liver extract, vitamins, and iron While at the general hospital, he sustained some further loss in weight and strength

Finally, to enable the patient to be near his family, he was transferred to Borden General Hospital and arrived there on September 10, 1944

Physical Examination—The patient appeared chronically ill There was a dusky, brown pigmentation over his body, especially accentuated over the forehead and temples His tonsils were somewhat enlarged, cryptic, and reddened No petechiae or pigmentation of mucous membrane were noted Slight cervical adenopathy was present The heart was not enlarged, the rate being 84, he had a regular sinus rhythm and a faint systolic murmur was audible over the precordium The aortic second sound was equal to the pulmonic second sound, he had sounds of good muscular quality His diaphragm was percussed high bilaterally, due to a markedly enlarged liver and spleen causing a shallow thoracic cage No other abnormal findings were noted The abdomen was protuberant, particularly in the upper half No varices, nevi, or ascites were noted The liver and spleen were both markedly enlarged The spleen was percussed 6 inches above the costal margin in the left midaxillary line, pushing the diaphragm upward It further extended downward, filling the left upper quadrant and left midquadrant, descending further into the left lower quadrant some 3 inches below the costal margin in the left midaxillary line It extended medially to just beyond the midline of the abdomen. The surface of the spleen was smooth, nontender, and moderately firm The upper border of liver dullness percussed 4 inches above the costal margin in the right midclavicular line and the liver could be palpated 4 inches below the costal margin in this same line In the right midaxillary line, the liver percussed $7\frac{1}{2}$ inches above the costal margin and could be palpated some $2\frac{1}{2}$ inches below the costal margin in the same line The surface of the liver was smooth, nontender, and somewhat soft (Fig 1) There was a mild muscular atrophy and generalized weakness

Laboratory Studies—Again, complete blood counts were repeated. Red blood cells averaged 3,700,000, with 10 Gm of hemoglobin Marked leukopenia was present, with white cells ranging from 1,750 to 2,200 Polymorphonuclear leukocytes averaged 60 per cent and lymphocytes 40 per cent Platelets ranged from 70,000 to 100,000 Erythrocyte sedimentation rate varied from 84 to 120 mm per hour Prothrombin, clotting time, clot retraction, fragility test, serology, urine, blood sugar, cholesterol, calcium, icteric index, and the usual agglutinations were normal Blood smears for malaria and L. donovani failed to demonstrate any parasites Blood protein study revealed a total of 8 6 Gm—albumin 3 2 Gm, and globulin 5 4 Gm A second study revealed total of 9 1 Gm—albumin 3 3 Gm, and globulin 5 8 Gm X-rays of the abdomen demonstrated a markedly enlarged spleen and liver X-rays of the chest showed a markedly elevated diaphragm with increased lung markings. Electrocardiogram revealed low voltage, otherwise it was normal

Course—His temperature on admission was 99 5 F, pulse 84, respirations 20 During his first one and one-half month's period of observation at Borden General Hospital, his temperature ranged from 99 to 100 F, with pulse in proportion. Check

of temperature every two hours from 8:00 A M to 10:00 P.M failed to show any tendency toward a double or triple rise. The patient sustained several nosebleeds while in the hospital Multiple serologic tests for leishmaniasis were performed and all were reported strongly positive. These tests included Sias, Rays, Brahmachari's, and the aldehyde test.

The clinical picture, the marked leukopenia the lesser depression of the red blood cells, the fair condition of the patient despite prolonged illness, the high blood protein, and the markedly positive multiple serologic tests for leishmaniasis together with the inability to establish any other diagnosis, made leishmaniasis a strong likelihood Therefore, on alternate days sternal, liver, and splenic punctures were performed and smears made, using Wright's stain. The sternal punctures showed no evidence of leukemia or leishmaniasis. However, typical Leishman Donovan bodies were demonstrated in the liver and splenic specimens (Fig. 2)

On October 28 1944, intravenous treatment with neostibosan, a pentavalent antimony preparation, was commenced and continued every other day for fifteen doses, the initial dose being 0 2 Gm., and subsequent doses 0 3 Gm., as outlined by Army directives.

The response was fairly prompt. The temperature dropped to normal on the fifth day after therapy was started and remained at normal levels thereafter Strength and weight increased progressively Blood counts were taken at frequent intervals and, starting November 10, the white and red cell counts steadily rose to reach normal range in early December

In the third week following institution of neostibosan therapy, clinical evidence of reduction in the size of the spleen was noted and this progressed so that by late February, 1945, the spleen and liver were at the costal margin (Fig 3) No toxic effects were noted during the administration of the drug. At the time of writing this report the only abnormalities noted were blood protein increase (total protein 9 1 Gm.—albumin 4.4 Gm , and globulin 4.7 Gm) and serologic tests that were still positive for leishmaniasis.

ACUTE FULMINATING ULCERATIVE COLITIS

Treatment with Streptomycin

BENJAMIN KIRSCHNER, M D , New York City

THE following case is reported because (1) It is believed to be one of the first instances in which streptomycin has been used in civilian practice, (2) The response to the drug was so spectacular, after complete failure of all other therapeutic measures that further investigation appears to be indicated to fully evaluate its efficacy in this obstinate condition

Case Report

The patient, F B a white, unmarried woman, aged 22, was first seen on August 20 1945, at which time she presented the following history Two weeks previously while employed as a newspaper reporter in Buffalo, she and two other employees became ill with diarrhea. These three had not knowingly been in contact or in one another's company In the case under discussion the stools were characterized by blood mucus, foul odor very little fecal matter, and were as frequent as 10 to 12 daily There was no fever nausea vomiting or cramps. There was no history of recent respiratory infection or dietary indiscretion or of any previous like or relevant attack. There had been some mental anxiety due to home environment. The patient had received treatment with sulfa drugs and paregoric from a physician in Buffalo Despite treatment the condition persisted and became worse and after two weeks she returned to New York City In this period there was a loss of 20 pounds body weight. To her knowledge one of the other patients recovered in a week, but there was no knowledge of the third. Upon her arrival in New York City the frequency of the movements had increased to 15 to 20 daily

Physical examination revealed a patient apparently comfortable in bed The temperature was 98.8 F by rectum, the pulse 80, blood pressure 120/80 the conjunctivae were pale, and the tongue was dry and coated. There was no evidence of emaciation or dehydration The throat was clear and the chest negative The abdomen was soft, not distended, there were no areas of tenderness, no masses were palpable and the liver spleen, and kidneys were not palpable. The rectal examination was negative except for the discharge of a reddish-brown fluid after the examination. No vaginal examination was made. A diagnosis of probable ulcerative colitis was entertained and the patient hospitalized

At the hospital, stool specimens were collected and sent to the Department of Health Laboratories, the Tropical Disease Laboratory, and to the Diagnostic Laboratory of the Beth Israel Hospital. The reports revealed the macroscopic presence of blood and mucus and microscopically red blood cells and leukocytes. There was no evidence of pathogenic parasites. The culture of the stool displayed B coli. Examination of the blood for agglutinable diseases by the Department of Health on August 21, 1945 was positive for typhoid 1 80, on August 27, 1945 it was positive, 1 20 These were not considered significant of typhoid fever

The blood culture was negative The blood count showed hemoglobin, 80 per cent, red blood count of 4,010 000, white blood cells, 15 000, differential—polymorphonuclears 79 per cent 58 per cent mature, 21 per cent band forms 2 per cent monocytes, 19 per cent lymphocytes Sedimentation rate was one hour and forty five minutes, the urine was turbid dark amber, acid, specific gravity 1 026, 1 plus albumin, sugar negative, micro-

opically there were a few epithelial cells and 2 to white blood cells per high power field.

The patient was immediately placed on treatent with 20,000 units of penicillin injected intrauscularly every three hours combined with an itial dose of 2 Gm of sulfasuxidine, and subseent doses of 1 Gm every four hours In adtion she was placed on a nonresidue diet, given icture of opium according as circumstances reured, and multiple vitamins and amino acids by jection This treatment was maintained for five ys without improvement in the symptoms The tient had eight to ten movements daily as deribed, but soon developed some nausea and low dominal pain On the fifth day after admission, ter a bowel movement which contained a large nount of blood and blood clots, the patient ddenly went into shock. The pulse increased to 0, the extremities became cold and clammy, d the blood pressure dropped to 80/60 The lfa and penicillin were discontinued and the tient was treated for shock The hemoglobin this time was 84 per cent, which was believed e to some dehydration

The patient recovered from the acute shock but e general course continued unsatisfactory The wel movements continued as before and it beme necessary to replace the blood loss by transsions These were given every other day On e tenth day of admission the patient was seen by consultant and sigmoidoscopy was performed, th the following findings "The mucosa of the ctum presents an edematous hyperemic appearce with superficial erosions and active hemorage It is the typical picture of chronic ulcerative litis due to bacillary dysentery" In addition, me of the bowel contents were aspirated and a dside microscopic examination made This was gative except for red blood cells A culture of e material also failed to reveal any pathogenic ganisms An additional therapeutic measure was gun in the form of the administration of oxygen ctally, ten minutes three times daily at the rate 40 bubbles per minute

Despite these measures the patient failed to spond, and now began a "septic" type of temrature, spiking from 100 F in the morning to 3 F in the afternoon Blood culture was again gative, and penicillin therapy was reinstituted in dition to the transfusions, which were now being ternated with plasma and glucose as was seen fit nce the pulse was weaker it was also necessary to sort to cardiac stimulation

On the seventeenth day of admission the bowel as re-examined by the same observer, who found idence of epithelialization and was of the opinion at the condition was in the healing phase Deite this visual improvement the clinical condion was poor The patient began to develop the pical appearance of emaciation and dehydration dicative of slow disintegration

On the twenty-fifth day of admission, the patient id a sudden severe hemorrhage with the passage large amounts of fresh blood and blood clots from e bowel. With this, she again went into peipheral circulatory collapse The temperature rose 104 F, pulse to 160, and the condition became itical Transfusions of 200 cc of whole blood ere administered every four hours, it now being cessary to cut down to obtain suitable veins alcium gluconate with vitamin K was administred intravenously, and also hemoplastic serum espite these measures subsequent discharges from e bowel still contained blood, old and new At this time, the patient was examined by another consultant, who considered the condition very grave and advised the use of streptomycin Steps were instituted to obtain the drug from the Armed Forces It was not obtained until forty-eight hours later Meanwhile emetin and diodoquin were administered empirically

By the time streptomycin could be administered, the patient had become moribund The pulse was unobtainable, the rate 180 with weak cardiac sounds Respirations were shallow and irregular with the use of oxygen by inhalation, the extremities were cold and clammy and it was necessary to administer stimulation at frequent intervals A transfusion of whole blood, 1,000 cc, was given and permitted to run in in two and a half hours This was followed by 2,000 cc of glucose at a slower rate On the twenty-seventh day after admission the first dose of streptomycin was administered. Five hundred thousand units of the hydrochloride were given intramuscularly and this dose was repeated at four-hour intervals After the administration of the third dose the patient showed signs of recovering from the circulatory collapse The pulse became perceptible, irregular at first and at a rate of 160 The respirations became less shallow and the extremities recovered some warmth The blood pressure became obtainable at 60/0 After this third dose, the patient had a bowel movement and for the first time since her illness, this was free from blood During the next twenty-four-hour period the patient had but four movements, all free of blood, and the following two days two to three movements free of blood The character of the stool improved in that it was less watery and more fecal matter could be detected.

Following the administration of the streptomycin the improvement continued The temperature subsided by lysis, the rate and quality of the pulse improved, and the blood pressure increased to 100/60 The patient began to look brighter and feel better She expressed desire for food, and was able to retain it with no nausea or vomiting The tongue lost its coating and dryness It was now necessary to resort to little stimulation and the oxygen was discontinued This improvement was steady and was maintained for four days, all of which time the streptomycin was continued at the same rate and dosage Also, the continuous infusions in the leg vein were administered, whole blood being alternated with plasma and glucose at a slow rate On the thirty-first day of illness this leg vein became thrombosed and the infusions were discontinued About two hours after the infusions were stopped the patient suddenly took a deep gasp of breath and expired within ten minutes, apparently as the result of pulmonary embolism originating in the femoral veins

Summary

1 A case of acute ulcerative colitis is presented which reacted to streptomycin after all other remedies had failed

2 Further investigation of this drug in ulcerative colitis is warranted

3 The site of the embolism undoubtedly was the vein in the leg which had been used for the transfusions

The author wishes to express his thanks to Dr Burrill B Crohn, Dr Joseph Felsen, and Dr Sam Weiskopf for their aid and advice, and to Dr Herman Frosch for his aid with the transfusions.

955 Walton Avenue

CONFERENCES ON THERAPY

DEPARTMENTS OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESE are stenographic reports slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors The next report will appear in the May 1 issue and will concern "Treatment of Meningitis"

Oral Penicillin

DR DAVID BARR We have for discussion today the subject of the oral use of penicillin. As you know, Dr Bunn, Dr McDermott, and others in this hospital have been active in exploring the possibilities of administering penicillin by mouth The discussion will be started by Dr Bunn

DR. PAUL A. BUNN Studies of the pharmacology of orally administered penicillin quite early showed that absorption is considerably less following the oral administration than after the parenteral administration. The following comments are being made on the basis of experience both with the pharmacologic action and the clinical observations made at the New York Hospital in the past eighteen months

In all of the experiments on the fate of the orally administered penicillin there has been a striking uniformity of results. To obtain penicillin blood levels of similar height and duration, it is necessary to use approximately five times as much penicillin by mouth as by parenteral injection. No vehicle has yet been found which appreciably alters this ratio In this laboratory a great variety of vehicles and methods of administration have been tried, but with none were the blood concentrations significantly greater than when the penicillin was given in tap water or enclosed in a simple, quickly dissolving gelatin capsule Experiments were carried out on humans and animals in an attempt to discover the reasons for the difference in dosage required for the same blood levels. It was found that little, if any, penicillin is destroyed in the body following parenteral administration This is proved by the fact that between 70 and 100 per cent of the penicillin given parenterally is excreted in the urine in a period of six to eight hours. However, when penicillin is taken by mouth, a maximum of only 36 per cent is detected in the urine As a matter of fact, the average total excretion is considerably less than one third, and is in the neighborhood of 15 to 20 per cent.

This discrepancy in urinary excretion from the two routes of administration must be explained by factors interfering with the absorption It was originally believed that there was excessive destruction of penicillin by the free hydrochloric acid in the stomach when the material was given orally To ascertain how rapidly this destruction might occur, in vitro experiments were set up in which penicillin was incubated with gastric contents at varying levels of pH. At a pH of 4 penicillin is destroyed slowly At a pH of 3 5 the destruction is slightly more rapid, while at a pH below 3 the destruction is quite rapid, usually within two hours. The gastric content in humans, of course, is subject to wide fluctuations, but it is quite frequently at a pH of 4 or above. Following this observation a series of patients with pernicious anemia were given penicillin In no instance in this group of patients was more than 36 per cent of the ingested dose recovered in the urine in periods up to twelve hours Attempts at neutralizing the gastric contents with aluminum hydroxide gel and magnesium trisilicate before the administration of penicillin also failed to increase the amount of absorption as shown by urinary excretion studies. Therefore, as human gastric acidity, although varying, is frequently above the pH at which penicillin is rapidly destroyed by acid, as persons with achlorhydria do not absorb significantly more penicillin than do individuals with normal gastric secretory mechanisms, and as neutralizing the gastric contents immediately before the administration of penicillin does not increase the amount absorbed, acid destruction does not solely explain the relatively poor absorption of penicillin from the gastrointestinal tract.

The differences cannot be a matter of destruction by the liver, since, as already stated, the parenteral dose is virtually all recovered in the urine, and following an injection of penicillin directly into the portal vein of an animal, the resulting peripheral blood concentrations are not unlike those seen following any peripheral intravenous injection As only one tenth to a third of the total amount given is absorbed, most of the remaining penicillin must be destroyed in the gas-

trointestinal tract below the stomach or excreted in the stool When penicillin is incubated with emulsions of stool, complete destruction of the material occurs, within twenty-four hours Last, following a large oral dose, penicillin can be found in the stool Through those mechanisms, then, a large proportion of the ingested material which is not absorbed is lost to the body, that is, through excretion in the stool or destruction probably in the large bowel

The oral-intramuscular dosage ratio of approximately 5 to 1 is based on studies of renal excretion and on serial determinations of blood concentrations following the oral administration of various amounts of penicillin Provided enough is used, based upon this 5 to 1 ratio, the oral route of administration of penicillin results in regular and predictable blood levels, and is an effective way to treat infections

A series of infections have been treated at the New York Hospital and on the Second Division at Bellevue In the original dose regimens considerably more penicillin was supplied than the 5 to 1 ratio, but as experience was gained, more favorable schedules for most of the infections have been worked out The infections treated include those caused by the pneumococcus, gonococcus, staphylococcus, beta-hemolytic streptococcus, and also Vincent's infection of the mouth and gums

The most thoroughly studied infections in this group were those caused by the pneumococcus Pneumococcus pneumonia furnishes an ideal infection for chemotherapeutic study, as the patients require hospitalization, the organism is sensitive to penicillin, and the parenteral dosage regimens, which have been carefully worked out, furnish a satisfactory standard for comparison In the winter of 1944–1945, 50 patients with pneumococcal lobar pneumonia were treated with penicillin by mouth The original dose regimens used in these patients varied considerably Those in the last half of the series received the drug according to a fairly uniform plan In order to establish a high effective blood level to combat the possible bacteremia, 200,000 units of penicillin were given initially This was followed by 50,000 units every two hours for twelve daily doses, 50,000 units every two hours a day and night Twenty-four to thirty-six hours after a satisfactory crisis, the night doses were omitted, and the 50,000 units were given from 8 00 A M to 10 00 P M , inclusive The duration of treatment varied from four to seven days in most cases In about half of the cases, the penicillin was administered dissolved in water or given in the quick-dissolving gelatin capsule In most of the remainder, a capsule containing cottonseed or corn oil was used All of the patients were acutely ill and many were critically so when treatment was instituted The results of treatment were quite satisfactory, a crisis developing within forty-eight hours in 80 per cent of the cases In the others the fever came down slowly by lysis over a period of ninety-six hours No difference in the therapeutic response could be demonstrated between the group of patients receiving the oil suspension and those who received penicillin dissolved in water In this particular series there was one death That occurred in a man 50 years old, a chronic alcoholic, who died within six hours after the institution of therapy It is probable that no matter how the penicillin had been administered he would have died, because he developed peripheral vascular collapse before the antibacterial agent could exert an effect There was but one serious complication, a case of empyema This occurred on the seventh day of illness, four days after treatment was instituted The empyema was treated by one intrapleural injection of penicillin Complete recovery from both the pneumonia and the empyema eventually occurred

Of particular interest in this series of patients with pneumonia was the phenomenon of febrile relapses In general these were of two types The first occurred in patients twenty-four to thirty-six hours after the crisis, the fever rising to about 102 5 F in some cases This did not alter the therapy regimen The second type, of much more interest, occurred in five patients on the seventh to the tenth day after the disease had begun, usually two to four days after therapy had been discontinued The fever, up to 103 F , was frequently associated with a return of the symptoms and sputum, but never with clinical or roentgenographic evidence of a spread of the disease With the reinstitution of therapy, the fever promptly subsided, and in two patients it subsided within forty-eight hours without treatment

Food interferes with the absorption of orally administered penicillin However, this does not interfere with the initial therapy of persons acutely ill with pneumonia, as virtually all are in a fasting state at the beginning of therapy

In summary, a series of 50 patients with pneumococcal pneumonia were treated by the oral administration of penicillin The dosage regimen for most of the patients was 750,000 units the first day, and 400,000 to 600,000 units on subsequent days of therapy The therapeutic results in this series were comparable to those observed in the penicillin treatment of pneumococcus pneumonia by the parenteral route The average total amount of penicillin used in these cases was five times that generally employed for the treatment of pneumonia by the intramuscular route

The second group of infections treated were

the gonococcal Acute gonococcal infections in both the male and female can be successfully treated by the use of penicillin given by mouth In a small series, 14 men and 6 women, all with bacteriologically proved gonorrhea, were treated with orally administered penicillin Once again the dosage regimens during the first part of the series varied About half of the patients received this regimen 100,000 units initially, followed by 50,000 units every three hours for a total of five or six doses, making a total of 300,000 to 400,000 units. There were nineteen clinical and bacteriologic cures in the group of 20 patients There was one failure in a patient who received penicillin in a suspension of oil and beeswax This patient received only 300,000 units Since a much larger series of patients with gonorrhea would have to be treated in order to discover the most favorable dosage regimen and since the cases of acute gonorrhea seen in this hospital are so few no attempt was made to pursue this matter further A much more effective regimen, and one we would recommend, would consist of 100,000 units every three hours for five or six doses The matter of dosage is obviously in need of further study

A third group of patients treated had staphylococcic infections. Penicillin is the most effective chemotherapeutic agent against the staphylococcus. However, larger amounts of the material are required for the proper treatment of staphylococcal infections than are necessary for infections caused by the gonococcus and pneumococcus Even by the parenteral route it is customary to use at least 300,000 units daily for ten to twenty-eight days to control and cure the disease As it requires at least five times as much penicillin when given by mouth to manage such a case, the oral dose becomes 1,200,000 to 1,500,000 units daily This, of course, would be satisfactory treatment, but the cost of penicillin at present is still such that it would not be very practicable.

The efficacy of the oral penicillin was tested in fifteen proved Staphylococcus aureus infections. These include 5 patients with localized draining abscesses on the head or neck, 3 with carbuncles, 3 cases of acute purulent otitis media, and 2 cases of acute tracheobronchitis Two of these cases are quite informative. The first one was in a 9-week-old child who suffered from a severe Staph aureus tracheobronchitis which had not responded to adequate doses of sulfonamides Penicillin, 20,000 units, in tap water, was given by dropper into the pharynx every three hours for four days Although the child was desperately ill, he made a rapid and uneventful recovery There is not much question that the penicillin used in this case shortened the course of the disease, may have prevented complications of a metastatic nature, and probably saved the child's life A second informative case was in a male patient, aged 30 years, who had had sycosis barbi for years In 1944 he developed a severe staphylococcic septicemia and endocarditis with the primary origin of the infection undoubtedly from his face. Large doses of parenterally administered penicillin produced a dramatic cure, and he was well for the next year In the spring of 1945 he again developed a recurrence of his sycosis At the time he visited the outpatient department he was found to have multiple small and coalescing facial abscesses on both sides, and the infection was obviously spreading The oral administration of but 600,000 units of penicillin in water controlled the infection within twenty-four hours, and apparently completely wiped it out in a period of four days The total dose was 2 500 000 units The seriousness of a recurrence of sycosis in this patient, of course, was not overlooked Had this patient had fever he would have undoubtedly come into the hospital for parenteral penicillin As it was, because of the economic problem involved, he was permitted for the first twenty four hours to try penicillin Because this was so successful, the treatment was continued by the oral route

Again it must be emphasized that, because of the relative resistance of the staphylococcus to penicillin, the usual severity of staphylococcic infections, and the large amounts of drug that under ordinary circumstances would be needed, it is not yet practical to treat staphylococcic infections by the oral route.

As for the streptococcus, streptococcic pharyngitis and septic sore throat have been successfully treated by orally administered penicillin In 17 cases so treated, clinical improvement was demonstrated by a drop in temperature and leukocyte count, and a diminution of the local inflammation within a few hours Large total amounts of penicillin were needed, 50,000 units eight to twelve times daily for seven days being the minimal regimen

We have ,treated other cases of streptococcic infections, including cervical lymphadenitis, purulent maxillary sinusitis, and cellulitis of the foot and lower leg In each of these cases, as in the staphylococcic infections, surgical drainage when necessary was instituted early during the course of penicillin therapy In these latter mentioned streptococcic infections larger amounts of penicillin were necessary, even up to 100,000 units every two hours for periods longer than one week.

The last group of infections treated with orally-administered penicillin is Vincent's infection of the mouth and gums. The administration of 25,000 to 50,000 units of penicillin, in tap

water, given eight to ten times daily for four to seven days, controlled this clinically obvious infection in a small group of 10 patients Occasionally, simultaneous local application of a penicillin solution containing 100,000 units in 30 cc of water or saline may be used, and apparently this speeds up the recovery

Dr Walsh McDermott Whenever we are presented with an antibacterial agent, it is a relatively simple matter to find out whether the agent has an effect upon infections It is a vastly different matter, however, to find out how much or over how long a period the agent should be administered to achieve proper therapy In the case of penicillin we havea ccumulated a vast body of information on these points Usually, when a new drug is introduced into medicine it is tried by all available routes at the time of its introduction It is unique to have a drug tried out by a new route after a large background of clinical information on the effects of the drug has already been established

The infections for which penicillin therapy is of value have been thoroughly studied and the height and duration of the blood penicillin concentrations which are desirable for the treatment of infections have been tentatively established Therefore, once it had been demonstrated that appreciable quantities of penicillin were absorbed following ingestion, the problem of oral administration was essentially a question of establishing regimens by which the proper blood penicillin concentration scould be maintained The problem was not, as is so frequently represented, a question of whether a particular infectious disease could or could not be cured by "oral penicillin "

As Dr Bunn has stated, from our investigations of the mechanics of the administration of penicillin by mouth it appears that in order to produce a given concentration of penicillin in the blood, one must administer approximately five times as much penicillin by the oral as by the intramuscular route Therefore, from a practical standpoint, the use of the oral route for penicillin therapy is limited to those infections which are most sensitive to the action of penicillin These include pneumococcus pneumonia, beta-hemolytic streptococcus infections of the pharnyx, fusospirochetal infections of gums and mucous membranes, gonorrhea, and certain instances of pyoderma caused by staphylococci Orally administered penicillin should not be used in the treatment of serious staphylococcal infections, any form of bacterial endocarditis, or syphilis, unless the physician is prepared to give one or two million units daily Even with these large doses it should be appreciated that, in terms of the penicillin concentrations which are attained in the blood, the patient would be receiving only the minimal proper therapy for these three serious types of infection Infectious, i e , early, syphilis should not be treated with penicillin by mouth unless the patient is hospitalized and the administration of each dose is supervised This is essential because the evaluation of the adequacy of a particular treatment for syphilis must be based almost entirely on how much treatment the patient received during a certain period of time The clinical course of the infection during, and for many months after treatment, is no index at all as to whether the particular treatment was successful Therefore, if there is doubt as to precisely how much penicillin the patient actually received, as might be the case in ambulatory patients treated orally, the physician would have no real basis for a decision as to whether or not the syphilis had been adequately treated If it should be established that it is necessary to treat certain infections such as neurosyphilis or osteomyelitis for four- to six-week periods, it is conceivable that during the latter part of the course of treatment the penicillin could be administered by mouth

The feature about the oral administration of penicillin which causes us considerable alarm is that there is a tendency to use inadequate amounts of penicillin

In an effort to establish that a particular oral preparation has advantages over other preparations, claims are made that it is necessary to give only twice to three times the usual intramuscular dose As the greatest amount of absorption which we have noted after the administration of any preparation represents only one third of the total dose, and is usually only about one fifth, it is our opinion that unless the oral-intramuscular dose ratio of 5 to 1 is used, there is a considerable danger of underdosage

Dr Barr Will you discuss this presentation of Dr Bunn? Are there any questions?

Dr Harry Gold I would like to ask Dr Bunn how much loss would result in penicillin solutions incubated with gastric juice over a period of half an hour?

Dr Bunn It would vary with the pH

Dr Gold Take, as an example, a pH of about 2

Dr Bunn At a pH of 2, a considerable amount of destruction would take place in half an hour

Dr Gold Would you say 25 per cent?

Dr Bunn Probably more than that, and in one hour, practically all of it

Dr Gold I am interested in the point you made that destruction by acid is not very important, also the fact that you give the material on an empty stomach The penicillin would leave the empty stomach within a few minutes and, therefore, the exposure of penicillin to acid would not

be long enough to allow for much destruction That, I presume, is the reason for your deduction that gastric acidity is not an important factor I think everything fits.

DR MCKEEN CATTELL I have difficulty in accepting the notion that penicillin is not destroyed in the blood stream in appreciable amounts. Certainly its activity is gradually lost when incubated with blood serum at body temperature I have also in mind observations of others, notably the paper by Free and his associates which appeared in a recent number of *Science*, in which recoveries of penicillin in the urine were not nearly as great as those reported here—about 60 per cent, on the average The point I want to make is that if there is any destruction of intravenously administered penicillin, no matter how small, one would expect that when given by mouth a larger fraction would be destroyed after absorption There are two reasons for this the excretion rate of any substance is related to the concentration in the blood, and second, slow entrance into the blood stream gives more time for destruction Both of these factors favor a greater destruction of oral penicillin.

DR. BUNN I realize that others have obtained lower recoveries than we have. It is hard to know just what that means. There is the fact that one has to depend upon a method of assay which has a considerable margin of error The fact remains that, using this method of assay, recoveries of 80 to 100 per cent can be obtained following the intravenous doses and at least 70 per cent following the intramuscular doses This is in line with the fact that no one has ever been able to demonstrate actual destruction of penicillin by tissue over short periods of time.

DR. CATTELL I am inclined to consider the fact that the failure to recover all indicates that some is destroyed in the body

DR CHARLES L. WHITTEMORE Is there any vehicle for masking the disagreeable taste of the penicillin? Private patients do not like it

DR BUNN Yes There are several ways of either eliminating the factor of taste or masking it. The quickly dissolving gelatin capsule of penicillin, of course, eliminates the taste, also the suspension of penicillin in oil covered with beeswax. In the Squibb tablet of penicillin with trisodium citrate, the taste of penicillin is still perceived However, in our experience, the patients have not objected very much to drinking the solution of penicillin in tap water We have never had a patient refuse a dose because of the taste

DR WHITTEMORE It has been mentioned from time to time that it is not wise to give penicillin unless it is very definitely needed, because of the danger of sensitizing the patient to its future use. How do you feel about it?

DR MCDERMOTT I think that one should not use penicillin unless the indications are definite It is apparently a fact that sensitization occurs The subject of sensitization to penicillin is not understood as well as it is about some other drugs

The assumption has been made that substances other than the antibacterial agent cause the sensitization phenomenon This assumption rests on extremely weak ground There is some evidence that the crystalline fractions of penicillin may also give rise to sensitization phenomena. Thus far, the cases of sensitization which we have observed have not been so severe that we have had to discontinue penicillin. However, the reactions can be sufficiently annoying to incapacitate a patient for a week. But I see no reason to withhold the drug in the face of a specific indication because at some possible theoretic future time one might need to use it again

DR CATTELL Have reactions been observed following the oral administration of penicillin?

DR MCDERMOTT No, but we have only treated perhaps 200 individuals who have taken one or more doses by mouth. One patient developed urticaria, but there was here the possibility that it was present before the penicillin was given I see no reason to believe that sensitization reactions will not occur

DR. WALTER MODELL I take it that the 5 to 1 ratio is required not because penicillin is destroyed in the stomach, but because it passes beyond the region from which absorption takes place Therefore, vehicles are not likely to improve that.

DR. MCDERMOTT Precisely It would appear to us that the only means of improving penicillin absorption by the oral route would be by some vehicle which caused it to remain in the small intestine and be slowly released over a long period of time.

DR GOLD Is it quite proper to apply the term "poor absorption" to a substance like penicillin, when an oral dose finds its way into the blood stream within twenty minutes or so? That molecule must be passing through the intestinal barrier pretty fast.

DR. MCDERMOTT Incomplete absorption is perhaps a better term for it.

STUDENT Is it true that Bacillus coli organisms inactivate penicillin?

DR. BUNN Yes

SAME STUDENT Would that help to explain the phenomenon that so much larger doses are necessary by oral administration?

DR BUNN I don't think that there is any question but that the destruction of the penicillin occurs in the large gut, probably because of bac-

terial action Absorption is minimal from the large bowel

SAME STUDENT What about the small bowel?

DR BUNN Absorption is greatest in the duodenum, less in the jejunum and ileum, and minimal in the large bowel and cecum Theoretically, the small bowel does not contain organisms which destroy penicillin, and so the poor absorption of the penicillin cannot be explained on that basis

It is true that there is destruction in the large bowel, probably due to bacterial action, and this probably explains the poor absorption from this region But we do not know why absorption is not more complete from the small intestine

DR GOLD Does penicillin cause diarrhea?

DR BUNN It does not cause diarrhea Occasionally it will produce one or two loose bowel movements a day, but not diarrhea

DR GOLD There is, then, some increase in intestinal motility which may cause the material to move more quickly down the intestinal tract and into the lower bowel

DR BUNN That has been our idea, but we have no way of proving the assumption

DR MCDERMOTT I might mention that when we used vehicles such as beeswax to slow down the release of penicillin, three types of effects were observed either there was no absorption, or absorption was unchanged or greatly enhanced Our notion is that the bolus of material is sometimes carried along past the absorbtion site, if you could call it that, and then no longer can be absorbed

DR BUNN We have had experience with one vehicle which was supposed to slow down absorption It slowed it down so much that we found the capsules intact in the stool specimen the next day

DR BARR How often do you encounter vomiting with the mouth dosage?

DR BUNN We had just one such experience, Dr Barr, and that was in the case of an intern who took a huge dose dissolved in a small amount of water

DR MCDERMOTT How large was the dose?

DR BUNN It was 5,000,000 units dissolved in 30 cc of water

DR BARR That includes an experience with very sick patients, too?

DR BUNN Yes sir, that does

DR BARR Have you had experience with oral penicillin in surgical patients? The reason I ask is because I have heard surgeons say oral penicillin caused vomiting, which would be most undesirable in many of the conditions with which they deal

DR BUNN We have not used penicillin in surgical patients However, I have never seen vomiting with ordinary dosages used in extremely ill medical patients

DR. BARR I should like also to ask about the cost of penicillin In a hospital of 1,000 beds the present cost of penicillin may amount to $5,000 a month Are there ways and means by which the cost of penicillin could be reduced without sacrificing any of its benefits? Is a considerable part of the cost involved in packaging?

DR BUNN Mr Clarke is here He may be able to answer that question

MR DONALD A CLARKE I think that there is a possibility that one of the reasons for the continued high cost is the failure to find a use for the by-products in the manufacture of penicillin Most of the manufacturers agree that if they could find a use for the by-products the cost would be reduced quite materially Is that right, Dr McDermott?

DR MCDERMOTT I had not realized that, Mr Clarke I thought that the actual cost of production is not very high, not much more than that of the vacuum-sealed ampule and packaging One reason for the high cost here in this hospital—and I am sure you will agree with me—is that it is fashionable to use it for all sorts of things, and it is being overused at this time The intramuscular route of administration acts as somewhat of a brake on that, but even so, it is being overused

DR GOLD At the present time you are using parenteral material by mouth, aren't you?

DR MCDERMOTT Yes, we are

DR GOLD Parenteral material is generally much more costly than oral As the oral route becomes more widely used, special, less costly material may become available for that purpose Oral material should not require all the sterility precautions

DR CATTELL It might be put up in bulk

DR MCDERMOTT Stability is the problem there

DR CATTELL If you use a large amount in a month, that might not be a problem

DR GOLD A vacuum-sealed sterile ampule with a rubber cap would seem to be a relatively costly way of putting up an oral drug

MR CLARKE The oral forms now available are more expensive, unit for unit, than are the parenteral forms

DR BUNN I have looked into that One can buy 100,000 units of a parenteral preparation of penicillin for about 90 cents I received a card in the mail today quoting one capsule containing citrate, 20,000 units, at 35 cents That makes about $1 75 for 100,000 units, and this is one of the less expensive of the oral preparations Some proprietary preparations cost as much as $4 00 for 100,000 units When one realizes that it is necessary to use approximately five times as

much by the oral route, the cost becomes prohibitive to buy commercial preparations of the current oral material.

DR. CATTELL But actually, in treating a case of pneumonia with oral penicillin the cost would not be as great as treating it by the old serum method, would it?

DR BUNN No

DR BARR When, during infection, the fever subsides, the question constantly arises shall we now discontinue penicillin? Since penicillin is relatively harmless, the verdict is often let it be continued Certainly much of the present use of penicillin is in the afebrile period Are there any rules by which usage during this stage may be limited?

DR BUNN Complete control of the infection is the one indication that I know of to stop penicillin I think that in our experience with the pneumonia patients we learned a lesson I believe we were extremely lucky in the results we had In retrospect, and I think Dr McDermott will certainly agree with me, we stopped the penicillin too early Part of the reason why we are getting the febrile relapses at the end of two to four days after the cessation of therapy was the fact that they had not received enough penicillin throughout the course of their illness. There is always a tendency to stop treatment when there are no obvious indications to keep it going If we continue the use of oral penicillin in pneumonia, we would treat them for at least seven days after the drop in temperature.

DR BARR And with other infections would the rule be the same?

DR. BUNN Yes, I believe so

DR CATTELL It is not necessary in the case of the gonococcic infections, is it?

DR BUNN Gonococcal infections are hard to evaluate Relapses can occur up to twenty-one days following initial infection, and unless the cases are extremely well followed, we may miss one by following them for only a week as we did in our series.

DR CATTELL But your recommendation called for only one-day treatment, did it not?

DR. BUNN Yes, by that time there are bacteriologic cures, that is, the organisms are gone from the secretions Although the pus may not disappear, it is sterile. This is not true in infections such as pneumonia.

DR GOLD Could we have an opinion as to why some have regarded special vehicles as important for oral penicillin, and now you find they are not?

DR. MCDERMOTT You will recall that the Floreys found that penicillin given by mouth was absorbed, and was quite effective. But they had very little material to work with, and as they knew that a pH of 2 destroyed penicillin in extraction, they assumed that the reason that it was not absorbed as well as from a parenteral depot was perhaps the fact that hydrochloric acid destroyed it in the stomach The work which was resumed after three years began with that assumption We do not wish to imply that no destruction of penicillin takes place in the stomach, but, as Dr Gold pointed out, it is not in there very long and the amount of destruction which takes place is extremely variable, on the whole not enough to be of consequence.

DR MODELL I want to ask about the patient's preference In the small hours of the morning, which would the patient prefer, to be awakened every two hours to drink some cold water with penicillin or to swallow some capsules, or to just roll over, sometimes still asleep, to take an intramuscular injection?

DR BUNN I can only speak from experience, and I believe I would rather drink it.

DR. MCDERMOTT In the patients of the pneumonia series there were no night doses after the crisis. We do not know, however, that that is ideal chemotherapeutic practice.

DR. MODELL They certainly can take intramuscular injections almost without waking up

DR MCDERMOTT That is variable.

DR. BARR How small a dose, Dr McDermott, will abolish the symptoms of infectious syphilis?

DR MCDERMOTT As little as 1,000 units every three hours intramuscularly, or a total of 60 000 units given over a seven-and-one-half-day period, abolished all of the evidence of infection in a series of perhaps 40 or 50 patients. To be sure, the disappearance of the infection was followed by relapse in a large number of the patients

DR BARR I am informed that oral penicillin can now be purchased over the counter Is that correct?

DR MCDERMOTT Yes, that is true

DR MODELL There is a local city regulation prohibiting the over-the-counter sale of penicillin, but I presume the enforcement is not very effective There is also some Federal attempt at regulation

DR BARR It seems to me that those two statements illustrate the very great danger from oral usage of penicillin at the present time Anyone can enter a drugstore and get a considerable amount of penicillin, can take it by mouth with or without the advice of a physician, and, because his infectious symptoms seem to disappear, can discontinue its use and go on his way Is this an overstatement?

DR MCDERMOTT Absolutely not, sir It is very much to be feared

DR GOLD How about the development of tolerance, that is, resistance of the organisms to peni

cillin? Do you think that matter is of practical importance?

Dr McDermott We can just speculate on it, Dr Gold The present-day belief seems to be that resistant organisms are not created but are bred out, that is, they are not created by exposure to penicillin but were resistant to penicillin from the start Thus far it has not proved to be a problem in penicillin therapy It is interesting to note, in the case of sulfonamide therapy, that while the gonococcus has become somewhat resistant, the meningococcus, which is akin to it, has not

I am very much more afraid of this driving the infection underground in the individual than I am of the question of developing resistance

Dr Barr If there are no further questions, the meeting will adjourn

Summary

Dr Bunn The conference this afternoon was on the subject of the use of penicillin by oral administration The oral route was tried in some of the earliest observations on penicillin but was not pursued, apparently because of the fact that such high acidity as may occur in the stomach was known to destroy penicillin, and the initial experiments indicated that, in view of the very limited supply, the large doses required by this route would not be very practical The matter has now been re-examined, and the results indicate that the oral route is very satisfactory for the treatment of some infections with penicillin

An experience with more than 100 infections treated orally was related These infections included those caused by pneumococci, staphylococci, streptococci, gonococci, and Vincent's infection of the mouth and gums A satisfactory dosage plan for the treatment of pneumococcal pneumonia has been worked out There still seems much to be done in developing the most effective dosage plans for the treatment of the other infections

By the oral route it takes approximately five times as much penicillin as by intramuscular injection to achieve the same results, namely, height and duration of blood levels The dosage ratio of 5 to 1 does not appear to be altered by any of the current methods designed to protect penicillin against destruction in the gastrointestinal tract, such as beeswax, special capsules, and neutralization of the gastric juice The current experience indicates that ordinary penicillin dissolved in tap water and administered on an empty stomach is equally effective While it is a fact that penicillin is destroyed in the test tube by such acidity as may be found in the stomach, it appears that penicillin given on an empty stomach does not remain there long enough to undergo any substantial amount of destruction Penicillin penetrates the duodenal mucosa very quickly, since it may be detected in the blood stream within about twenty minutes However, it may be irritant to the gastrointestinal tract, and the suggestion has been offered that its rapid passage into the lower bowel, where absorption is poor and destruction by bacterial action is great may account for the fact that only about one fifth of a particular dose finds its way into the blood

The principles of parenteral penicillin therapy apply to the use of the drug by the oral route, except for the fact that it takes five times as much, on the average, with variations from three to ten times as much At the present time the oral route is most applicable to the infections with the more sensitive organisms and those in which experience with parenteral therapy indicates that the duration of treatment need not be very prolonged It is simply a matter of giving enough penicillin

Attention was called to the danger of the abuse of oral penicillin, the fact that it may be applied to too many cases with insufficient indication, thereby increasing the number of patients so sensitized that unpleasant reactions will result when more definite need arises for it in the future In the fact that penicillin is sometimes purchased in the drugstore without prescription lies the danger that patients may take to self-medication, which may result in the appearance of a cure while the disease continues to progress in a chronic form

---

MODERN EVOLUTION

One day two young friends of Charles Darwin decided to play a joke on the great scientist The boys took the wings of a butterfly, the legs of a grasshopper, the head of a beetle, and the body of a centipede, and very carefully glued these parts together

Then, placing the manufactured insect in a box, they called on Mr Darwin

"Mr Darwin," they said, "we caught this bug in a field Can you tell us what it is?"

The scientist examined the insect carefully and then asked, "Did it hum when you caught it?"

"Yes," replied the boys

"Then," said Darwin, with a twinkle in his eye, "it must be a humbug"—*J Am Inst Homeop, Dec, 1945*

THE GROUP PLAN OF MALPRACTICE INSURANCE AND DEFENSE

A Message from the Committee

To All Members

EVERY physician and surgeon in active practice must face the possibility that some day he may be called upon to sit before a jury of laymen and defend himself against a charge of malpractice The number of suits and claims filed each year against members of the Medical Society of the State of New York abundantly demonstrates that no practicing doctor is justified in complacent self-confidence or the belief that it will always be the other fellow who is sued No specialty or section of the state is free of this threat and, whether in private practice for himself, or serving as an employee or agent of another a doctor cannot escape personal liability for his own acts

Malpractice is the only form of liability which, in addition to threatening a doctor's pocketbook, attacks his professional standing in his community as well These are hard won and cherished possessions, the protection of which cannot be left to anything less than the most expert legal defense and soundest indemnity obtainable Both of these services are combined in the Group Plan of malpractice insurance and defense of the the State Society which for many years has provided the finest malpractice protection available to medical men in this or any other state Participation in the protection of the Group Plan is one of the important privileges of membership in the Society but members cannot profit by its benefits without accepting a certain amount of responsibility for it which should be understood and shared by all.

The Group Plan, as its name suggests, is a group activity for which the members of the Society are collectively and individually responsible It was conceived and organized by the Society It is operated solely for the benefit of the members under the direction and supervision of the Society as a mutual undertaking The high standards set for it by the Society have made it the most efficient and economic source of malpractice protection that can be devised and maintained in this state For that reason it has become an important factor in the professional lives of a substantial majority of the practicing members of the Society and, as such, it merits the active support of members who are fully informed as to the reasons for its existence and the details of what it stands for This booklet has been prepared to furnish that information

The Committee on
Malpractice Defense and Insurance
J STANLEY KENNEY, M.D , *Chairman*
JAMES M FLYNN, M D
THOMAS M D'ANGELO, M D

Failure of Insurance Companies to Furnish Satisfactory Protection

The Society's Group Plan of malpractice protection was made necessary by failure on the part of insurance companies to furnish satisfactory insurance and defense to medical men in this state at a time when they needed it most

Malpractice insurance was never more than a small experimental side line with the few companies which were originally interested in the business, consequently none of them was prepared to deal effectively with the situation created by the tremendous increase in the number and cost of suit and claims which occurred in this state immediately following the first World War Up to that time the insurance provided by the companies was generally regarded as sufficient for ordinary needs but, when malpractice protection became an important factor in medical practice, members of the Society became increasingly dissatisfied with their situation because

1 *The coverage provided by the companies was not adequate to meet the changing requirements of the profession* —This was due to the fact that their policy contracts were drafted by insurance men who were more interested in their own ideas of underwriting than they were in meeting the needs of practicing doctors.

2 *The legal defense furnished by the companies was seldom acceptable to defendant doctors* —This was due to the fact that the companies were obliged to delegate the defense of intricate medical cases to general insurance attorneys who had no knowledge of the medical questions involved and very little about the law governing them

3 *The cost of malpractice insurance was increasing at a rate which threatened to make it a prohibitive burden on medical practice* —Some of the companies withdrew from the business because of the high loss costs and the few remaining in it increased their rates in various amounts up to 300 per cent with nothing to prevent further heavy increases whenever, in the opinion of the companies, they were required leaving doctors no choice but to pay the increased cost or go without insurance protection.

In view of this situation, the Society concluded that an investigation should be made of the entire question of malpractice indemnity and defense to determine what if anything, organized medicine could do to improve the quality of and to reduce or control the cost of malpractice protection of the members

Preliminary Study and Conclusions

As a result of the initial study made at that time, the following conclusions were reached

1. That the insurance companies, because of in

herent limitations, would never be able to furnish satisfactory indemnity and defense without the intimate cooperation of organized medicine

2 That, in view of the great increase in the number and cost of malpractice suits, the legal defense service of the Society alone was not sufficient protection and that it should be supplemented by good insurance

3 That the only plan offering complete malpractice protection likely to succeed in this state was one which combined the indemnity facilities of a good insurance company with the legal defense service of the Society

4. That, since it was the pocketbooks and professional reputations of members of the Society which were at stake, they should have a controlling voice in drafting the kind of insurance contract they wanted and in computing their own loss costs and the rates they would be called upon to pay

When tested against the experience of numerous members and all the information which could be obtained from the companies on the subject, this analysis of the situation appeared to be correct in every respect and indicated clearly that some energetic action on the part of organized medicine was necessary to bring about any improvement in the situation

Organization of the Group Plan

Based on the foregoing conclusion, the study was continued in an effort to devise a practical scheme which would embody the ideas of the Society and, at the same time, be acceptable to a good insurance company This resulted in drafting a plan which included the following provisions

1 That a form of policy contract and coverage satisfactory to the medical profession be provided

2 That all members in good standing of the Medical Society of the State of New York and only such members be eligible for protection under the plan.

3 That all suits and claims against insured members be defended exclusively by the legal counsel for the Society at the expense of the plan

4. That the rates be computed on the basis of the actual cost of losses sustained by insured members plus a predetermined and controlled expense factor which would include a small and also controlled profit for the company in the form of a fee or handling charge

5 That the business be handled through an insurance representative of the Society who would be responsible to the Society for seeing that all the provisions of the plan were carried out as intended

In these brief but farseeing proposals, the Society provided for satisfactory coverage, eligibility of all members, expert legal defense, controlled cost, and responsible management

These proposals were submitted to all of the insurance companies known to be writing malpractice insurance in the state at that time and were declined by all of them except the Aetna Life Insurance Company, of Hartford. This company, while inclined to the belief that the idea was economically sound, doubted the workability of it largely because it was a radical departure from anything which had previously been tried in the insurance world Nevertheless, they were finally persuaded to undertake it on an experimental basis and committed the company to it

The project was then submitted to the House of Delegates which met in Brooklyn in April, 1921 where it was unanimously approved and ordered into operation It was designated as the Group Plan of the Medical Society of the State of New York and was put into operation on May 10, 1921

Although the Society believed that the Group Plan offered the only means by which efficient and stabilized malpractice protection could be provided in this state, it is doubtful if anyone connected with its organization foresaw at that time the far-reaching effects which would flow from this advent of organized medicine into control of its own malpractice insurance affairs

That the Group Plan fully accomplished every purpose for which it was organized is attested by the fact that it has now been in existence for a quarter of a century and that today it occupies a stronger and more important place in medical practice than at any time in the past

What the Group Plan Stands For

The Group Plan has not been static From time to time the form of coverage has been extended, controlled changes have been made in the rates to meet fluctuations in the cost of losses, the expense factor has been reduced, and improvements have been made in the method of handling and cost accounting

Each of these changes has been made under the direction of the Society and, where necessary, has been incorporated in the Requirements for the Group Plan.

These requirements govern the terms of the carrying agreement under which the Group Plan is operated and, as they explain better than anything else could the extent of the Society's control and what that stands for in the protection of the members, they are printed here in full

Basic Requirements for the Group Plan

(*a*) The company shall establish to the satisfaction of the Society that it desires without reservation to enter into a joint undertaking with the Society to study the problems of malpractice defense and insurance in New York State and to provide protection to members of the Society desiring it under a group plan which will place and retain in the hands of the Society maximum control over the vital elements of the enterprise

(*b*) The plan shall be a group plan of insurance

(*c*) The company shall issue to the Society as trustee for the members a master policy which will set forth all of the terms and conditions of the insurance The policy contract shall be amended from time to time to meet the needs of modern practice of medicine by agreement between the Society and the company, and no amendments shall be made in the contract except with the approval of the Society Members shall be insured under the terms of the master policy by individual certificates issued to them and each certificate shall have printed on the back thereof a copy of all terms and conditions of the master policy as amended

(*d*) The company shall issue a certificate of insurance to any member in good standing of the Society who applies for it (unless otherwise directed by the Society) at rates approved by the Society

(*e*) The company shall not issue malpractice insurance to any physician or surgeon in the State of New York except to members in good standing of the Society and to members of the Homeopathic Medical Society of the State of New York

(*f*) All suits and claims against members insured under the master policy shall be defended exclusively by the legal counsel for the Society and the cost of

such defense shall be charged to the loss experience of the Society

(g) The members insured under the master policy shall constitute a self rating group and the rates charged under the master policy shall be computed annually upon the actual loss and loss expense incurred, plus proper and agreed ratios for operating expenses and profit. There shall be no loadings in the rates for salaries, allowances, commissions, claim expense, dividends, or profit except those contained in the predetermined and allowable expense and profit ratios, and no change shall be made in those ratios except with the approval of the Society

(h) The company shall furnish the Society, upon an approved form analyzed loss vouchers approved by the legal counsel for the Society covering all expenditures for losses and loss expenses incurred and no charge for closed suits and claims shall be included in the loss experience under the master policy unless covered by such a voucher

(i) No estimated reserves for outstanding or anticipated suits and claims shall be included in the loss experience under the master policy except those approved by the legal and indemnity representatives of the Society

(j) The company shall recognize the indemnity representative of the Society as the sole representative of the Society and the broker of record for all members insured under the master policy On behalf of the Society he shall have full charge of all underwriting operations, cost accounting, and rate computations, and report directly to the Chairman of the Committee on Malpractice Defense and Insurance

The foregoing is in the charter of the Group Plan, which is unique in the insurance world. Probably there is no other insurance agreement in existence which permits the insurance buyers to draft their own policy contracts defend their own suits and claims, tabulate their own loss costs, and compute their own rates.

It would be difficult to conceive of an insurance agreement more favorable to policy buyers than this. If, in these circumstances, the Group Plan were to fail in any respect whatever it could only be because of a lack of knowledge or support on the part of the members for whose protection it exists and who, in turn, are responsible for it.

"Cheap" Insurance

The Group Plan was never designed to supply "cheap' insurance but to furnish the highest type of indemnity and defense obtainable at the lowest cost consistent with that quality

Cost alone is a poor yardstick with which to measure the value of insurance of any kind This has always been well understood by all professional insurance buyers, with whom it is axiomatic that 'good insurance is never cheap and cheap insurance is never good." Malpractice insurance is no exception to that rule.

It is significant that throughout the life of the Group Plan its rates have been lower than those of all the insurance companies which at any time have written enough malpractice insurance in this state to learn the true cost of the business here. From time to time however inexperienced companies, in an effort to attract favorable attention to themselves have undertaken to appeal to uninformed members of the Society with cheaper rates, hoping, thereby, to build up an increased volume of other and more profitable business.

Having had no reliable cost experience of their own upon which to predicate rates, these companies have adopted as a basis the comparatively low schedule achieved by the Society through its organized efforts and named slightly cheaper rates which, it was hoped, would attract members of the Society and draw them away from their own Group Plan.

There has seldom been a time when at least one of these companies has not been experimenting with the business here in this manner, and members who are influenced entirely by the cheapness of their rates will usually be able to secure a policy of malpractice insurance and defense from some one of them How ever, those who elect to follow that course should be prepared to find, when they are sued, that their protection is something less than the best which was available to them through their Society

Legal Defense

The legal defense of malpractice actions against medical men, as developed within the Society, is a specialty in law which, to be successful, requires a long and concentrated experience comparable with that essential for any specialist in medicine

It is not enough to know the general and special law applicable to malpractice actions in this state. To be successful, a defense attorney must thoroughly understand medical terminology and procedures the customs and practices in medicine, and what is considered accepted practice in both diagnosis and treatment of all kinds. In addition, he must be familiar with and have in his library the opinions of a large number of authorities on a wide variety of medical subjects. Prior to the organization of the Group Plan, it was a common complaint among insured members that the most difficult part of their defense was giving their defense attorneys a correct understanding of the medical questions involved.

This was fully understood by the Society as early as 1918 when its legal defense service was established under Mr George W Whiteside, who developed the principles of defense which were adopted by the Society and who was the first to make the efficient defense of malpractice suits a recognized specialty in his profession. Each of the attorneys who has served as legal counsel of the Society since that time had a long training in the principles established by Mr Whiteside under his immediate predecessor in office

Any insurance company could, in time, develop similarly trained defense specialists but, until malpractice insurance becomes something more than a mere sideline in their business, none of them will ever do so This is why legal defense, comparable with that provided by the Society, never has been and probably never will be furnished members who secure their insurance protection outside the Group Plan of the Society

Supervision and Management

The Group Plan is operated under the supervision of the Committee on Malpractice Defense and Insurance which reports to the Council of the Society and, through it, to the House of Delegates The Committee receives detailed reports on all phases of operation including itemized tabulations of losses and loss reserves, as verified by the legal counsel and the rate computations made in accordance with the formula contained in the carrying agreement with the company In this manner the Society is able to maintain intimate supervision of the Group Plan and to influence the various elements of it in any way necessary to protect the welfare of the members. In passing, it should be pointed out that under this

system the Society has accumulated, since 1921, the most complete and accurate data on the cost of malpractice insurance and defense in this state which has ever been assembled

Management of the Group Plan is delegated by resolution of the House of Delegates to the indemnity representative of the Society, a licensed insurance broker, who also acts as the malpractice-insurance advisor of the Society Since his appointment in 1921, the indemnity representative has had no other duty or activity All the business of the Group Plan is conducted in his name as required by the insurance laws of the State of New York

Contrary to general belief, there is an important difference between an insurance agent and an insurance broker which should be of interest to members of the Society It is usually taken for granted that all agents and brokers are representatives of insurance companies but such is not a fact

An agent represents and is responsible to the company which appoints him and insurance buyers have nothing to do with the relationship On the other hand, an insurance broker, under the insurance laws of the state, is a representative of and responsible to the policy buyer, whose business he handles He is obliged to use his knowledge and best efforts for the benefit of the buyer and, if his failure to do so results in injury to the buyer, he may be held liable for his negligence the same as a lawyer or doctor He has no authority to speak for, nor are any of his acts binding upon an insurance company, but statements made by him to an insurance company on behalf of a buyer are binding upon the latter He is appointed by and may be dismissed by the insurance buyer and all companies are bound to abide by the decision of the buyer in this respect

Acting under appointment by the Society and the obligations and limitations fixed by law as indicated above, the indemnity representative is as responsive to direction and control by the Society as any of its retained or salaried officials

The income of the indemnity representative is derived from commissions which are included in and limited by the expense factor which is approved by the Society for inclusion in all computation of rates Out of that income, however, all expenses incident to operating the Group Plan on behalf of the Society are borne Thus, the Society is able to maintain an indemnity department and responsible management of the Group Plan without cost to itself

Regulations Governing Malpractice Defense and Group Insurance*

Uninsured Members—The Medical Society of the State of New York will furnish to its members the services of the Counsel of the Society in actions brought for alleged malpractice, error, or mistake done or claimed to have been done in the legitimate performance of the duties of their profession as physicians under the following regulations

The Counsel of the Society will serve as attorney in all actions for alleged malpractice, brought against members in good standing, who must be so certified by its Secretary, excepting as follows

Members shall not be entitled to malpractice defense if the acts in the suit for which they make application for defense were committed prior to their admission to membership in the State Society

Members shall not be entitled to malpractice defense if the acts in the suit for which they make application for defense were committed during a period when they were not in good standing, according to the Bylaws

Members shall not be entitled to malpractice defense while residing and/or practicing medicine or surgery outside of the territorial limits of the State of New York

The Society will not undertake the defense of any member who, after consideration by the Council, is believed guilty of criminal abortion, feticide, homicide, or any criminal act or who has not complied with the recognized ethical laws in regard to these cases

Members shall agree not to compromise any claim against them, the defense of which has been undertaken by the Society nor to make settlement in any manner without the advice or consent of the Society given through its attorney

In the event that a member sued or threatened with suit shall, without the advice or consent of the attorney of the Society, determine to settle or compromise any claims against him, he shall reimburse the Society for the expense incurred in undertaking his defense, and in default thereof, he shall be deprived of further privilege of malpractice defense

The Society shall not assume any responsibility for the payment of any sum agreed upon by arbitration in the settlement of claims, or awarded by court verdicts, or for making payments for any purpose whatsoever

Members of the Society desiring to avail themselves of the privileges of this act shall make application therefor in writing to the Secretary of the Society, and it shall be shown to his satisfaction that they are members in good standing They shall also furnish the Legal Counsel a complete and accurate statement of their connection with, and treatment of, persons upon which complaints against them are based, giving dates of attendance, names and residences of nurses and of other persons cognizant of facts and circumstances necessary to a clear and definite understanding of all matters in question, and shall furnish such other relevant information and execute such papers as may be required of them by the attorney of the State Society

In the event of any difference of opinion between a member of the Society and the Counsel concerning the eligibility of a claim for defense, or any other matter having to do with malpractice defense, all details shall be presented to the Committee on Malpractice Defense and Insurance to be referred with recommendations to the Council for its decision

The foregoing regulations are subject to such change as may from time to time be authorized by the Council or the House of Delegates

Members Insured Under the Group Plan—All members in good standing shall be entitled to malpractice defense and indemnity in the Group Plan of Insurance on payment of the premium due on the policy selected, but the amount of insurance protection granted to any member may be limited at the discretion of the Council, subject to petition for reconsideration

When upon the final completion of the defense of any suit or claim it shall appear to the satisfaction of the Council that the medical procedure, conduct, or attitude of the member involved was such that it could not have the approval of competent medical opinion generally and that the continuance of such medical procedure, conduct, or attitude would constitute a burden to the Society's Group Insurance Plan more hazardous than that contemplated in what is generally accepted as the competent practice of medicine, the Society shall have the right to with-

* Adopted by the House of Delegates April 3, 1933 and amended by the Council, December 13, 1945

draw from such member the privilege of renewal of his indemnity insurance under that Plan. Nothing in this rule shall deny such member a rehearing by the Council. This rule shall also not abrogate such member's right to subsequent malpractice defense by the Society.

If an assured shall fail to maintain in good standing his membership in the State Society, according to the Bylaws, the policy, so far as it applies to such assured, shall be canceled as of the date upon which he ceased to be a member in good standing. A notice to this effect shall be mailed to the member's last address, and the Company will return upon demand and surrender of his certificate the unearned premium due him on account of such cancelation. If the member is reinstated by payment of dues the former policy cannot again be put in force, but the member can secure a new policy as of the date of reinstatement of his membership in the Society to good standing.

The Group Plan of Insurance shall insure a member in accordance with the insuring clause of the master policy issued to the Society which with the approval of the Council or House of Delegates, shall be amended from time to time to meet the changing requirements of medical practice and the loss experience as developed by the Group Plan of Insurance.

The Group Plan policy shall not cover the liability which an insured member may have on account of injury to patients from causes other than medical treatment, care, or advice, nor for injury to persons other than patients from any cause whatsoever. Protection on account of such losses can only be had under general liability or workmen's compensation insurance.

When in the course of duties imposed upon him as a medical officer of the State or any political subdivision thereof an insured member shall be required to render medical opinion he shall be fully protected under his Group Insurance against the consequences of such an opinion provided it shall have been given to competent authority and not made public by him.

All members desiring insurance protection in the Group Plan of the State Society shall secure that protection through the Indemnity Representative of the Society, who shall be the broker of record for such members in accordance with the insurance laws of the State of New York.

A doctor applying for membership in the Society for the first time may secure malpractice insurance protection under the Group Plan of Insurance under a temporary binder as soon as his application for membership has been filed with his county society, provided that such temporary binder shall be canceled back to the date of its issue with no liability on the part of the Group Plan of Insurance in the event that his application for membership is not favorably acted upon by the county society within six months after the date of filing.

Protection under the Group Plan of Insurance of any member or applicant for membership in the Society may commence on any day of the year, holidays included, provided that in no event shall it become effective prior to the date on which the application for such protection is placed in the United States mail as shown by the postmark on the envelope in which it was mailed.

Members Insured by Companies Other Than the Carrier of the Group Plan.—A member who elects to secure malpractice insurance protection from a company other than the carrier of the Group Plan shall have the same right of defense by the Counsel of the Medical Society of the State of New York as those members not insured, provided said carrier is authorized to do business in the State of New York. If the member desires this service under the circumstances, all the regulations as detailed above applying to uninsured members must be observed. At the time the action is begun, and not later, the Secretary of the Society shall be furnished with the name of the insurance company, policy number, date of policy and amount of insurance carried. There shall also be presented at the same time a letter from an authorized officer of the insurance company certifying that the company will assume the full cost of the defense, including the fees of the Counsel of the Medical Society of the State of New York similar to those paid by the carrier of the Group Plan in like instance. Also that he shall not be required to consult with or receive instructions from the company as to the manner of defense, and that the company will accept his opinion as to the final disposition of the action.

Insurance companies, other than the carrier of the Group Plan, usually compel the holders of their policies to accept defense by attorneys of the companies but it is desirable that members insured in such companies have the privileges of defense by the Legal Counsel of the Medical Society of the State of New York, provided their insurers meet the requirements stated above. Except as provided above the Legal Counsel of the Society cannot be required to assume responsibility for the defense or appear as associate counsel in any case in which a company other than the carrier of the Group Plan is involved but, if requested, he shall render to the attorney of such company a consultant's opinion provided the company concerned shall compensate him for such service on a basis comparable with the compensation he would receive from the carrier of the Group Plan for similar services.

All previous resolutions heretofore adopted, pertinent to malpractice insurance and defense, are hereby rescinded.

NURSING AWARDS POSTPONED UNTIL SEPTEMBER 20 1946

The McGraw-Hill Book Awards in Nursing Education, which were originally scheduled to close on March 15, 1946, have been postponed until September 20, 1946. This postponement has been found advisable principally because many authors who signified their intention of competing have been too heavily loaded with war work to complete papers.

The postponement will in no way interfere with their publishing program. Competing authors will have their manuscripts considered for publication immediately upon receipt. Acceptable manuscripts will be published and promoted without delay, regardless of this postponement, and considered for an award following the new closing date.

Department of Workmen's Compensation

MAURICE J DATTELBAUM, M D , Chairman, and DAVID J KALISKI, M.D , Director

THE following letter was received recently from the Chairman of the Workmen's Compensation Board, Miss Mary Donlon The matters discussed are of great importance to the proper administration of the Workmen's Compensation Law and physicians are respectfully requested to give full attention to same It is addressed to all physicians practicing under the Workmen's Compensation Law

Dear Doctor

The enclosed handbook is made available to New York State physicians authorized by the Chairman of the Workmen's Compensation Board, or under prior statutory authority by the Industrial Commissioner, to render medical care to workmen's compensation claimants I invite your careful consideration of the standards for the several ratings established by the Medical Practice Committee* for counties of 1,000,000 or more inhabitants, and indicated as the standard for uniformity in the practice of industrial medicine in this State

It is the common problem of administration and physicians to expedite the payment of compensation awards to industrially disabled workers, so that they may receive such payments promptly in lieu of biweekly wage payments as the law provides The physician's medical reports are essential to the determination of compensation claims, and physicians should cooperate by filing such reports promptly as required I am sure you know that in order for the charges of a physician to be valid and enforceable against the carrier, the physician is required to conform to the following requirements as to the filing of his reports with the Chairman of the Workmen's Compensation Board

C-104—Preliminary report should be filed within *forty-eight hours* after first treatment

C-4—Complete report should be filed within *fifteen days* after the C-104, but not later than *seventeen days* after treatment

C-14—Progress reports should be filed at not less than *three-week* intervals, and more frequently if required

No physician can justly complain of the nonpayment of his bills, if he fails to comply with these reasonable reporting requirements

The attention of physicians is also directed to the following important procedures in continued treatment and physiotherapeutic treatment cases When a physician is notified by the carrier that treatment is no longer indicated based on the carrier's medical evidence, and the physician in his judgment believes, nevertheless, that continued treatment is necessary, he should, in writing, request the Chairman of the Workmen's Compensation Board to make impartial examination of the case and until such impartial examination is held, continue to treat the injured employee When the total fee for physiotherapeutic treatment approaches the sum of $25, the physician should file the additional C-4 report and request authorization as prescribed in section 13-a-5

Physicians are reminded that under the provisions of the Workmen's Compensation Law, as amended, only those pathologic and x-ray laboratories licensed by the Chairman are authorized in x-ray and clinical diagnosis and treatment of injured workmen under the Workmen's Compensation Law Physicians who are authorized to render medical care under the Workmen's Compensation Law should ascertain whether laboratories to which they refer matters under the Workmen's Compensation Law have been authorized or licensed to perform x-ray or clinical diagnosis under the Workmen's Compensation Law All physicians should take notice that anyone knowingly referring compensation claimants or cases to unlicensed laboratories may be subject to the filing of charges under Section 13-d of the Workmen's Compensation Law

Medical benefits payable in New York State under the Workmen's Compensation Law now aggregate annually upwards of $20,000,000 This is financed not by public funds, but by direct charge on industry, and under our law the disabled worker is permitted free choice of his physician Those who prefer free choice to other proposed schemes of medical care should recognize an obligation to justify their preference by cooperating with the workmen's compensation administration

I seek your professional assistance and also your civic interest in the efficient and effective functioning of workmen's compensation benefits for disabled workers in our State Please feel free to write me whenever there are matters which you think should come to my attention

MARY DONLON, *Chairman*

* Similar standards are now and have been for a number of years used by the various compensation committees of other county societies as a basis for granting ratings to physician applicants

---

THE RIGHT ANSWER

A touring eastern go-getter spied a lazy Indian chief lolling indolently at the door of his teepee somewhere out west

"Chief," remonstrated the go-getter, "why don't you get yourself a job in a factory?"

"Why?" grunted the chief

"Well, you could earn a lot of money Maybe 30 or 40 dollars a week "

"Why?" insisted the chief

"Oh, if you worked hard and saved your money, you'd soon have a bank account Wouldn't you like that?" "Why?" again asked the chief

"For gosh sakes!" shouted the exasperated go-getter "With a big bank account you could retire, and then you wouldn't have to work anymore "

"Not working now," pointed out the Indian —*J Am Inst Homeop , Dec , 1945*

Medical News

Army Again Speeds Doctors' Release

UNDER a new demobilization plan, effective immediately, all but four thousand of the forty-one thousand doctors commissioned in the Army from civilian life will be returned home for separation not later than June 30 Robert P Patterson, Secretary of War, said on Febrnary 1

The regulations provide that physicians and dentists, with the exception of eight hundred scarce medical specialists whose services are needed by the Army, will be separated if they qualify under any one of these criteria (1) sixty points, (2) 45 years of age, (3) thirty nine months of active duty

This represents a reduction of five points in the score and three months in length of service from regulations previously in effect

The program has resulted in separation of twenty-five thousand Army doctors since V-E Day, Mr Patterson reported Another five thousand are on the way home or are in process of separation, and under the new plan seven thousand more will be eligible for release progressively in the next five months.

The rapidity of the program, which Secretary Patterson said was not thought possible as recently as two months ago, has been advanced by use of graduates of the Army Specialized Training program to replace civilian doctors

Maj Gen. Norman T Kirk, Surgeon General, promised that officers would be either separated or on the way to the United States for discharge within thirty days after they become eligible In the case of specialists, it would take sixty days, he said

By March 1, General Kirk said, every physician and dentist with sixty points, except specialists would be out of the service or on his way home from overseas by "fastest available means of transportation." Medical specialists with seventy points will be released or on the way home not later than April 1 and those with sixty points by June 1

Officers returned from overseas or surplus to requirements of a major command will be separated if they are within four months of the period of service or age which would make them eligible for release

Separation criteria for scarce specialists will be seventy points, 45 years of age, or forty five months of active service, but, on April 1, the point score will be reduced to sixty

Veterinary, Sanitary, and Medical Administrative Corps officers are eligible for relief from active duty if they have sixty points, or if they are 42 years old, or have had thirty-nine months of active duty

Army Nurse Corps officers will be released with twenty-five points, or if they are 30 years old, or with eighteen months of active duty For dietitians and physical therapists the length of service requirement is twenty four months.

County News

Albany County

The Albany County Medical Society met at 8:30 P M on January 30 in the auditorium of Albany College of Pharmacy

Following a business session members heard a talk by Dr Arthur H Blakemore, assistant professor of surgery at the College of Physicians and Surgeons and assistant surgeon at Presbyterian Hospital and Vanderbilt Clinic, who spoke on "Clinical Application of Nonsuture Method of Blood Vessel Anastomosis Using Vitallium Tubes"

At this meeting Dr Homer L. Nelms received a framed resolution of appreciation. Dr Arthur J Bedell presented the resolution to Dr Nelms, new vice-president of the medical society "on the occasion of his relinquishing the office of secretary, which he has held for the past sixteen years.' Dr Nelms was praised for his "skill and fidelity" The new secretary is Dr Albert Vander Veer *

Broome County

Dr John Green, recently discharged from the Navy as lieutenant commander, has returned to the podiatry department of the Endicott Johnson Washington Avenue Medical Department, Binghamton, after more than four years' absence

Discharged January 2 Dr Green was separated from the Navy in October and returned home on terminal leave in December *

HISTAMINE THERAPY The therapeutic efficacy of histamine in rheumatoid, arthritic and neuralgic affections has been repeatedly confirmed by clinical studies. Imadyl Unction 'Roche' combines the potent vasodilating effect of histamine with the dependable analgesic action of salicylates. Its application — by simple massage — stimulates sluggish local circulation, brings a pleasant sensation of warmth to the affected area, and markedly relieves pain and discomfort This singular effectiveness of Imadyl Unction makes it a particularly valuable remedy for the relief of rheumatoid, arthritic and neuralgic aches and pains. Supplied in 1½ oz. tubes and 1 lb jars.

U S Hospitals Open to All Veterans

PRESIDENT Truman has rejected a Veterans Administration suggestion that hospital admission be restricted to service-disabled cases, it was announced on January 31

The Veterans Administration therefore will continue to accept all veterans for treatment of all ailments, within the limits of bed capacity

One high V A official, who plugged for the restriction, said the result may be a guarantee of life hospitalization, free, for twenty million veterans

Maj Gen Paul R Hawley, V A medical director, said the policy will be followed until such time as the Veterans Administration is instructed differently

He declined to discuss its merits or possible results Implementing the open-door policy, the V A announced that an agreement has been reached with the Michigan Hospital Association to put service-connected Michigan cases in private hospitals

V A officials said the effect of the Presidential decree is to free more bed space in veteran's hospitals for nonservice-connected cases, which, by law, are to be hospitalized only when bed space is available

The restriction was suggested by V A Administrator Gen Omar N Bradley as a temporary expedient to relieve overcrowding The 90,000-patient load is now over two thirds nonservice-connected

State Is Seeking Army Release of Four Hospitals

NEW York State needs the four hospitals it leased to the Army, including Mason and Halloran General, and is anxious to get them back as soon as possible, Dr Frederick MacCurdy, State Commissioner of Mental Hygiene, said on January 3

An increase in the number of mental patients throughout the state is straining present facilities and the only solution lies in regaining the hospitals, he said

Dr MacCurdy said the leases on the hospitals expire June 1 and he indicated that the state would be very reluctant to renew them

Particularly needed are the four thousand-bed Halloran General Hospital, at Willowbrook, Staten Island, and the twenty-three-hundred-bed Edgewood Hospital at Deer Park, Long Island Dr MacCurdy said that with the rate of patient increase the state could also use Mason General Hospital's facilities of fifteen hundred beds, at Brentwood, L I , and the twelve hundred-bed portion of the Rockland State Hospital, now being used as Camp Shanks Station Hospital in Orangeburg

The office of the Army Surgeon General in Washington would not say when any of the hospitals will be returned to the state They would say only that negotiations with this in view are proceeding and that a certain number of hospitals throughout the country would be returned by April 1

Dr MacCurdy said that the need for Army hospitals was decreasing but that the need for veterans' and state hospitals was urgent He pointed out that only Army personnel may be treated at Army hospitals, and said that once a man is discharged from the Army he must rely on the veterans' facilities or the state for medical aid

The state needs the four hospitals to meet the $120,000,000 program it has set for medical care, particularly mental treatment, Dr MacCurdy said There are now 103,000 mental patients being cared for by the state, and all state hospitals are overcrowded, he added

Dr MacCurdy said the medical program calls for medical-surgical buildings for the better treatment of acute mental cases, the special training of psychiatrists, and an effort to unsnarl the neurotic disturbances of children

Improvements

Hospital Commissioner Edward M Bernecker presided at the dedication of the new department of roentgenology at Sydenham Hospital, New York City, on January 12

Named after the late Lt Lester N Hofheimer, killed in a plane crash in the Burma-India theater in 1943, the new department has $42,000 worth of equipment purchased with funds from Lt Hofheimer's estate *

• •

Dr George C Adie was re-elected president of the New Rochelle Hospital Medical Board on December 27 This is Dr Adie's third term as president

Dr E Leslie Burwell was elected vice-president to succeed Dr Clarence Read, and Dr Sigurd Sandzen was elected secretary to succeed Dr Burwell *

•

Capt Benjamin Lewis, of Binghamton, on terminal leave from the U S Medical Corps, has been named temporary acting superintendent of the Broome County Tuberculosis Hospital, effective January 1

Dr Earl W Mungle, president of the hospital board of managers, said the Binghamton army officer, who was on terminal leave and awaiting discharge from military service, had accepted the position "on a temporary basis"

He will serve until Dr Max Eber, former assistant superintendent of the hospital who is in military service in France, receives his discharge and returns, presumably to take over the hospital superintendency, Dr Mungle said *

• •

Thomas T Murray has been engaged as administrator of the Hudson City Hospital and will assume his new duties on January 1, 1946 He succeeds Miss Julia Dougher, who submitted her resignation several weeks ago

At the present time, Mr Murray is assistant administrator of the Lenox Hill Hospital in New York City and some years ago he was associated with the Memorial Hospital in Albany

Mr Murray is thoroughly experienced in hospital administrative work and for over thirty years has engaged in such capacity in leading hospitals in Canada and eastern United States *

• • •

Capt William C Emm, former Syracuse physician, has been appointed to the staff of Rhoads General Hospital, Utica

Commissioned in October, 1942, Captain Emm served for ten months in the European theater with the 123rd Evacuation Hospital and the 195th General Hospital, returning to the States October 12 He wears the ETO ribbon with two campaign stars, the American theater ribbon and the victory ribbon *

• • •

The Keller Clinic, in Westhampton Beach, was reopened directly after Christmas, and the hospital was to reopen late in January or early in February, Dr Donald R Keller, who has just returned from three years' service in the Navy, announced Dr Keller, who practiced in Westhampton Beach for eight years before entering the service, is having the entire clinic redecorated, and hopes to begin the building of a new addition, a maternity pavilion, as soon as building conditions permit, probably late in 1946 *

Newsy Notes

Acquisition of a 35-acre tract on New Scotland Avenue, Albany, as the site of the new $10,000,000 Veterans Administration Hospital has been ordered by President Truman

The property, bounded by New Scotland, Myrtle, and Holland Avenues, is across the street from the Albany Hospital and the Albany Medical College *

• • •

A drive to raise $2,500,000 to construct a new building for Beth David Hospital, New York City, was started on January 6 at a dinner at the Waldorf-Astoria Hotel, Harry W Golding, first vice-president of the hospital and chairman of the campaign, announced that $300,000 already has been contributed.

Emphasizing the need for expanded facilities, Mr Golding said the hospital's wards and rooms *are constantly occupied to capacity*

"With the return of *millions of* servicemen and a sharply increasing use of voluntary health and insurance plans, Beth David Hospital will be called upon to play an ever-increasing part in the hospital service of our city," he declared *

• • •

Four hospitals in Albany have been awarded full approval by the American College of Surgeons, Dr Malcolm T MacEachern, associate director, has announced They are Albany, Brady Maternity, Memorial, and St Peter's hospitals *

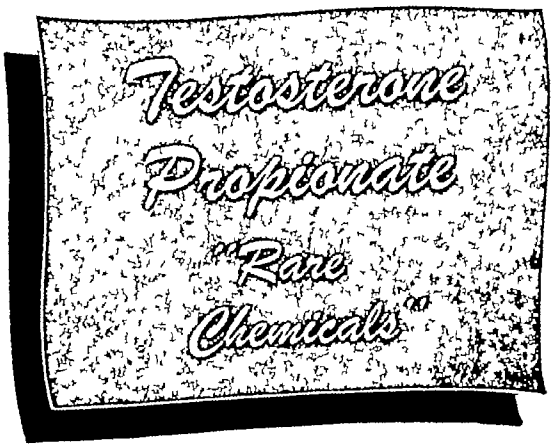
• • •

One hundred beds in Rhoads General Hospital have been made available to patients of the U S Veterans Administration Facility, Col A J Canning, commanding officer officer, has announced

The move was made after an appeal by Charles F Sargent, manager of V A.F affairs in thirty-one counties in Central and Western New York, who said there now exists a backlog of veterans awaiting treatment

Use of Army and Navy hospitals, as well as a number of civilian hospitals, to handle this backlog is in keeping with the policy of Maj Gen Paul R. Hawley, acting surgeon of the V A.F, who said that beds for more than forty-thousand veterans would be "borrowed."

The one hundred beds at Rhoads will be loaned to the V A.F until such time as that organization is able to provide sufficient facilities for its patients Col Canning emphasized the lending of these beds does not mean that veterans in need of medical care may report directly to Rhoads Patients will be accepted there only through official transfer *



• • •

[Continued from page 556]

Kulp, trustees, and Mrs M Lovell, Floyd Springer and Clifford Morgan

At the session by-laws were revised *

• • •

The annual meeting of the Benedict Memorial Hospital Association, Ballston Spa, took place on January 14 in the hospital. At this time reports were given and three directors were elected to succeed Frank Winney, Edward Dechants, and Ralph Dunton, whose terms of office have expired *

• •

The Edgewood annex of Mason General Hospital, Brentwood, built at a cost of $9,500,000 and occupied only fourteen months, will be closed by the Army March 31, reducing the total bed capacity of the hospital to less than half

The surprise announcement was made simultaneously on January 10 by a hospital spokesman and the War Department in Washington *

• •

Utica State Hospital is among ten state hospitals in the country commended by the Starry Cross, a Humane Society for improving care of the mentally ill, with offices in Great Barrington, Massachusetts

Organizations consulted in making the lists included the American College of Surgeons, American Medical Association, American Psychiatric Association, National Committee for Mental Hygiene, and U S Public Health Service

It was pointed out that since periodic inspections of all hospitals is impossible, the lists are unofficial but based on general information and belief The Utica Hospital and Middletown State Homeopathic Hospital, Middletown, were the only ones listed from this state *

• • •

William Pond Phipps, chairman of the board of trustees of the Port Chester United Hospital, announced on January 17 that the Life Savers Corporation had contributed $100,000 to the $1,000,000 building drive being conducted by the hospital The fund will be used to enlarge the institution *

• • •

Hilton has been assured of a new hospital as the result of the drive for funds for the proposed Lakeside Memorial Hospital The total amount pledged is in excess of $146,000

Of this amount the Town of Parma turned in a total of nearly $4,675, $2,460 of which came from residents of the village, $1,287 from the section north of the village and $848 from the territory south of the village Included in the total amount received in the village is a contribution from the Hilton Fire Department of $250 *

• • •

The Wyckoff Heights Hospital building fund has been given a boost by a $1,000 contribution from the S M Frank Company, of Richmond Hill, of which Ferdinand L Feuerbach is treasurer No formal campaign for funds has been started yet by the hospital

Herman Ringe, of Ridgewood, the hospital president, recently announced the institution planned to erect a new wing with approximately one hundred and fifty additional beds The project, he said, will cost $500,000 *

• • •

Five more memorial subscriptions, totalling $43,409, have been announced by the Albany Hospital building fund committee Donors include Mr and Mrs Lewis S Greenleaf, $18,059, to dedicate a research laboratory, Mr and Mrs Alfred Renshaw, $15,000, for an examining room in the physiotherapy department, Mrs William R. Whitfield, $6,000, for an instrument room, William W Farley, $2,400, for a treatment room in the psychiatry department in memory of his wife, Marie H B Crowe Farley, and John Griffin, $1,500, to dedicate a bed in a four-bed ward

---

NEW SMALL X-RAY IS PUT ON DISPLAY

A new miniature x-ray apparatus, the development of which took three years, was demonstrated to the public for the first time on October 19 at the Museum of Science and Industry, New York City, with the aid of a dozen children sent by the Board of Education

Under the sponsorship of the United Hospital Campaign, the demonstration of the new machine, a 70-mm unit used for screening indications of disease, marked the fiftieth anniversary of the discovery of the x-ray by Wilhelm Conrad Roentgen

With the use of a recent discovery known as a phototimer by Dr Russel H Morgan and Dr Paul Hodges, of the University of Chicago, the miniature unit operates without the need for measuring the patient's chest and speeds up the process so that a thousand chest pictures may be taken in an eight-hour day

Capt Milton Birnkrant, an Army physician associated with the tuberculosis control division of the Public Health Service Department, pointed out that, while previously the cost of an x-ray picture was about sixty cents, the new smaller picture can be taken for only three cents

He said the unit was engaged in a two-month survey of Harlem—an area where the tuberculosis mortality for Negroes is approximately five times as great as the average for the white population in the city as a whole

Bridge the "nutritional gap"

The nutritional benefits of milk need not be deprived the "milk sensitive" patient, even though successful treatment demands complete elimination of the offending food from the diet.

Clinical evidence has established MULL-SOY as an effective hypoallergenic substitute for cow's milk. This concentrated, emulsified soy bean food—homogenized and sterilized—closely approximates cow's milk in protein, fat, carbohydrate and mineral content. It is palatable, well tolerated, easy to digest and easy to prepare. Infants (particularly) thrive on MULL-SOY, and take it readily

Write for copies of "TASTY RECIPES FOR MULL-SOY IN MILK FREE DIETS", for your milk allergic patients

BORDEN'S PRESCRIPTION PRODUCTS DIV., 350 MADISON AVE., NEW YORK 17, N. Y.

Specialties for Diseases of the Heart and Blood Vessels

In chewing Aspergum, the patient releases a soothing flow of saliva laden with acetylsalicylic acid—bringing the analgesic into prolonged contact with pharyngeal areas which often are not reached, even intermittently, by gargling or irrigations. The stimulation of muscular activity aids in the elimination of local spasticity and stiffness, increasing patient comfort, permitting an earlier ingestion of nourishing food hastening convalescence.

INDICATIONS: Post tonsillectomy care, acute and chronic tonsillitis, pharyngitis, scratchy throat of influenza, grippe, etc.

Ethically promoted—never advertised to the laity

Dillard's

Aspergum

is most palatable . . . readily accepted by all including children.

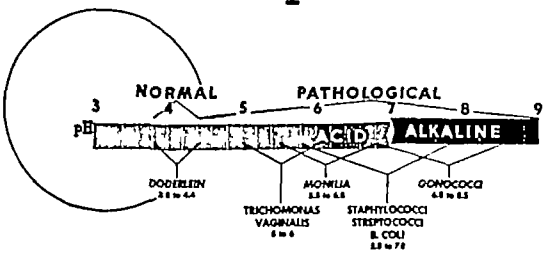
Supplied—In 7½ grains with and without Phenobarbital ½ grain, in 5 grains with Potassium Iodide 2 grains and ¼ grain, and in 3½ grains without Phenobarbital tablets, not enteric coated, the same potencies for comparison



The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE

to control frequency and severity of attacks in **CARDIOVASCULAR AND RENAL DISEASES** *and to prevent* **EDEMA**

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin The enteric coating (especially developed for Theodate) permits larger doses without the drug's contact with the Gastric Mucosa

Control the pH

In acute or chronic vaginitis, Floraquin restores the normal pH, destroys pathogenic organisms and promotes rehabilitation of the vaginal mucous membrane with respect to its glycogen content.

FLORAQUIN contains the nontoxic protozoacide, *Diodoquin*, together with lactose and dextrose. This product of Searle Research brings about the reestablishment and maintenance of the normal range of vaginal acidity (pH 3.8 to 4.4) unfavorable to vaginal infections

FOR OFFICE INSUFFLATION—Floraquin Powder in bottles of 1 oz. and 8 oz.

FOR HOME ROUTINE—Floraquin Tablets in boxes of 24.

Floraquin is the registered trademark of G. D. Searle & Co., Chicago 80, Illinois

"very satisfactory in securing prompt and prolonged relief" in bronchial asthma. says Dees (J Allergy 14 492, 1943) of Aminophyllin rectal suppositories

ACCEPTED AMERICAN MEDICAL ASSN. Council on Pharmacy and Chemistry

Very satisfactory are...

DUBIN AMINOPHYLLIN RECTAL SUPPOSITORIES (0.36 Gm. each)

Dubin Aminophyllin (theophylline ethylenediamine) also in Tablets, Ampuls, Powder for rapid action in many indicated cardio respiratory conditions

TABLETS, gr. 1½ (0.1 gm.); grs. 3 (0.3 gm.) AMPULES, 2cc. (7½ grs.); 10 cc (3½ grs.); 20 cc. (7½ grs.)

H. E. DUBIN LABORATORIES, Inc., 250 East 43rd St., New York 17, N.Y.

no deception here

The false sense of security engendered upon resort to narcotic or anesthetic agents in the medical management of hemorrhoids is dangerous. For these drugs may mask more serious rectal pathology by dulling the normal sensory warning mechanisms.

With Anusol'® Hemorrhoidal Suppositories effective relief is obtained without deception By means of decongestion, lubrication and protection, Anusol' Hemorrhoidal Suppositories bring comfort promptly while enhancing early reversal of the varicose process all without resort to narcotics or anesthetics styptics or hemostatics.

A Fundamental Approach

TO SULFUR METABOLISM

HYDROSULPHOSOL

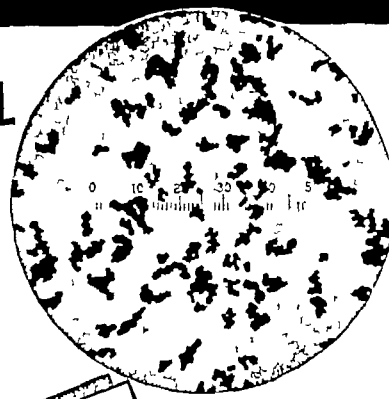

Illustration showing flowers of sulfur magnified 82X small divisions = 10 microns. The size of the colloidal sulfur particle in Hydrosulphosol is estimated at 1/1000 of a micron or 1/10,000 of the small division particle illustrated.

A true solution of sulfur bearing compounds resulting solely from the reduction of flowers of sulfur by a catalytic process. In aqueous solution, it is capable of releasing its unusually high concentration of sulfhydryl ion in readily utilizable form without evidence of toxic reaction.

Its therapeutic importance may best be evaluated by the fact that the —SH radical of the cysteine forms the active group in glutathione, alone of reported importance in connection with tissue oxidations.

Hydrosulphosol is indicated in the management of burns, ulcers and pathological conditions in which sulfur metabolism is a clinical consideration.

MERIDEN, CONNECTICUT

. . . FOR THE "LET-DOWN" FEELING

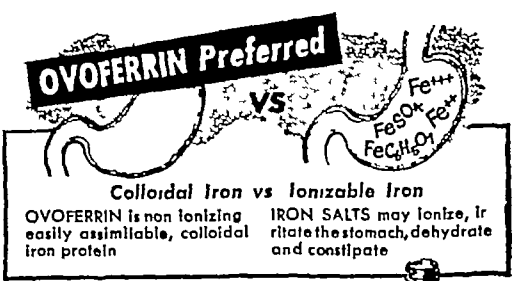
THAT OFTEN COMES WITH YEARS

FREQUENTLY the lassitude and "let-down" feeling of the elderly patient is attributable in some measure to simple hypochromic anemia

In these cases, physicians find Ovoferrin a hematinic of value combating the anemia, helping to raise the hemoglobin level, without the undesirable side-effects to which elderly patients are sensitive No digestive disturbances, no constipation Ovoferrin is pleasant to take, palatable, odorless Stimulates appetite Doesn't stain teeth or injure tooth enamel.

Non-ionizing, Ovoferrin enters the gastro-intestinal tract as a fully hydrated oxide in colloid state Provides needed iron protein in readily absorbable and assimilable colloidal form.

A valuable hematinic in nutritional anemias, in convalescence, in debility states, in pregnancy, in adolescence.



Available at drugstores in 11 oz. bottles Dosage One tablespoonful in water at mealtime and at bedtime.

HOW OVOFERRIN ACTS IN THE BODY

in the mouth Pleasant and palatable, Ovoferrin is almost tasteless Doesn't stain teeth or destroy tooth enamel

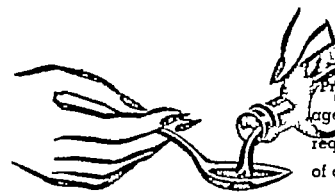
in the stomach Ovoferrin is stable, non-irritating Non-ionizable, its colloidal structure remains practically unchanged by gastric juices Passes on ready for further assimilation

in the intestine. Entering here in colloidal form, Ovoferrin iron is readily absorbed, utilized A stable hydrous oxide that has neither dehydrating nor astringent action. No distressing side-effects, no constipation

Colloidal Iron vs Ionizable Iron

OVOFERRIN is non ionizing easily assimilable, colloidal iron protein

IRON SALTS may ionize, irritate the stomach, dehydrate and constipate



OVOFERRIN

COLLOIDAL ASSIMILABLE IRON

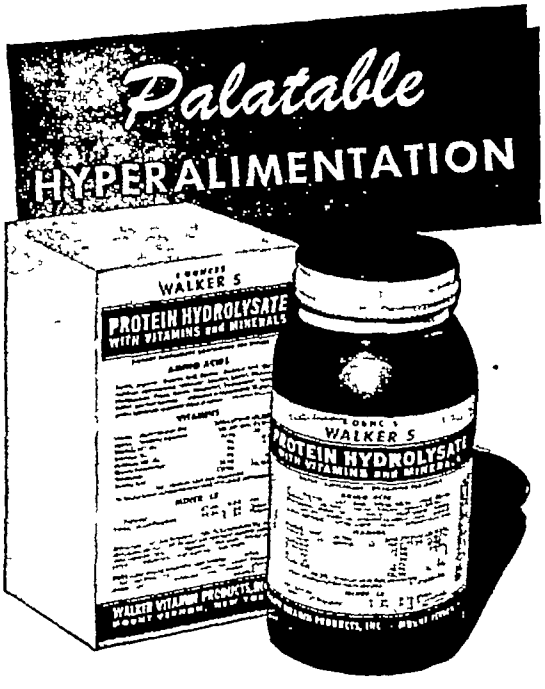
FITTING ESTROGENIC THERAPY TO THE CASE

"Premarin" Liquid, No. 869 for greater flexibility of dosage and to provide a graduated estrogenic intake where required. Each teaspoonful is the equivalent, in potency, of one "Premarin" Half-Strength Tablet, No 867

"Premarin" Tablet, No. 866 for severe estrogenic deficiencies requiring a highly potent yet essentially safe and well tolerated preparation. Full therapeutic doses of "Premarin" induce a prompt response as judged by vaginal smears and by relief of subjective symptoms.



"Premarin" Tablet, Half-Strength, No 867 for average cases which can be controlled with less than full therapeutic doses. It is recognized that, in the menopause the smallest effective dose of an estrogen is the *optimal* dose

ACCEPTED AMERICAN MEDICAL ASSN. Council on Pharmacy and Chemistry

Highly Potent • Orally Active • Water Soluble • Naturally Occurring • Essentially Safe • Well Tolerated • Imparts a Feeling of Well-Being

"Premarin"

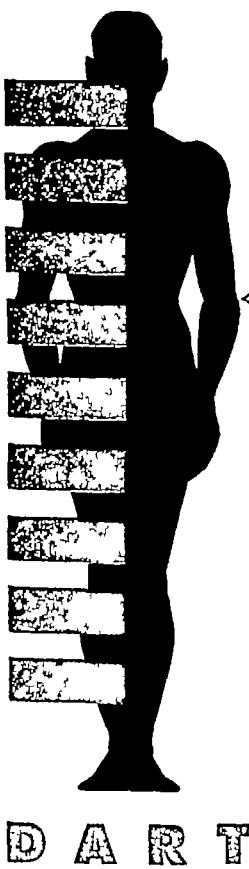
Multiphasic Therapy



in the SYSTEMIC APPROACH TO ARTHRITIS

EACH CAPSULE OF DARTHRONOL CONTAINS:

- Vitamin D (1
- Vitamin A
- Vitamin E
- Vitamin B
- Vitamin B
- Vitamin C
- Niacinamide
- Calcium Pan
- Mineral Nonu

* Equivalent in biological activity to 3 mg of Alpha Tocopherol

"Rheumatoid arthritis is a systemic disease, the patient must be treated as a whole, rather than have local treatment to his joints alone"*

THIS statement by the American Rheumatism Association Committee is the keynote of the present successful method of treating arthritic patients To produce the best results anti arthritic therapy must combat not only the joint changes, but also the systemic disturbances so frequently encountered in chronic arthritis This systemic approach requires a multiphasic therapeutic regimen which must include correction of disturbed physiologic functions, optimal nutrition, elimination of foci of infection, mental and physical rest, supervised exercise, physical therapy, and orthopedic measures

Because of its rational composition, Darthronol merits inclusion in every anti-arthritic program The combined pharmacodynamic and nutritional influence of its nine active ingredients makes it an efficacious therapeutic measure whenever the chronic arthritides must be combated

*The Primer on Arthritis prepared by a Committee of The American Rheumatism Association and published in The Journal of the American Medical Association, volume 119 page 1089, August 1 1942.

DARTHRONOL

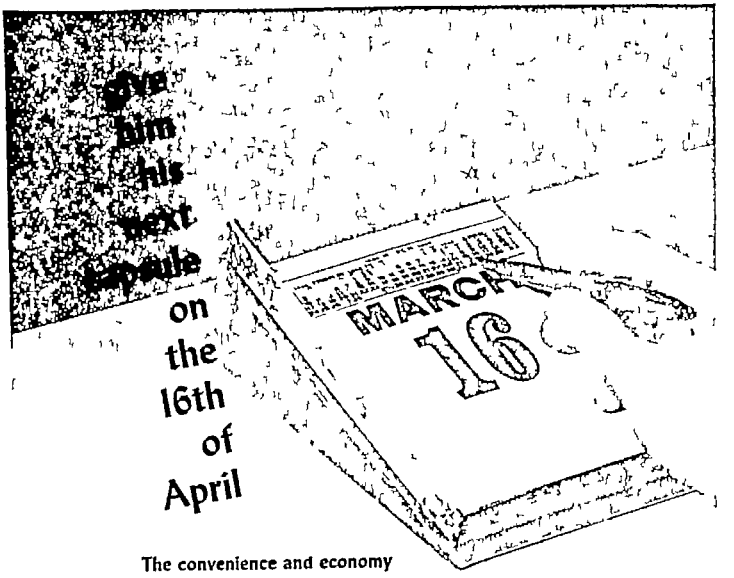
A ROERIG PREPARATION

CANDIES AND THE TREND IN *Nutrition*

SOME few kinds of candy confine their contribution to rapidly available energy. But the majority of candies now marketed and consumed in the United States are really complex confections In their manufacture many basic food substances are employed—milk, cream, butter, eggs, fruits, nuts, peanuts.

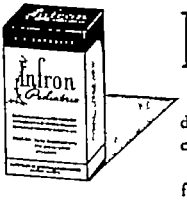
The trend in nutrition is for the use of good quality natural foods in the dietary and inclusion of these in candy helps follow this trend.

Such candies therefore make their appropriate contribution, small as it may be, of good protein, rapidly available carbohydrate, fat, vitamins, and minerals



THE NUTRITIONAL PLATFORM OF CANDY

1. Candies in general supply high caloric value in small bulk.
2 Sugar supplied by candy requires little digestive effort to yield available energy
3 Those candies, in the manufacture of which milk, butter, eggs, fruits, nuts, or peanuts are used, to *this* extent also—
   (a) provide biologically adequate proteins and fats rich in the unsaturated fatty acids;
   (b) present appreciable amounts of the important minerals calcium, phosphorus, and iron;
   (c) contribute the niacin, and the small amounts of thiamine and riboflavin, contained in these ingredients
4. Candies are of high satiety value; eaten after meals, they contribute to the sense of satisfaction and well-being a meal should bring; eaten in moderation between meals, they stave off hunger
5 Candy is more than a mere source of nutriment—it is a morale builder, a contribution to the joy of living
6. Candy is unique among all foods in that it shows relatively less tendency to undergo spoilage, chemical or bacterial



This Platform is Acceptable for Advertising in the Publications of the American Medical Association

COUNCIL ON CANDY OF THE NATIONAL CONFECTIONERS' ASSOCIATION

1 NORTH LA SALLE STREET
CHICAGO 2, ILLINOIS

The convenience and economy of once-a month dosage—for prophylaxis against and treatment of rickets—cannot be over-emphasized.

Infron

Pediatric provides effective antirachitic protection during the critical periods of infancy, childhood and prepubescency through the administration of *only one capsule each month*

Infron Pediatric is readily miscible in the infant's feeding formula, milk, fruit juices, or water, and can also be spread on cereal. Each capsule contains 100 000 U. S. P. Units of vitamin D—Whittier Process—especially prepared for pediatric use.

Infron Pediatric is clinically effective as shown in the published work of Wolf, Rambar, Hardy and Fishbein.

Supplied in packages of 6 capsules—sufficient dosage for 6 months. Available at prescription pharmacies.

Infron is the registered trade mark of Nutrition Research Laboratories

Let your HEAD take you

(The average American today has a choice of just going where "his feet take him", or choosing wisely the course to follow Let's skip ahead 10 years, and take a look at John Jones—and listen to him .)

"SOMETIMES I feel so good it almost scares me.

"This house—I wouldn't swap a shingle off its roof for any other house on earth This little valley, with the pond down in the hollow at the back, is the spot I like best in all the world.

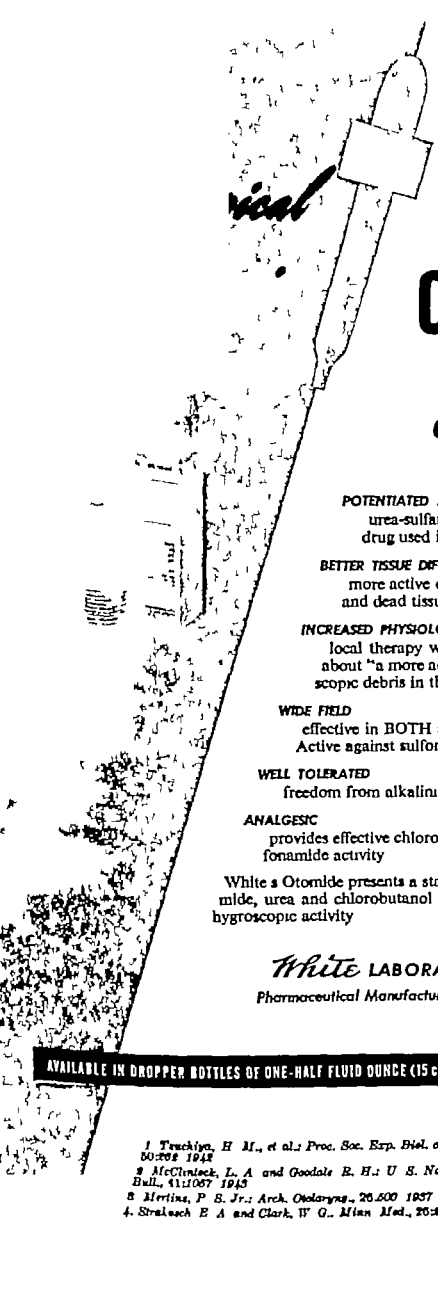
"And they're mine. I own 'em Nobody can take 'em away from me.

"I've got a little money coming in, regularly Not much—but enough. And I tell you, when you can go to bed every night with nothing on your mind except the fun you're going to have tomorrow—that's as near Heaven as man gets on this earth!

"It wasn't always so.

"Back in '46—that was right after the war and sometimes the going wasn't too easy—I needed cash. Taxes were tough, and then Ellen got sick. Like almost everybody else, I was buying Bonds through the Payroll Plan—and I figured on cashing some of them in But sick as she was, it was Ellen who talked me out of it.

" 'Don't do it, John!' she said '*Please* don't! For the first time in our lives, we're really saving money It's *wonderful* to know that every single payday we have *more* money put aside! John, if we can only keep up this saving, think what it can mean! Maybe someday you won't have to work. Maybe we can own a home. And oh, how good it would feel to know that we need never worry about money when we're old!'



"Well, even after she got better, I stayed away from the weekly poker game—quit dropping a little cash at the hot spots now and then—gave up some of the things a man feels he has a right to We didn't have as much fun for a while but we paid our taxes and the doctor and—we didn't touch the Bonds.

"What's more, we kept right on putting our extra cash into U S Savings Bonds And the pay-off is making the world a pretty swell place today!"

White's OTOMIDE

offers these unique clinical advantages

POTENTIATED ANTIBACTERIAL POTENCY
urea-sulfanilamide mixture more effective than either drug used independently [1] Not inhibited by pus.

BETTER TISSUE DIFFUSION
more active diffusion of sulfanilamide through living and dead tissues due to urea content [2]

INCREASED PHYSIOLOGIC DEBRIDEMENT
local therapy with urea in chronic otitis media brings about "a more adequate removal of the gross and microscopic debris in the recesses of the middle ear" [3]

WIDE FIELD
effective in BOTH acute AND chronic otologic infections. Active against sulfonamide resistant bacteria [4]

WELL TOLERATED
freedom from alkalinity virtually obviates local irritation.

ANALGESIC
provides effective chlorobutanol analgesia without impaired sulfonamide activity

White s Otomide presents a stable, non-irritating solution of sulfanilamide, urea and chlorobutanol in a glycerin vehicle of unusually high hygroscopic activity

So Many owe so much to----------

Blood cells from pernicious anemia patient in state of relapse

Blood cells after adequate therapy

Liver feeding has already given 19 years of life to many pernicious anemia patients who in 1926 were facing certain death

Because of the insight and labor of such men as Minot, Murphy, Castle and Cohn, there is material to replace the deficient hematopoietic principle, thus, this condition can now be treated successfully.

Purified Solution of Liver-Breon, a uniform, dependable solution, standardized on man, is released for general use only when the hematopoiesis of pernicious anemia patients in relapse has responded to its injection under conditions specified by the Anti-Anemia Preparations Advisory Board of the U S P The efficiency and economy of Purified Solution of Liver-Breon is suggested in the fact that when injected, material derived from but 1/30 as much liver need be given as when administered by mouth

Supplied:

15 U S P (Injectable) Units per cc in 10 cc vials.

10 U S P (Injectable) Units per cc in 10 cc vials and 30 cc vials

5 U S P (Injectable) Units per cc in 10 cc vials.

Extinguish the Pillars of Fire . . .

Fed by psychosomatic "fuel" in the form of hypersecretion vagus irritation and intestinal spasticity many cases of hyperkinetic intestinal disease may often be effectively "quenched" by Lusyn — newly created in the research laboratories of The Maltbie Chemical Company to satisfy the most modern concepts of rational therapy in spastic gastro-enteropathies and hyperchlorhydria with least disturbance of physiologic processes. • At once *antispasmodic* (by virtue of its homatropine methylbromide content) *adsorbent* (through the alukalin component) and *sedative* (because of the phenobarbital incorporated) Lusyn brings prompt relief yet is non narcotic and will not produce secondary acid rebound • *Indicated* in the treatment of hydrospasm—cardiospasm—unstable colon—biliary dyskinesia—biliary colic—and as an adjunct in the management of peptic ulcer *Supplied* in bottles of 100 tablets each.

A New APPROACH TO MYOPATHIES

Basic Relief of

MYOSITIS
FIBROSITIS
FIBROMYOSITIS
AND KINDRED CONDITIONS

A NEW RATIONALE, quite different from the previous approach with rubefacients and counterirritants, places Myopone therapy in a field by itself.

Formulated to the new concept that myopathies are etiologically of local metabolic origin, topically applied Myopone apparently supplies a deficiency in affected muscular tissue Utilization of the special solvent-extracted wheat germ oil contained in Myopone puts into action not only essential vitamin E but also phospholipids and other therapeutically active factors*.

FORMULA: Solvent-extracted wheat germ oil in a special absorption base

Topical application of Myopone Ointment relieves soreness, eases tension, reduces swelling and stiffness.

Available in 1 oz. and 1 lb jars at ethical pharmacies

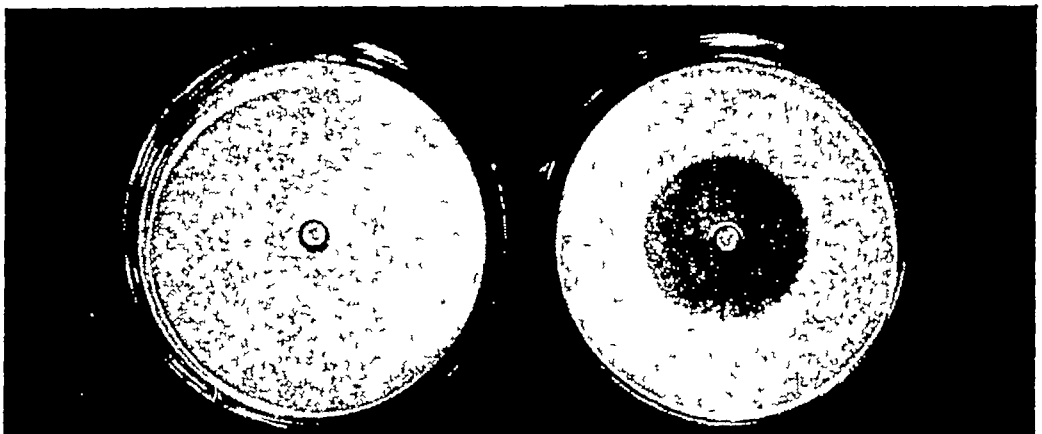
A firm position in the therapy of rheumatoid arthritis

Gold has proved its worth during the fifteen years it has been used for rheumatoid arthritis and today, holds a firm position among chemotherapeutic drugs Clinical reports indicate that improvement may be expected in eighty per cent or more of patients receiving adequate amounts of gold

SOLGANAL-B OLEOSUM

SOLGANAL-B OLEOSUM is a special preparation of organic gold, aurothioglucose It is water soluble, but suspended in oil to prolong its absorption and enhance its safety Being an *organic* gold compound, SOLGANAL-B OLEOSUM is less toxic than the *inorganic* gold salts and yet equally efficient.



SOLGANAL-B OLEOSUM (aurothioglucose, $C_6H_{11}O_5SAu$) containing approximately 50 per cent gold, is administered by intramuscular injection in repeated courses with intervening rest periods It is available in several strengths to permit flexibility of dosage

The Medical Research Division welcomes inquiries and will supply literature on SOLGANAL-B OLEOSUM dealing with its manner of use, dosage, precaution and toxicity

Trade-Mark SOLGANAL-B OLEOSUM—Reg. U S Pat. Off

Schering CORPORATION BLOOMFIELD N J

24-hour cultures. *Left*—Sterile water in cup; *Right*—Phe-Mer-Nite in cup. Phe-Mer-Nite dilutions of 1:125,000 to 1:1,000,000 inhibit the growth of streptococci, staphylococci, B. coli, B. typhosus, etc. Dilutions of 1:12,500 to 1:37,500 destroy spore-formers such as B. welchii, B. tetani, and B. chauvei.

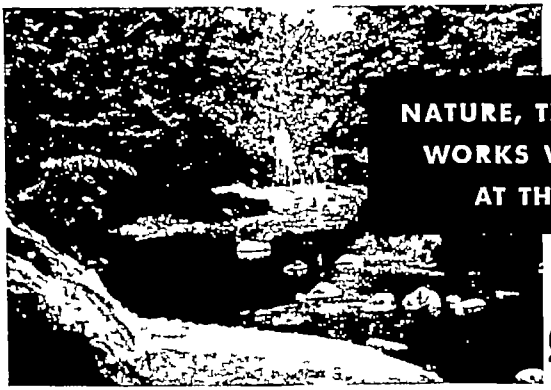
High Bactericidal Power - Minimal Tissue Toxicity

Phe-Mer-Nite is powerfully bactericidal and fungicidal, yet nonirritating and harmless to tissue in the recommended dilutions It does not hemolyze red blood cells, does not precipitate tissue proteins, has no offensive odor, does not stain It maintains its bactericidal and fungicidal powers in the presence of blood, pus or exudates It is stable to light and high temperatures, long standing does not reduce its potency

Both on intact surfaces and in open wounds, Phe-Mer-Nite fulfills every need for dependable antisepsis It may be applied to burns or other lesions requiring antisepsis, and is useful as a douche, nasal spray, gargle, and for the sterilization of instruments and rubber gloves Phe-Mer-Nite is particularly useful in the treatment of ringworm infestations

PHE-MER-NITE PREPARATIONS

Phe-Mer-Nite, a brand of phenylmercuric nitrate, is an organic salt of mercury of low toxicity and high germicidal power



Available as a tincture, solution, in cholesterinized or greaseless base, in throat tablets, and in foot powder

NATURE, THE HEALER, WORKS WONDERS AT THE SPA

The superb man made facilities at the Saratoga Spa are placed in a setting of great natural beauty In this serene environment a sick person is ideally prepared for the full benefit of medical care

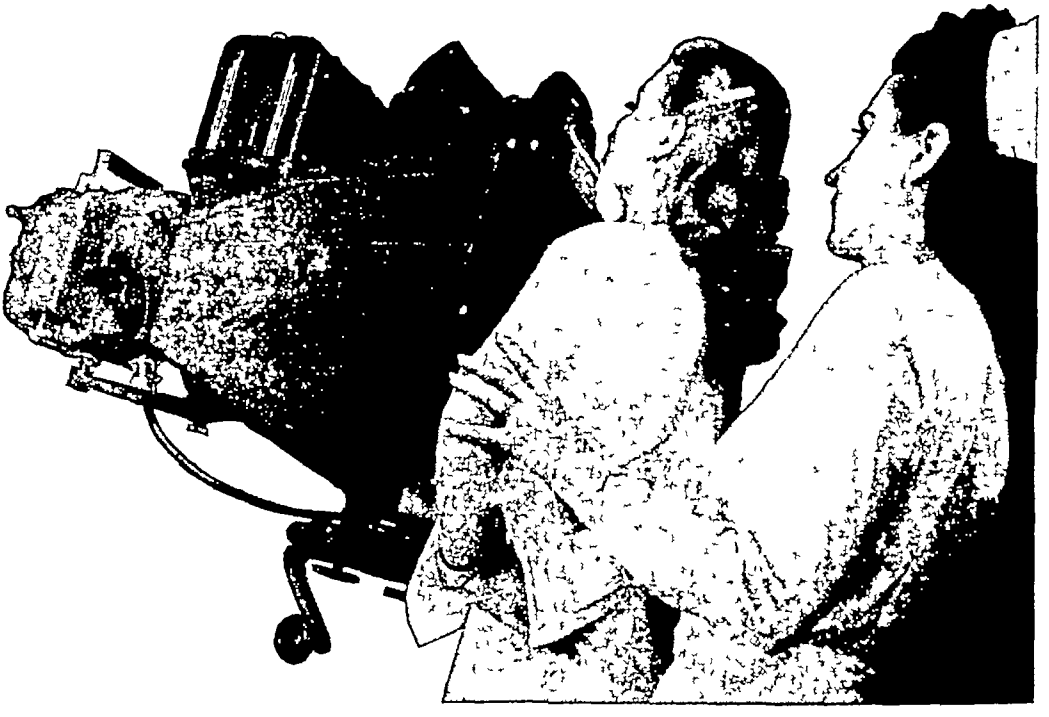
Here your patient is relaxed in both mind and body, so that the therapeutic values of the Spa's naturally carbonated mineral waters are enabled to exert their maximum efficacy

Your patient suffering from such conditions as cardiac, vascular or rheumatic disorders receives the benefit of the Spa's restorative powers under a regimen of treatment which you yourself recommend

Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

With your patient at the Spa, you find needed relief from postwar strain in the knowledge that your directions for his continuing care will be faithfully carried out

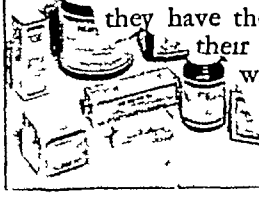
THE SARATOGA SPA



"PHYSICIAN GIVE HEED TO THINE OWN HEALTH"

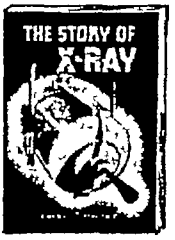
Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here After a restorative "cure" at the Spa, you too would return to your practice refreshed—revitalized—ready for the busy days that still lie ahead.

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION



For professional publications of the Spa, and physician's sample carton of the bottled waters, with their analyses, please write W S. McClellan, M.D. Medical Director Saratoga Spa, 155 Saratoga Springs, N Y.

Is Your Community Awaiting an X-Ray Chest Survey?



Through well-directed educational campaigns sponsored by tuberculosis organizations throughout the nation, men, women, and children have been learning about technological developments which today make it economically feasible to conduct x-ray chest examintaions of large groups of people for the purpose of detecting unsuspected tubercular infections in apparently healthy individuals

Public interest having been so thoroughly
sed, many communities have adopted
idually planned x-ray chest survey
ms as a most effective measure for
losis control—for screening out and
individuals who, "ignorant of the
they have the disease, unknow-
their own lives and the
whom they come in

THE COMPLETE APPROACH TO HABITUAL CONSTIPATION

Although many substances are available for promoting bowel evacuation, they cannot be regarded as corrective agents in habitual constipation. Most cathartics act solely upon the lower colon, temporarily relieving fecal stasis or accumulation without overcoming the disturbed physiologic mechanisms involved in constipation.

Cholmodin

containing deoxycholic acid (1½ gr.) and extract of aloes (¾ gr.) — exerts its stimulating action upon the *entire* intestinal tract. Deoxycholic acid, a normal constituent of human bile, promotes peristaltic activity in the small intestine, and aids in the digestion of fat as well. Extract of aloes is promptly hydrolyzed under the influence of deoxycholic acid, and promptly exerts a continuous but moderate action upon the colon. Thus the entire tract is activated, producing evacuations of normal consistency without discomfort or undue water loss. Cholmodin is especially advantageous in habitual constipation encountered in elderly and bedridden patients, when re-education of the gastro-intestinal tract is required. It is also an excellent cathartic for occasional use.

Available through all pharmacies in bottles of 50 tablets.

BODY MECHANICS OF PREGNANCY

STUDIES FROM LIFE MODELS DURING PREGNANCY • Illustration by Charlotte S Holt

4 LUNAR MONTHS 7 LUNAR MONTHS 10 LUNAR MONTHS

The postural changes during pregnancy are due to the compensatory backward shift of the center of gravity caused by forward pull of the load of the pregnant uterus.

Note the retracted shoulders, carriage of head (pride of pregnancy), and the accentuation of the natural lumbar lordosis which relieves abnormal tension on back and leg muscles.

Camp Supports aid in reducing this forward traction and assist the mother in maintaining better balance

HEPATINIC

Two factors function in chronic infections to produce the usually concomitant hypochromic anemia—

(a) Increased destruction or increased utilization of red cells due to the infection

(b) Impaired intake or utilization of diet.

Consequently one phase of medical management of chronic infections includes eradication of the coexisting anemia. Hepatinic presents iron in preferred form, together with crude (unfractionated) liver concentrate, enhanced by the addition of the B complex. The crude (unfractionated) liver concentrate is subjected in manufacture to a special process of enzymatic digestion", assuring maximum assimilation

Taste Appeal!

Taste is important in hemopoietic tonics. Hepatinic—pleasantly palatable—is readily accepted even by finicky taste-conscious patients. Samples will be sent to physicians on request

FORMULA:

Each fluidounce contains Ferrous Sulfate 12 gr. Crude Liver Concentrate (equivalent to 660 gr. fresh liver) 60 gr., fortified to represent Thiamine Hydrochloride 2 mg. Riboflavin 4 mg. Niacinamide 20 mg. together with pyridoxine, pantothenic acid, choline, folic acid, vitamin B_{10}, vitamin B_{11}, biotin, inositol, para-amino-benzoic acid and other factors of the vitamin B complex.

Elixir Hepatinic is supplied in bottles of one pint and one gallon

No food (except breast milk) is more highly regarded than Similac for feeding the very young, small twins, prematures, or infants who have suffered a digestive upset. Similac is satisfactory in these special cases simply because it *resembles breast milk so closely*, and normal babies thrive on it for the same reason. This similarity to breast milk is definitely desirable — *from birth until weaning*

A powdered modified milk product especially prepared for infant feeding made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil coconut oil, corn oil and cod liver oil concentrate.

One level tablespoon of Similac powder added to *two* ounces of water makes *two* fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

ERYTHROL TETRANITRATE MERCK in Angina Pectoris

It is generally agreed that the acute attack of anginal pain is most readily relieved by the prompt removal of the provocative factor and by the use of nitrites. For this purpose, the rapidly acting nitrous and nitric acid esters, amyl nitrite and nitroglycerin, are considered most useful

For prophylactic purposes—to control anticipated paroxysms—the *delayed but prolonged action* of erythrol tetranitrate is more effective Erythrol tetranitrate, because of its slower *and more prolonged action*, is also considered preferable for the purpose of preventing nocturnal attacks.

The vasodilatation produced by Erythrol Tetranitrate Merck begins 15 to 20 minutes after administration, and lasts from 3 to 4 hours.

The properly timed administration of a vasodilator having a sustained effect may prevent the following episodes of angina pectoris:

- The man who finds it necessary to stop and rest when he walks to the train in the morning
- The man who suffers "indigestion" and "gas" on exertion, or after a heavy meal.
- The man who has pain in his chest and arms, and weakness upon any anxiety, anger, or nervous strain.

Editorial

The Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held this year at the Hotel Pennsylvania, New York City, April 29 to May 3 It will be the first full assembly with scientific sessions and meeting of the House of Delegates since V-J Day

We urge that all members of the Society plan to attend. It will be the first available opportunity to greet old friends returned from duty with the armed forces, to view the latest developments in new instruments, methods of treatment, and to attend the general and special sessions

At the General Session the principal attraction will be Dr Alfred Blalock, professor of surgery at Johns Hopkins University Medical School, who will speak on "The Surgical Treatment of Congenital Pulmonary Stenosis" He will present a motion picture as well as his address. His paper will be one of four on vascular diseases scheduled for the afternoon of May 3, the others being by Dr Hinton on the surgical treatment of hypertension, and by Drs. Irving Wright and Gerald Pratt, discussing the management of phlebothrombosis

At the Wednesday meeting of the General Session there will be a paper by Dr Alvan Barach on "Penicillin Aerosol with Special Reference to its Use with Intermittent Pressure in the Treatment of Sinusitis." Not too much has been written on this method of administering penicillin, and Dr Barach has apparently employed it successfully in bronchopulmonary infections as well as in sinusitis. He will have a scientific exhibit as well. Dr Arthur DeGraff, of New York University, will also be a speaker on the "Clinical Comparison of the Cardiac Glycosides."

Medicine and surgery will meet as a group at one of their Sessions and discuss nutritional problems in the surgical patient

This year, for the first time, the History of Medicine Section will be held in the evening and will be open to laymen as well as doctors.

This meeting will also welcome the Chest Section.

This, in general outline, is the preview of the Annual Meeting based upon available information at the moment. More details will be published as final plans are completed. The JOURNAL urges all members to set aside now the time for attendance at the meeting and to write for reservations at the earliest possible time, since hotel accommodations are still limited in New York City

Federal Medicine?

If any one *still* thinks that it would be a good idea to have Federal control or Federal management of the affairs of medicine, now is a truly excellent time for such a one to cast an eye about, to incline the ear, and to survey the scene of American life as it is being currently directed from above

Would anyone in even partial possession of his senses care to see the institutions and practice of medicine under the control and direction of such persons as are currently capering, sounding off, filibustering, and "politicking" about the national Capitol? A sad picture

Perhaps it made sense to fiddle while Rome burned in Nero's time We wouldn't know But at that time there was no question of the Federal control and direction of medicine

Since then, however, a serious, scientific, and responsible profession has builded upon the foundations laid down by Hippocrates and Galen an institution and practice of medicine unreservedly and unqualifiedly dedicated to the sole interest of the sick, to the promotion of the public health, and now to the advancement of preventive medicine

The very foundations of such a structure are facts and scientific experiment to develop and uncover more facts, to create better public health, more effective preventive measures

It should be apparent to anyone who has watched and followed the blundering, red-tape-ridden and logorrheic attempts of the Federal government to supervise the current food, housing, transportation, and production muddle that here is no agency to be trusted with direction of the affairs of medicine. To go no deeper into the question Why should such a blundering government undertake to muddle up something *more* when it cannot now even unmuddle the things it is supposed to know and do something about?

Consider the picture Shortages of nearly everything but oratory Whole cities at times without fuel, basic communications systems tied up, national labor relations deteriorating in indecision, ineffectiveness, and appeasement for political purposes, insufficient housing, little fuel for existing homes—to mention only a few of the things which might be enumerated

Is this a government on the record, to be entrusted with the affairs of sick people as the Wagner-Murray-Dingell bill proposes? A government that cannot or at least does not assure to well people even the basic necessities for living?

The picture is different if the objective sought is to bring all living standards down to the level of the lowest common denominator of a bare, cold, cheerless, and haphazard existence Then, perhaps, it would be at least consistent that even the sick should be subjected to the same measure of inefficiency, wants, lacks, and deprivations as the well must now endure

The picture is too dismal to contemplate A government apparently too much concerned with its own perpetuation, seemingly reluctant to secure the welfare of the whole people against the baronial raids of stubborn organized minorities, indecisive, hesitant, does not seem to us qualified by virtue of these characteristics to be the ideal mentor of medicine and guardian of the sick

National Service Life Insurance

To those medical officers who are returning to civilian practice there may arise the temptation to drop or allow to lapse their National Service Life Insurance We urge that no consideration be permitted to interfere or to contribute to such folly

Premium rates on National Service Life Insurance are exceptionally low The Government pays all operating expenses, and assumes excess mortality due to military action Dividends will probably be paid in future years which will reduce the cost of the protection

Included without extra cost is a valuable provision for waiver of payment of premiums during continuous total disability

for six or more consecutive months on account of "any impairment of mind or body which continuously renders it impossible for the insured to follow any substantially gainful occupation"

If you allow your policy to lapse, you may be unable, later on, to pass a physical examination for new life insurance. If you have been physically impaired by war service, it is especially important to keep this point in mind.

Settlement provisions on your National Service policy are unusually favorable for the beneficiary Although lump-sum payments are not now available, the Government may later permit at least a part of the proceeds to be paid in cash. The payments to your dependents may be increased by Social Security benefits and possibly by a Government pension

By keeping the low-cost protection you now have, you guard against the danger that you may fail, through inertia, to obtain the insurance you will need at some future time

Don't give up your Government insurance. If anyone advises you to do so, have him give you his reasons in writing If you have already let your Government insurance lapse, consult the nearest office of the Veterans Administration about reinstating it

After your discharge, you should forward to the Collections Subdivision, Veterans Administration, Washington 25, D C, within thirty-one days from the end of the period for which premiums were last paid, a remittance for the amount of the premium Thereafter, continue your direct payments each month (or on the due dates if you have arranged to pay quarterly, semiannually, or annually)

Within eight years of the date you took out your original policy, you may convert all or part of it into straight life, twenty-payment life, or thirty-payment life. Rates are exceptionally low because the Government will continue to pay all operating expenses. No physical examination is required Application should be made on insurance form 358, available from the Veterans Administration

Do not be in a hurry to convert Allow enough time to find out what your earning power and expenses as a civilian will be

If you find it difficult to maintain the full face value of your insurance at the increased premium rates following conversion, remember that you can reduce the amount to $1,000 or any larger total that is a multiple of $500 Such application should be made by letter, addressed to the Veterans Administration, Washington 25, D C, signed by you and stating the exact amount to be continued in force

We cannot too strongly urge that all veteran medical officers maintain in force, at whatever sacrifice, as much of their National Service Life Insurance as possible To those who already may have allowed their policies to lapse we advise immediate consultation with the nearest office of the Veterans Administration Do not let indifference, carelessness, or forgetfulness deprive you of a valuable asset and your family of the best life-insurance protection at the lowest cost you can ever obtain.

Do it *now*

Early Rising after Childbirth

It had become accepted practice in this as well as many other countries to keep women in bed for at least from nine to twelve days, even after normal labor But now that dictum is being changed and the change has been accelerated by war conditions, for the demand on hospital maternity beds has compelled the earlier discharge of patients to make room for others Apparently, judging by reports emanating from various observers, the practice has been of benefit and has not done any harm. Notwithstanding these favorable reports it will take some time to change accepted customs and individual discrimination must still be exercised in the individual case.

Consideration must be given to the hitherto prevailing objections Doctors will have a fear of medicolegal consequences, that perineal wounds would break down, that prolapse and retroversion would be more likely, that postpartum bleeding would be excessive, and that the patient would not approve As for the patients, the procedure

was unfamiliar and they doubted whether it was good, believing that they needed rest after the efforts of labor and were too weak to walk, and that their "stitches would not heal." But physicians who favored early ambulation found these objections more theoretic than actual and apparently have proved their point by statistical evidence For example, Rosenblum, Melnkoff, and Fist, at the Cedars of Lebanon Hospital, in Los Angeles, have recently presented (*J A M A.*, Nov 24, 1945) their observations made on a consecutive series of 229 unselected patients who were kept in bed more than five days and were used as controls for a series of 247 patients who were allowed up and about on their first and second postpartum days In all of these women there were no changes made in delivery or operative technic All of the patients with vaginal deliveries were kept in the hospital from six to eight days, while those who had cesarean deliveries were kept in from eight to twelve days Only 12 patients stayed a few days beyond these limits because of minor complications

These constitute very interesting data and the conclusions are supported in similar reports from other sources Early rising would mean less nursing care Bowel and bladder functions are more quickly restored, convalescence more quickly restored, with less asthenia and less postoperative and postpartum depression

By the adoption of these departures from accepted custom, there is indicated a return to first principles, to the stories of the peasant women who gave birth to their babies in the fields and then resumed their labors It may not all be so simple at the present time with our more complicated civilization and in the face of the teaching for adequate antepartum and proper labor care

These principles necessarily must remain in force and the propaganda for early rising should not serve to develop a laissez faire attitude toward pregnancy itself The latter still calls for responsibility from both the prospective parents and the doctor In every case of labor individual discretion must continue to be exercised

Current Editorial Comment

Of This and That

Phobias in Aviation Pilots. Shortly, civilian physicians will encounter as patients many of the young men who have been trained as pilots The knowledge of the occurrence and the genesis of phobias in these young men may be of assistance [1]

"Phobias are known to all psychiatrists and most other medical men as specific fears As a plurality, and with separate Greek-sounding names to denote each individual phobia, they have been regarded largely as separate entities of mental disorder, and it has been this conception which primarily determined the trend of study The effort brought few results of importance, as it is now known that the phobia is only a surface manifestation of an underlying anxiety, or, as will be shown from the study of pilots, it may act in the place of a conflict or problem, and its repetition in thinking may keep the individual from worrying about the original painful idea

"The tendency for obsessive-compulsive states to appear in adolescence and gradually progress constitutes another differentiating characteristic, phobias may appear at any period in life and after a varying course disappear entirely Recent writers are insistent that all phobias, except the phobias of early childhood, are merely manifestations of anxiety states

"In any consideration of phobias a technical distinction should be made between types of common fears and morbid fears Almost everyone has a fear of illness, death, or snakes, but only the mentally ill have any great fear of open spaces, heights, or closed spaces

"The object of this paper is to demonstrate the nature of various phobias as they occur in pilots so that they may be recognized early and adequate psychiatric treatment instituted Furthermore, it will emphasize the importance of studying the more serious and far-reaching personality disorder which may be present Otherwise the phobia alone, or the phobia and a complex personality disorder, may incapacitate the pilot for flying

"One of the primary instincts in the newborn is

[1] Davis, David B , Mil. Surg , p 105 (Aug) 1945

a fear of falling, a fear that usually remains with the individual throughout life. This basic fear is one of the pilot's most important psychological problems Much has been done to improve safety measures designed to help overcome this specific fear Mechanical parts of planes have been gradually improved, fliers have been instructed repeatedly regarding safety measures, and it is well known that parachutes are being studied constantly for the purpose of increasing safety

"Most pilots flying within the United States have developed such a sense of security because of the wearing of the modern parachute that they have little fear of having to 'bail out.' They feel that if it is necessary to leave the plane and float to earth in a parachute they will land in comparative safety and soon be found"

Four cases are cited and treatment outlined The author concludes,

"1 The importance of recognizing phobias in the various complaints of pilots has been stressed.

"2 Phobias are usually associated with an underlying and moderately severe anxiety state and at other times are the most apparent findings of a more far-reaching personality disorder such as of psychosis

"3 In the major number of cases phobias act as psychologic protective mechanisms.

"4. The early recognition of these problems in pilots will permit early treatment and prevent the pilots being grounded for indefinite periods of time.

"5 All phobias thus far observed in the A.A.F have been connected with specific situations."

Federal Support of Scientific Research. In view of the wide interest shown by the introduction of several congressional measures, the following report by the Committee on Public Health Relations of the New York Academy of Medicine, is worthy of note This was presented by the President of the Academy at the hearings held in Washington and is as follows

In the considered judgment of the Committee on Public Health Relations of the New York Academy of Medicine the following general principles should govern proposals to enlarge the area of financial participation by government in scientific research work.

1 Support of research in medicine and public health by federal funds is necessary and desirable.

2 Such support should be supplementary to that from private sources. It should not aim to supersede, diminish, or discourage private support.

3 The primary function of the proposed National Research Foundation should be to develop and finance and not to operate or control research activities. The paramount importance of fellowships and scholarships in the field of medicine and public health should be stressed

4 The activities of the proposed Foundation should not be construed as supplanting the scientific work which is being carried on by certain branches of the Federal government

5 Freedom of the individual worker and of the participating institutions should be assured through proper safeguards.

The Committee is somewhat apprehensive lest the present tendency to emphasize combined or group research may jeopardize initiative and opportunities for individual creative expression The position of those engaged in research without an immediate and practical objective may become insecure. Therefore, it is recommended that the policy pursued be clearly formulated to insure the availability of support both for combined or group research and for independent research by individuals

6 The governing authority of the proposed National Research Foundation should be vested in a board appointed by the President of the United States. Its functions should be similar to a board of trustees of an educational or benevolent organization There should be no ex officio members on such a board The board should have the sole authority and responsibility for the determination of policy The executive officer of such a Foundation should not be a member of the board, and his functions should be to carry out the policies of the board

Of all the pending bills which deal with government support of scientific research the Magnuson bill comes nearer than any other to being in accord with the above principles The following changes, however, are suggested

1 The Magnuson bill provides that a National Research Foundation be established "to develop and promote a national board for scientific research and scientific education" (Sec 2a) and "to initiate and support basic scientific research and scientific development in the medical, natural, and social sciences through contracts grants, or other forms of assistance" (Sec. 2b)

The above subsections should be modified in order to clarify the primary purpose of the Foundation, which is to support and integrate rather than to initiate or operate research. Substitution of the word "develop" for the word

"initiate" would eliminate the implied domination of scientific research by the Foundation

2 Another purpose of the bill is "to discover and develop scientific talent, particularly in American youth" (Sec 2d) In the judgment of the Committee it is not the task of the Foundation to make discoveries of scientific talent, such discoveries should be left to educational agencies It is suggested that the phrase "to discover and develop" should be changed to read "to encourage scientific talent by adequate grants"

3 The Foundation is also "to foster the interchange of scientific information among scientists in this country and abroad, and to correlate the Foundation's scientific research and scientific development programs with those undertaken by public and private research groups" (Sec 2f, g) The Committee is of the opinion that Sections 2f and g should be reworded so that a possessive spirit on the part of the Foundation will not be implied

The following phraseology is preferred "To foster the interchange of scientific information among scientists in this country and abroad, and to correlate the scientific research and scientific development programs *sponsored by the Foundation* with those undertaken by public and private research groups"

4 The Magnuson bill provides for the establishment of "a National Science Reserve" in which those who receive scholarships and fellowships in science and medicine from the Foundation shall be available for call into the service of the government for scientific and technical work in time of war or other national emergency (Sec 7i) The Committee does not consider this provision necessary or desirable, since the Congress has the power to draft all men in time of war and since the provision makes the scholarships and fellowships conditional rather than free grants made solely in the interests of scientific research

5 In the judgment of the Committee close liaison should be maintained between the Division of Medical Research and the Division of Scientific Personnel and Education with regard to the granting of fellowships and scholarships (Sec 5a)

6 For purposes of clarity the Section which provides that the members of the committees within each division "shall be appointed by the Board *after receiving* recommendations from the National Academy of Sciences" (Sec 6a) should be changed to read that the members "shall be appointed by the Board *upon* the recommendation of the National Academy of Sciences"

1946 House of Delagates

The regular annual meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10 00 A M on Monday, April 29, 1946, in the Keystone Room, Balcony Floor of the Hotel Pennsylvania, New York City

In accordance with Chapter II, Section 3, of the revised Bylaws, the House will assemble according to the following schedule

Monday, April 29, 1946, 10 00 A M
Tuesday, April 30, 1946, 9 00 A M and 2 00 P M
Wednesday, May 1, 1946, 9 00 A M

At the last adjourned session (9 00 A M , Wednesday, May 1) the election of officers, councilors, trustees, and delegates will occur in accordance with Chapter III, Section 1, of the revised Bylaws

It will be noted that the House will meet this year on three days instead of two, to permit more time for the Reference Committees to work and make it unnecessary for the members of the Committees to be absent during the sessions of the House To avoid further conflict, the section meetings will not start until Wednesday morning instead of Tuesday morning as heretofore, and the Annual Dinner will be held Wednesday evening instead of Tuesday evening

COMMUNITY ASPECTS OF VENEREAL-DISEASE CONTROL IN HARLEM

GERALD A SPENCER, M D , and ROGER F GORDON, New York City

NOWHERE in all the world is there a better known community than New York's Harlem With a larger population than the total population of Louisville, Minneapolis, New Orleans, Cincinnati, or each of six states of the union, its infectious laughter, its gay nightlife, its picturesque language distortions and modes of dress, its characters, real and legendary, its educational facilities, its sociologic assets and liabilities have been the subjects of reams of studies descriptions, surveys, and caricatures

Unfortunately, that colorful Harlem has been more vividly described and more widely read of than the Harlem of economic handicaps and dreaded diseases In the latter is an appallingly high venereal-disease rate

The Problem

Representing 11 per cent of the Manhattan population, Harlem has by disease, 33 per cent of all cases of syphilis, and 44 per cent of all cases of gonorrhea, by age groups, 57 6 per cent of all infection in teen-age girls, and 45 4 per cent of all infection in teen-age boys

Similar disparities continue up through all ages.[1]

Selective Service reveals venereal disease rates that are ten times higher in negro men than in white men This situation exists on a nation wide basis

TABLE 1.—POSITIVE SEROLOGIC TESTS FOR SYPHILIS[2]

Age Group	White Men Per Cent	Negro Men, Per Cent
21-25 years	1 0	10 0
26-30 years	2 1	29 4
31-35 years	3 0	35 7
Total for all ages	1 7	25 2

The venereal diseases are not peculiar to any racial group or geographic location White and black are equally susceptible, whether they live in urban or rural communities, inland, or on the seacoast In Harlem, therefore, the high incidence of venereal infection is but one of the socially undesirable by-products created by segregation and denials of opportunity, lack of employment, poor housing, limited recreational facilities, and inadequate medical services

[1] Bureau of Records and Statistics Department of Health City of New York Service and Vital Statistics, 1943. Tables # 44 V-3 and 44-V-4

[2] Smillie W G., J.A.M.A (June 5) 1943

The Harlem Council on Social Hygiene

In Harlem as elsewhere, the Negro is at the bottom of the economic and educational scales, hence his rate of syphilis and gonorrhea infection is disproportionately high

Traditionally the major educational efforts at venereal disease control in Harlem have come from three sources, viz

The Department of Health—It has provided free clinics, conducted city-wide educational campaigns, offered seminars and free medicine to physicians, and has made literature, exhibits, and films available to organizations

The New York Tuberculosis and Health Association—It has provided similar social hygiene education as an adjunct to its major focus

The American Social Hygiene Association—It offers consultation services, literature, exhibits, and studies Its campaign among druggists has achieved notable results

The attitude of each of these organizations has been cooperative, their programs well presented, yet the community's venereal disease rate continues to rise Certainly the war and its accompanying relaxation of moral standards has been a contributing factor That has been true of the entire country Nevertheless, the prewar incidence in Harlem was sufficiently alarming to point up the need for a social agency within the community to devote its full time energies to venereal-disease control As a result, in 1943 representatives of those organizations most concerned with the health of the community met and formed the Harlem Council on Social Hygiene

The aim of the Council is to inaugurate and maintain a venereal-disease control program of community organizations and community education representing all types of groups It operates under the direction of the paid staff and is divided into Health Education, Medical Care, and Social Protection sections

The Sections of the Council

1 Health Education—The purpose of this section is twofold first, to stimulate public understanding and support of social hygiene as a permanent community activity, second, to disseminate information to all age groups about sex hygiene and healthy human relationships, with particular emphasis on the prevention, diagnosis, and treatment of venereal disease

In order to achieve these objectives the section hopes to make extensive use of all approved methods of public-health education, utilizing whatever materials are already available through other sources, and supplementing them with additional material to be produced by the Council as the need arises Such media will include motion pictures, both for theater use and for showing before special audiences, pamphlets, posters, and exhibits, both stationary and mobile, newspaper campaigns, carefully prepared courses conducted for parents, group leaders, young people, ministers, and other community groups whose understanding and cooperation are vital to the success of the effort

The Section will work closely with those who represent various community interests business firms, *trade unions*, *labor organizations*, the local chamber of commerce, churches, schools, fraternal organizations, women's clubs, housewives' leagues, young people's groups, social and athletic clubs, sororities and fraternities, social, health, and group-work agencies, medical, nursing, dental, and pharmaceutic organizations, hospitals, and health-department clinics

Concerned as it is with the problem of reaching as many individuals as possible through every available point of contact, the working committee of the Section on Health Education is made up of people from as many walks of life as possible Its membership includes members of health and welfare agencies, both public and private, of youth-serving organizations, doctors, ministers, educators, labor leaders, representatives from fraternal and benevolent societies, and lay leaders It is literally a "total community effort"

2 Medical Care—The Medical Care Section was established with four objectives in mind (1) to promote the cooperation of all community groups in order to locate sources of infection more effectively, (2) to seek constant improvement of clinical services as indicated by the needs of the community, (3) to provide additional opportunities for physicians for observation and demonstration of recent advances in the diagnosis and treatment of venereal disease, and (4) to aid in the publication of research findings in the area of venereal-disease control

The Section will work toward these goals by offering seminars and clinical demonstrations for physicians, group discussions for nurses, dentists, pharmacists, and other medical technicians to broaden their knowledge of existing facilities for treatment, and to persuade them of the necessity for immediate referral The Section will also undertake to make surveys and studies at periodic intervals to check on the effectiveness of the total campaign through statistical changes in incidence, use of treatment facilities, etc

Since it deals primarily with the medical features of the Council's program, the makeup of this Section's working committee is almost entirely professional It includes doctors, hospital administrators, health officers, nurses, social workers, dentists, and pharmacists

3 Social Protection—The basic aim of the Social Protection Section is to give the community more effective protection against sexual delinquency, prostitution, quackery, and illicit medical practices carried on through the neighborhood drug stores.

In order to do this it will (1) cooperate with law-enforcement agencies and seek to enlist widespread citizen support in the task of rooting out conditions which contribute to sex delinquency, such as unwholesome places of recreation, dance halls, pool rooms, juke-box candy stores, bars, unsupervised clubs, and movie houses, as well as the publication of obscene literature, and (2) it will work actively, together with the Section on Health Education, toward the establishment of healthy and attractive recreational opportunities and youth programs It will also encourage and support passage of additional legislation for social protection

Focused on the legal and social phases of the control program, the working committee for this Section has a strong enrollment of lawyers, judges, probation officers, and other court officials It also includes ministers, health and welfare representatives, newspaper editors, educators, and labor leaders, who will work together to eradicate the old, vicious practices and to substitute a healthier pattern

It is still virtually impossible to evaluate methods in venereal-disease education, for there exists no large reservoir of experience upon which judgments may be based It is felt, however, that most educational efforts have been lacking in three large areas First, they have failed in their attempts to have syphilis and gonorrhea discussed with the frankness that tuberculosis, smallpox, cancer, and other communicable diseases are It is believed that much can be done in this area Certainly, the usual method of venereal-disease infection is as normal and natural to human processes as are the circumstances involved in the other infections

Second, lectures, films, and literature have, for the most part, been directed at groups which need them least, i e , church, community centers, organizations of citizens who have interest in the community's best influences However, the pool

rooms, taverns, street corners, and public lavoratories are popular sources of miseducation We will take our educational program to them in their own locale, using their own language We will use book matches, posters, films, and pamphlets to stimulate discussion

Third, it is all well and good to appeal for higher moral standards, however, the sex urge is fundamental and will be with us always By the same token there will always be those who will seek promiscuous outlets Unless those persons know preventative measures and take them, there will always be a large reservoir of venereal disease The Army has faced this problem realistically, on the premises that the soldier who practices abstinence will practice it notwithstanding his knowledge of prophylactics We hope to help dissenting groups and influences in Harlem to accept a similar realism For materials we will draw upon existing resources, supplementing them with some of our original design and production [8]

Community Facilities

The Council's program will, no doubt, result in a wider use of Harlem's medical facilities for diagnosis and treatment The question of their adequacy rises. There are a sufficient number of physicians in the community Free clinics, while admittedly understaffed could accommodate many more than their present load Rapid Treatment Centers, although still in their infancy, have justified their existence In Manhattan, however, there is but one (Bellevue), far distant from Harlem, the city's largest venereal-disease-infested area. We recommend the immediate development of a Rapid Treatment Center in Harlem

Summary and Conclusions

The venereal-disease problem has outgrown the proportions of its combination with other health-education programs The inevitable result of such alliances is muting of the venereal diseases in favor of other more "socially acceptable" diseases Venereal-disease education is most acceptable when presented by those best known to groups, ideally their own members who have been carefully indoctrinated

The program of the Harlem Council on Social Hygiene embodies both of these philosophies. Our operations, at this stage of the game, indicate that we are headed in the right direction. Sustained, continuous community-education programs virtually eliminated the venereal diseases from Scandinavian countries In spite of the more heterogeneous composition of the American population, the same can be accomplished here Growing out of a community's awareness of its own problem, the Harlem Council on Social Hygiene is firing an opening volley

SOCIAL WELFARE DEPARTMENT CREATES COMMISSION FOR THE BLIND

All cases of legal blindness in New York State must be reported to the Commission for the Blind of the State Department of Social Welfare in accordance with a recent amendment to the act creating the New York State Commission for the Blind. It is now the duty of every health and social agency, attending or consulting physician or nurse to report to the State Commission for the Blind, in writing, the name, age, and residence of persons who are blind within the definition of blindness and to furnish such additional information as the Commission shall request for registration or prevention of blindness.

This law supplements the mandated responsibility of the Commission for the Blind, Section 8774, Title 24, Chapter 3, of the Unconsolidated Laws to maintain a complete register of the blind in the State of New York which shall describe the condition, cause of blindness, capacity for education, and industrial training of each

Data as required by the Commission for the Blind will further the State's effort to prevent blindness through a comprehensive knowledge of the facts relative to the causes of blindness This information will also aid in the earlier recognition and detection of cases where remedial measures for restoration of vision are still possible. Likewise, those who may desire the services of the Commission for the Blind will be benefited through acquaintance with the opportunities available to which they are entitled

Legal blindness is defined as total blindness or impaired vision of not more than 20/200 visual acuity in the better eye and for whom a diagnosis and medical findings show that vision cannot be improved to better than 20/200, or who has loss of vision due wholly or in part to impairment of field vision or to other factors which affect the usefulness of vision to a like degree.

Apparent blindness should also be reported even though not based on an eye examination

For reporting blanks, please address the Commission for the Blind, 205 East 42nd Street, New York 17, New York.

In order to achieve these objectives the section hopes to make extensive use of all approved methods of public-health education, utilizing whatever materials are already available through other sources, and supplementing them with additional material to be produced by the Council as the need arises Such media will include motion pictures, both for theater use and for showing before special audiences, pamphlets, posters, and exhibits, both stationary and mobile, newspaper campaigns, carefully prepared courses conducted for parents, group leaders, young people, ministers, and other community groups whose understanding and cooperation are vital to the success of the effort

The Section will work closely with those who represent various community interests business firms, trade unions, labor organizations, the local chamber of commerce, churches, schools, fraternal organizations, women's clubs, housewives' leagues, young people's groups, social and athletic clubs, sororities and fraternities, social, health, and group-work agencies, medical, nursing, dental, and pharmaceutic organizations, hospitals, and health-department clinics

Concerned as it is with the problem of reaching as many individuals as possible through every available point of contact, the working committee of the Section on Health Education is made up of people from as many walks of life as possible Its membership includes members of health and welfare agencies, both public and private, of youth-serving organizations, doctors, ministers, educators, labor leaders, representatives from fraternal and benevolent societies, and lay leaders It is literally a "total community effort"

TABLE 1.—Operative Procedures with Anesthetic Dosage

Operation	Number	Anesthetic Spinal 5 Per Cent Procaine	Mortality
Excision of pilonidal cyst	93	100–125 mg.	0
Hemorrhoidectomy	806	50–100 mg.	0
Excision of fistula in ano	53	75–100 mg	0
Excision of anal fissure	63	50–75 mg.	0
Total	1017		

ters Where necessary, the external sphincter was severed at more than one site at the same operation, and the severed muscle fibers were subsequently sutured together after excision of the tract. There have been no recurrences, and primary closure has brought the patient morbidity rate down to an average of three weeks The additional advantage obtained in primary closure is the prevention of the formation of a hard rigid cicatrix, which often may occur when an extensive wound in the anal and perianal soft tissues is allowed to remain open Preoperatively, the fistula is injected with an aqueous methylene-blue solution, and operation is postponed until the internal opening of the tract is definitely visualized These patients received sulfadiazine both before and after operation

Anal Fissure and Ulcer

A true anal fissure is an infection and is best treated by surgical excision The application of silver nitrate merely seals over the top of the fissure and allows the infection to remain at the bottom of the crevice In the same way, the injection of one of the procaine derivatives in oil solution gives temporary relief, but does not eradicate the infection In this series, all anal fissures and ulcers were excised down to the external sphincter and the healthy mucosal edges sutured together These results have been uniformly good, and the postoperative morbidity period has ranged between ten to fifteen days The practice of anal divulsion when performing anorectal surgery should be severely condemned Stretching the anal sphincters with consequent trauma to the muscle fibers and mucosa, can only result in postoperative edema of the tissues and accompanying pain Divulsion should not be necessary if adequate anesthesia is obtained and if good exposure of the operative field is managed Excellent relaxation has been accomplished with low spinal anesthesia (between the fourth and fifth lumbar vertebrae), using 50 to 125 mg of 5 per cent procaine solution After administration of the anesthetic the patient is placed in a prone position, the operating table is broken and the buttocks are separated by wide adhesive straps This routine has been followed in all operations, and there have been no anesthetic complications

Conclusions

1 An attempt has been made to present some of the proctologic problems encountered in a military hospital

2 It has been our experience, after a fairly large series of operative procedures, that pilonidal disease is best treated conservatively in the army If excision of the cyst and sinuses is decided upon because of repeated abscess formation recurring within a short time interval, the following technic should be observed (*a*) complete excision of the infected tissue with the minimal sacrifice of healthy surrounding tissue, (*b*) complete hemostasis and the use of fine ligature material, (*c*) primary closure of the wound without tension, (*d*) the application of a good pressure dressing

3 Hemorrhoidectomy is the method of choice in the treatment of internal hemorrhoids, and the use of cotton suture material in anal operations is recommended

4 Excision of fistula in ano with primary closure of the wound has given excellent results in this series of cases

5 Anal divulsion as part of any operative procedure around the anal canal is strongly condemned

6 Low spinal anesthesia, using 5 per cent procaine solution, has given gratifying results, because of the excellent relaxation obtained and the freedom from anesthetic complications.

Technical Exhibits

Physicians attending the Annual Meeting of the Medical Society of the State of New York April 29–May 3 are urged to visit the Technical and Scientific Exhibit Hall located in the Grand Ball Room of the Pennsylvania Hotel

PROCTOLOGIC PROBLEMS IN A MILITARY HOSPITAL

S Z Vogel, Maj ,(MC),AUS, Queens, New York

(From the Station Hospital, Camp Gordon, Augusta, Georgia)

ANORECTAL disorders are quite common in the army because of the rigors of military life It is for this reason that hemorrhoids, pilonidal disease, anal fissures, and fistulas, which usually occur in young men, have such a high rate of incidence in the armed forces

The author has, for three years, been in charge of the proctology section of the department of surgery at a large station hospital A rectal surgery ward containing thirty-three beds has been maintained, together with a rectal clinic These beds have usually been filled to capacity The clinic has been used for examining inpatients and outpatients and for carrying out minor surgical procedures From October 23, 1942 until October 22, 1945, 1,017 major anorectal operations have been performed Table 1 is presented to show the types of operations performed and the anesthetic used

Pilonidal Disease

From the beginning of this study, pilonidal cyst and sinus infection presented a difficult problem Soldiers in training could not be expected to hike and carry out their vigorous training programs while wearing a dressing, and with the limited toilet facilities present in the field, a soldier had to have complete wound healing before leaving the hospital The procedure of excising the cyst and sinuses and allowing the wound to granulate without primary closure gave a high patient morbidity extending over four to six months Obviously, with the acute manpower shortage then existing, this was too much of a time lag Therefore, a procedure was sought which would eradicate the cyst and allow for primary closure of the wound Various methods, including the flap incisions, the "sliding graft," and marsupialization procedures were tried Our results were not good, and recurrences with failure of wound healing were frequent In the latter part of 1943, the routine treatment of pilonidal disease was altered Uninfected cysts and sinuses were not operated upon Infected cases were treated with sulfadiazine and hot sitz baths, and incision and drainage were performed when indicated Only those cysts were excised which presented repeated episodes of acute infection within a relatively short period of time The time of operation was fixed at two weeks after the complete subsidence of the infection With the institution of these methods our results improved Morbidity and lost man-hour rates greatly decreased, and the over-all problem of pilonidal disease became less perplexing

We ran a small control series of infected pilonidal-cyst cases treated conservatively, half of which received 25,000 units of penicillin every three hours for a total dosage of 1,000,000 units The other half of this control series received adequate sulfadiazine therapy for the same number of days The results indicated that penicillin had no particular advantage over sulfadiazine in the treatment of pilonidal disease

Hemorrhoids

It has been the firm belief of most proctologists and qualified surgeons that the only adequate treatment of internal hemorrhoids is their surgical excision by one of the recognized methods In this series, surgical excision of all internal and combined hemorrhoids of moderate to marked degree has been performed and a ligation-excision-suture technic followed It has proved satisfactory, because of the operative speed and the freedom from worry over postoperative hemorrhage Anal stricture is prevented by removal of as narrow a strip of mucosa as is compatible with the complete excision of hemorrhoidal tissue Cotton suture material (size 24) has been used exclusively in all our anorectal surgery It has seemed that there has been less postoperative edema and infection than with the use of chromic catgut These cotton sutures are removed without difficulty on the eighth postoperative day, and digital dilatation is performed every other day until the patient leaves the hospital Frequent digital dilatation, together with hot sitz baths and the rapid restoration of normal bowel function, form the basis of our postoperative care The average hospital stay following hemorrhoidectomy is fifteen days, after which the soldier is ready to perform full field duty

Fistula in Ano

The operative treatment of anal fistula has presented a problem almost as difficult as that of pilonidal disease An attempt was made to do a primary closure after excision of the tract, rather than to allow the wound to remain open The results proved so successful with primary closure that all subsequent fistulas were treated in this manner, including the difficult cases of branched and "horseshoe" fistulas In a good percentage of cases the fistulous tract had burrowed between the external and internal sphinc-

patient as rest, sunshine, food, and surgical treatment Other hospitals are stressing the manual arts One hospital is running a printing press and teaching patients who show interest and skill the trade of printing Another old and well-established hospital specializes in the work of the silversmith. Custom made jewelry is another field used by some hospitals

Some years ago occupational therapy was the vogue in the tuberculosis hospital, but with the tuberculous this was not successful for, while it kept the patient's hands and mind occupied while in the hospital, it had little, if any, financial return and it rarely led to a future occupation for the patient Today we speak of vocational therapy which really means treatment of the patient's mind, and the development of a hopeful and peaceful spirit through teaching him a vocation which he can utilize when he is ready to return to the competitive world of mankind

Men and women with tuberculosis are not essentially different from men and women who are not ill But their disease imposes upon them certain restrictions and problems from which the well man is free It is with these problems and restrictions that the rehabilitation of the tuberculous works

Rehabilitation may be defined as a process of education through which the patient goes to arrive at the best adjustment to his own future, his own health, to his family, to his friends, to society as a whole While this adjustment may be achieved alone, it is an adjustment which is achieved more easily and much better with help and direction.

Rehabilitation of the tuberculous is something, as I have already shown that need not and should not wait until complete cure has been accomplished, but should be started along with curing as part of the treatment of the patient. Therefore, in considering rehabilitation of the tuberculous, we must take into account not only the condition of the lungs of the patient, but the patient himself The lungs may be sick but this is no reason why the circulatory and digestive system should not be good, why the eyesight and hearing should not be good, why there should not be good arms and legs, skilled hands and intellects. In other words, in rehabilitating the patient, we must consider his total assets and what to do with them If his spirit is not broken and his disease not too far advanced, there is no reason why the tuberculosis patient should not leave the hospital better equipped to fight his battle with life than before he entered the hospital.

Problems in the rehabilitation of the tuberculous may be separated into four divisions medical, psychologic, social, and economic. The most difficult of these, and probably the most important, is the psychologic problem. Many patients realize that tuberculosis is a recurrent disease, that one attack does not protect them from other attacks, as in the case with measles or scarlet fever or whooping cough, on the contrary, one attack of tuberculosis makes a recurring attack more probable. This knowledge often frightens the patient, as he does not have enough health education to understand it fully

Patients also think of tuberculosis as something to be feared and soon learn that others fear it also People begin to avoid contact with him Former companions, fellow workers, even members of his own family may be the first to make this fear of the patient evident. Finding that he is a possible source of danger to others does not add to his peace of mind If the patient tries to remain at home while he is being cured, he has to be more or less isolated from the normal lives of the rest of the family, he worries about being a care to his family and he becomes preoccupied with his own misfortune On the other hand, if he is in the sanatorium where he should be, he is cut off from normal daily contact with his family, and in the course of the many months and sometimes even years of his cure, there is a tendency for a gulf to develop between himself and his family

One of the most important factors in the cure of tuberculosis is the long time it takes for treatment. That is why it is so very important that this time should not be empty of incentive, plans, and hopes Bed rest alone will not result in relaxation when a man is afraid that sometime in the future he will not even get his old job back again or one equally good And when he feels fairly well and his friends and family tell him that he looks well, when he can eat a good meal, and has put on some weight, there is a strong temptation to leave the hospital and return to work before he is well enough to return But the road back to health is not walked in a day, it requires an endless amount of courage, perseverance, and understanding, otherwise it means another breakdown at some time in the future which will probably be a more serious breakdown than the first.

Among the social problems which must be met and solved for each individual are the temporary or permanent loss of the family wage earner, the case of the boy or girl who must leave school or college, the worker who is ill and does not realize it or who has such a good job that he is unwilling to give it up until he becomes so seriously ill that he must give up, the patient who desires to go into the hospital but is unable to go because

there are no empty beds available Added to these problems, which we have always had with us, will now be the servicemen and women who are returning and who will continue to return with tuberculosis developed during their war service

Lessened earning power is costly not alone to the individual but also to the community Expenses mount with illness, hospitals bear a tremendous share of the costs but society as a whole pays the bills Then the skill of a patient in any line of work grows rusty during long periods of illness and these are investments which business and the community can ill afford to lose

These are some of the questions to which we must try to give answers and in which rehabilitation plays a big part They are problems which have not been completely answered but they are being worked out so that the patient can be rereturned to his old job or to a better one by beginning his training while still curing his lungs

So far as the medical problem is concerned, a patient should have an intelligent idea of his own disease He should know about cavities, he should know that even a small amount of infection means a large amount of care The patient must have a knowledge of things necessary for his cure, and he must learn to cooperate with his physicians and nurses in order to regain his normal mode of living Many of these problems are being worked on by others than the tuberculosis specialist Educators, social workers, occupational therapists, and rehabilitation directors supplied by the communities are trying to work out solutions

While the doctor may be doctor, lawyer, priest, or friend, he must not forget that other than medical problems continue to exist in the lives of men, and that these problems in men's lives are important to their health The physician, realizing that these other problems exist, must call in the specialists from these fields to help solve the social problems

The social specialists must work in cooperation with the doctor The doctor will understand that men and women wish to be active as soon as it is possible to be active, and he must guard the patient against too rapid rehabilitation Rehabilitation, or this process of education, is an orderly process in which the patient is the central figure and his physician the central guide

Rehabilitation considers all the foregoing problems and many others It works with the individual and with the community to convert ill-founded fear into well-founded hope It works under medical advice and on the basis of total physical, mental, and emotional capacities, building a practical program of activity It makes use of all available community resources toward an eventual life plan compatible with the patient's health, interests, abilities, and ambitions

The community itself must be taught that rehabilitation of the patient is as important to the patient and to the community as is the treating of his disease For without it, the chances are that the patient will break down again Rehabilitation does cost money but a lack of it costs more, not alone in illness, but in dollars and cents

---

Annual Meeting

Hotel Pennsylvania, April 29–May 3, 1946

THE attention of members attending the meeting is called to the fact that all scientific and commercial exhibitions will be available for inspection on Monday and Tuesday of that week, although the meetings of the sections do not begin until Wednesday The motion pictures will also be shown on these days

OBSERVATIONS OF PENICILLIN THERAPY IN GONORRHEA

JACOB FRUMKIN, M D , F A C S , Lt Col ,(MC),AUS, Schenectady, New York, and
ROBERT J RUARK, M D , Maj ,(MC),AUS, Raleigh, North Carolina

THE value of penicillin therapy in the treatment of gonorrhea is definitely established Numerous reports in the literature have demonstrated the glowing results of this miraculous drug

Thousands of cases have been quoted with astonishing percentages of cures The pendulum is swinging high in the early enthusiasm for the drug but in time, with more careful analysis of the statistics, the pendulum will swing back and level off to its true value An analogy can be drawn with the sulfonamides, the "stardust" of a few years ago The enthusiastic reception accorded these drugs waned with time until the true status of its efficiency was demonstrated. The early reports glowed brilliantly in the darkened sky of specific therapy, until the dawn of cold facts and figures was followed by the daylight of proved experience.

It should be emphasized that penicillin, although a most powerful antibacterial substance, is bacteriostatic and not bactericidal The exact manner of its action is still in the realm of conjecture, but evidence is accumulating which points to the interruption of cell division of bacteria. Experiments have demonstrated that susceptible organisms will resume growth with the removal of the drug Regardless of the degree of concentration of penicillin the bacteria, although temporarily inhibited, take up oxygen at a normal rate Consequently, it is of utmost importance that the infection be exposed to the inhibitory influence of the drug for a considerable period of time, while the defense mechanisms of the body actually destroy the invaders Since penicillin is rapidly excreted, usually in four to five hours, with the highest concentration within two to three hours, repeated doses will insure a continuous bacteriostatic effect, while the humoral factors can deliver the "knockout" blow

The following report is based on 1,349 unselected cases of acute gonorrhea treated at a U.S Army General Dispensary in Paris, France All the patients were ambulatory One thousand eighty-six cases were treated with 100,000 units of penicillin divided into five doses given intramuscularly, 210 cases were treated with penicillin and sulfathiazole combination, 10 cases were treated with 150,000 units of calcium penicillin in a gelatin capsule by mouth, 18 cases with 150,000 units of penicillin in beeswax and peanut oil injected intramuscularly in one dose, and similarly, 25 cases were treated with 200,000 units in beeswax and peanut oil in one dose

There are certain disadvantages which are encountered in the study of the results at a dispensary A large number of the patients were "casuals" or in Paris for only a few days, consequently adequate follow up studies could not be ascertained for our records. Those soldiers were instructed to contact their own medical officers for further checks upon return to their units The patients, who were assigned to the command that the dispensary serviced, were ordered to return the third day after treatment was administered and weekly thereafter for two weeks The entire period of follow up was seventeen days Although various means were taken to insure the follow-up visits, many did not return to the dispensary for one or more check-up visits, due to exigencies which arise in military operations

All patients were requested to refrain from use of alcoholic beverages and from intercourse for the duration of the seventeen days Although strict supervision was an impossibility, it is our impression that in the vast majority cooperation was given in this matter

In regard to the remaining group of 573 so-called "casuals" there is no doubt that the greater proportion was cured. It is unfortunate that this number could not be studied in order to give us a more complete picture and probably raise our percentage of cures somewhat. At least our observations impart definite impressions, which may be valuable in the true estimation of the drug

The diagnosis of gonorrhea was made by smears, in which the typical gram-negative intracellular diplococci were found Cultures were not done A brief history was obtained, with special emphasis placed on the period of exposure, appearance of discharge, previous venereal background, and treatment received Occasionally the diagnostic smears were not typical of the gonococcus even after repeated examinations, consequently that type of case was not computed in the statistics. There was no attempt to segregate the cases into anterior and posterior urethritis. Complications, such as acute prostatitis and epididymitis, were noted as such on the record

The follow-up examination consisted of microscopic urine analysis and smears by Gram stain, if the discharge persisted Relevant questions

were asked as to the time of the disappearance of the discharge, general state of health, and the development of unfavorable complications Prostatic massages were done on the first 74 cases

Treatment was routine and consisted of 20,000 units of penicillin administered intramuscularly every two hours until a total of 100,000 units was given The sodium penicillin was mixed with 10 cc of sterile distilled water, 2 cc of the solution contained 20,000 units There were no unfavorable results noted in the administration of the drug

In the first group of 1,086 cases of acute gonorrhea 418 completed three follow-up examinations An additional 95 completed two follow-up examinations, which were negative, and the patients were included in the results as cured Those patients who were only examined once were disregarded for the statistics In the total of 513 cases there were eighty-seven failures, or 16 per cent The authors are convinced that the number of failures is above the average as reported in the literature and that this, in all probability, is due to the large number of patients who did not return for subsequent checkups

A detailed analysis of the eighty-seven failures revealed a few interesting facts Thirty-five cases, or 40 per cent, became positive within three days after treatment Twenty-three, or 26 per cent, were positive during the fourth and fifty day Fifteen, or 17 per cent, were manifest between the sixth and tenth day Fourteen, or 16 per cent, became positive between the tenth and seventeenth days Of the latter 52 cases, 33, or 63 per cent, demonstrated negative microscopic examination or occasional pus cells per high-power field on the third checkup There were 16 cases of relapse not considered, as they occurred between seventeen and thirty days following the treatment Although the three follow-up examinations were negative, it was felt that they were reinfections

Prostatic massages were performed on the first 74 patients following the examination of the urine on the third follow-up visit All cases revealed a negative microscopic urine and were considered "cured" There were no symptoms referable to the disease The smears of the prostatic fluid, which were stained, were negative for the gonococcus Of the 74 unselected cases 50 revealed no pus cells or occasional pus cells, 9 showed 10 to 20 pus cells per high-power field, 8 manifested 20 to 40 pus cells, and 7 cases showed numerous or loaded pus cells per high-power field In spite of penicillin treatment and the apparent cure of the gonorrhea, 24 cases, or 32 per cent, demonstrated infection of some degree present in the prostate Whether the infection was present before the disease was contacted or incurred as a complication is difficult to ascertain In all probability repeated smears and culture would have disclosed interesting findings

Unfortunately, accurate scientific data are not always obtained during periods of stress in total warfare

Fortunately, we have had the opportunity to examine the prostatic secretion of penicillin-treated cases weeks and months later for various reasons, some not related to lower-urinary-tract symptomatology Occasionally the gonococcus has been discovered in the smear or culture Although the number of cases in this category is too small for definite opinion, it is our impression that more will be detected as time goes on The gram-negative diplococcus may be concealed by the fortification of penicillin security, a formidable barrier that only keen diagnostic acumen will blast

In the vast majority of the cases the discharge stopped the same day or the following day after treatment The microscopic urines were usually negative, although a few patients in the "cured" category did have signs of infection, which disappeared on subsequent examinations

TABLE 1 —RESULTS OF TREATMENT WITH 100,000 UNITS OF PENICILLIN

Author	No of Cases	Unit Dose	Total Doses	Per Cent Failures
Murphy, R. J [1]	65	20,000	5	1 6
Riba, L. W., Schmidlapp, C J., and Bosworth, N L.[2]	112	10,000	10	9 8
Sternberg, T H., and Turner, T B [3]	261	20,000	5	3 4
	172	10,000	10	3 5
Thompson, G J [4]	500	20,000	5	2 0
Scarcello, N S [5]	100,000	Units in divided doses		9 0
Robinson, J N [6]	1,000	10,000 or 20,000	10 or 5	5 3

The average percentage of failures of the above authors is 4 9 per cent It is felt that in our series of cases the percentage of cures would have been greater if a larger number of patients had returned for checkup It is doubtful, however, whether we would have arrived at the excellent over-all figure as quoted above

In the second group of 210 cases the treatment consisted of 1 Gm. of sulfathiazole, four times a day for ten days, and 100,000 units of penicillin divided into five doses injected intramuscularly every two hours The diagnosis was made by smear As in the first group of cases, treatment was routine regardless of the duration, severity, or drugs received, unless a definite contraindication to sulfonamides was

perceived The follow-up visits were carried out in the same manner as previously stated

Of the 210 patients, 153 returned to complete all three follow-up visits There were thirteen failures, or 8 per cent, which occurred within twenty days of the treatment. The earliest failures were on the third day with only 2 cases, whereas the majority relapsed between ten and twelve days The discharge in practically all of the 153 patients in this series ceased the same day as the penicillin treatment or on the following day Negative microscopic urines were found in all except 7 patients on the first follow-up examination. In addition, 13 patients revealed two negative urines but failed to return for the final checkup These could not be considered in the final results, as the recurrence for the sulfonamide-penicillin group was manifested on the average of the eleventh day The cure rate of 92 per cent concurs with other authors who employed this method of treatment.

The third group of patients was treated with 150,000 units of penicillin in a gelatin capsule administered by mouth in one dose Of the 10 cases there were eight immediate failures within three days. It was thought inadvisable to continue this method of attack and it was consequently abandoned.

The fourth group of patients was treated with 150,000 units of penicillin in beeswax and peanut oil injected intramuscularly in one dose Of the 18 patients treated, 16 returned for complete follow-up There were four failures, or 25 per cent, which were manifested after one or two days or the discharge continued unabated

In the last group of cases, 200,000 units of penicillin in beeswax and peanut oil was administered intramuscularly in one dose. There were 17 complete follow-up cases of the 25 who received the treatment. The failures were immediate and numbered five, or 29 per cent.

Penicillin Reactions

There were no severe reactions due to the administration of penicillin in any of the methods described A few patients developed chills and fever, which passed off by the following day In 5 patients after the first or second intramuscular injection of penicillin, the penis became markedly edematous, reddened, and tender with an abundance of purulent discharge. The picture presented was somewhat similar to the hyperacute stage of gonorrhea that was often seen during the "sandalwood oil-protargol era." The condition cleared rapidly within a day or two and was not considered an indication to cease treatment The probable explanation for the phenomena is in the same category as the Herxheimer reaction

One case of an acute abdominal flareup was observed in a patient who related a definite peptic-ulcer history The cramps, pain, nausea, and heartburn began during the penicillin treatment and continued throughout the night Point tenderness and some spasm in the epigastrium were elicited The patient was sent to a hospital for observation and was discharged on the second day, as all the symptoms cleared up

Complications

There was one case of a small periurethral abscess on the shaft of the penis, which gradually resolved after five days Surgical interference was not necessary

Acute epididymitis was observed in 4 cases. Penicillin treatment appeared to have no effect on the resolution, although the disease process did not progress and the pain abated earlier than usual Although many more cases of epididymitis were seen, it was deemed advisable to hospitalize because of the acute symptomatology

Conclusions

1 In a series of 513 cases of unselected acute gonorrhea there were eighty-seven, or 16 per cent, failures with 100,000 units of penicillin divided into five doses at two-hour intervals.

2 The relapse occurred within five days in 66 per cent of the eighty-seven failures.

3 Negative microscopic urines were found after three days in 37 per cent of the eighty-seven failures.

4 The combination of sulfathiazole and penicillin was successful in 92 per cent of 153 cases

5 There were no severe toxic reactions to penicillin noted in over 1,300 cases

6 In 5 cases an acute flareup of the discharge, accompanied by marked redness and swelling of the penis, was noted during treatment.

7 There was no dramatic response to penicillin in cases of epididymitis and periurethral abscess.

8 Some degree of prostatic infection was found in 32 per cent of 74 unselected and apparently cured cases of gonorrhea

PALINDROMIC RHEUMATISM IN CHILDREN

MARDOQUEO I SALOMON, M D , Bronx, N Y

BESIDES the "orthodox" forms of rheumatoid diseases there are some rare, but nevertheless very interesting clinicopathologic conditions in the joints and in the peri- and para-articular tissues that do not fit into the classic morbid entities established for the more common arthropathies For one of those syndromes the term palindromic rheumatism[1] has been coined Although the cases described by Hench and Rosenberg seem to be a fairly coherent, well-defined group (the case described lately by Cain[2] seems also to "belong" with reasonable certainty to the same group), there appears to be a less "airtight" frontier between the above-named syndrome and some other syndromes described by *Solis-Cohen*[3] under the name of angioneural arthroses and by Kahlmeter,[4] as allergic forms of rheumatism

The case or cases described in this paper differ somewhat from the classic type of palindromic rheumatism, first of all, by the fact that they concern children, all under 12 years of age, and in the second place by the very slight febrile movement at the beginning, at least in cases 1 and 3

Case Reports

Case 1 —A 9-year-old white South American girl in usually perfect health one day awoke with pains, slight swelling, and tenderness on the lateral aspect of the right shoulder joint and adjacent deltoid region The family history was noncontributory as far as her parents were concerned, but her younger brother suffered four years ago, at the age of 2 years, in Bolivia, South America, from an exactly similar condition in his right wrist I treated him at that time and made now in retrospect the same diagnosis as for the girl The personal past of the latter is completely irrelevant and could be summarized as follows whooping cough at the age of 3, tonsillectomy at the age of 5 on account of supposedly large tonsils, measles at the age of 6½ (shortly after arriving at this country), and chicken pox one year later Absolutely no history of allergic manifestations or vasomotor instability could be elicited The physical examination revealed a well-nourished, healthy-looking girl of the asthenic type No discoloration could be detected on the affected area, and the edema was inconspicuous, although it extended from the lateral border of the acromial zone to about the upper of the middle third of the right arm While the patient, an extraordinarily intelligent and alert child, complained of pains rather in the deltoid mass, deep palpation of the lateral aspect of the interarticular zone was only slightly less painful than the aforementioned deltoid muscular mass Motion aggravated the pains, but they did not subside entirely at rest There was no itching, and no analogy with angioneurotic edema or dermatositis. The general physical examination was negative, except for an inconstant typically nonorganic slight systolic murmur in the apical region Incidentally, I happened to notice occasionally that murmur in this child during the routine checkups that I performed on her every six months *before* her joint condition It had none of the characteristics of an organic murmur, and as a matter of fact, it disappeared on the next day X-ray examination of the joint and adjacent region was entirely normal, so, too, was her urinalysis, complete blood count, electrocardiogram, and sedimentation rate The rectal temperature was, however, 37 3 C , it became and remained normal on the next day There was no evidence of allergy or vasomotor instability Both the edema and the pains lasted for about six hours, but they reappeared next day, and lasted about the same time, after a period of complete remission for two days, they reappeared once more for several hours On the following day the left ankle became affected, then the left hip joint, and a few days later again, the right shoulder joint was attacked These attacks kept coming back a few times, almost always to right shoulder joint, but sometimes to the left ankle I would like to call attention, however, to the fact that both subjective and objective phenomena of the attack were by far more accentuated in the para-articular than in the articular regions, indeed, there was always in this child an intermediary zone, situated between the very painful para- and the mildly painful peri-articular region than was devoid of painful sensations altogether

No relation to food, weather, emotional disturbances, or, as a matter of fact, to any unusual or changing events, could be suspected or established After a few weeks of recurrences, the "attacks" disappeared without any objective or subjective traces

Now, then, we have here in résumé, a history, in a 9-year-old child, of painful mild swellings, appearing suddenly around and at some distance from the joints, mostly in the right shoulder joint, lasting several hours each, separated from each other by distances ranging from eighteen hours to two to three days and disappearing with complete *restitutio ad integrum* Except for the slight elevation of temperature at the beginning, no general systemic repercussions could be observed

Case 2 —A 10-year-old Jewish girl of the asthenic type came under observation after about three weeks of recurrent attacks, exactly similar to the ones described in Case 1, but localized in the knees, mostly the right one More exactly, the para-articular zones above the knee were definitely more involved than the knees themselves There was no abnormal temperature in that child, at least

after she was under my care Once again, the most painstaking general examination of the child was negative and remained so five months after the last attack took place, bringing to an end a period of three months of extremely frequent almost daily 'spells." A very careful orthopedic survey was negative

Case 3—A six year-old Irish American girl also started her "attacks" suddenly and with some fever (37 6 C), the only joint involved was the left ankle and the para-articular tissues above it, while the fever disappeared on the same evening, never to reappear again, the remaining signs and symptoms kept on coming back and disappearing for about two weeks. Incidentally in this particular patient the swelling was fairly conspicuous, much more than in the remaining patients.

Case 4—A 4-year-old Puerto Rican boy came under observation only after several weeks of very frequent recurrent attacks similar to Case 2 he had not been treated before for that condition, and when I saw him there was no fever No reliable data could be obtained as far as his temperature at the beginning of the disease was concerned In this boy all major joints were involved, again never more than one at a time, the seat of 'predilection" was his left ankle, however Otherwise the same general and particular pathologic patterns described for Case 1 were observed in this child, after another four weeks of frequent (about every other day) attacks, the child remained in perfect health

Comments

I believe that all four cases can and should be brought under one common clinicoanatomic denominator, and that notwithstanding some minor differences between these cases and those described by Hench and Rosenberg and later by Cain, a common denominator could and should be found for all of them, viz, that they all belong to the syndrome called palindromic rheumatism This belief is based on the following criteria (1) a practically similar clinical pattern, (2) the little constitutional reaction, (3) absence of relation to weather, food etc, (4) normal laboratory findings, especially blood count and sedimentation rate, (5) the para-articular involvement, a point to which we like to call particular attention, (6) the negative x-ray findings, and (7) the complete *restitutio ad integrum* without any cardiac or other sequelae Unfortunately, no biopsy material could be secured in any of our cases, this of course was also the case in the great majority of cases described so far It would be interesting to excise a small fragment of the diseased tissue both during and after the clearing up of the pathologic condition, in order to have a definite histologic picture of the organic substratum of the syndrome

Another point of importance is, obviously, the differential diagnosis. While the diverse forms of infective arthritis (gonococcic, pneumococcic, etc) could be readily ruled out, the differential elimination of rheumatic fever could, in the beginning at least, cause considerable, not to say insurmountable, difficulties, a concomitant murmur in the precordium would still enhance those difficulties While the characteristic features of typical rheumatic polyarthritis are well known, and too easily found to be overlooked, in many cases, probably, the differentiation must await the element of time to make certain, the same refers, also, to some cases of rheumatoid arthritis We believe that the aforementioned features of the palindromic syndrome make the differential diagnosis possible, once more, we would like to stress the importance of the para articular involvement.

As for the forms described by Solis-Cohen and by Kahlmeter, we believe that there should be no special difficulty in distinguishing them from a typical case of palindromic rheumatism, their character has been skillfully brought into evidence by the above-named authors Angioneural arthroses and *formes de nature réellement allergique*, when well pronounced, will certainly hardly, if ever, be mistaken on careful analysis for palindromic rheumatism, whose nature seems to us to be infectious, but "borderline cases" could easily mislead But would not their differential diagnosis be a matter of academic concern?

One final word about "treatment" of palindromic rheumatism Its prognosis being excellent not only *quoad vitam*, but also *quoad functionem*, we systematically used only mild analgesics of the acetylsalicylic type

DIAGNOSIS

While the diagnosis of the patient who had eaten rather generously, was proceeding, the sick man said 'Doctor, do you think the trouble is in the appendix?"

Oh, no said the doctor, "not at all. The trouble is with your table of contents '

—*Canadian Doctor*

TREATMENT OF SUBACUTE BACTERIAL ENDOCARDITIS WITH PENICILLIN

Report of Ten Cases

LOUIS H SIGLER, M D , THOMAS J LONGO, M D , and HAROLD H FELDMAN, M D , Brooklyn, New York

(From the Departments of Medicine and Cardiology, Coney Island Hospital)

THOSE of us who have had experience in the treatment of subacute bacterial endocarditis know how helpless we were to save the life of the afflicted patient The various antiseptics used by mouth, intramuscularly, and intravenously, such as gentian violet, mercurochrome, the various arsenicals, vaccines, and sera, all have had their day and have brought with them discouraging disappointments Repeated transfusions were temporarily effective in improving the condition of the patient, only to end in death

With the advent of the sulfonamide drugs and their curative effect on some blood infections, we hopefully began to use those drugs, but with similar disappointments Kelson and White[1] suggested the combined use of sulfanilamide and heparin, the former purporting to kill the infection and the latter to prevent the deposit of fibrin at the site of the infection Although in their first enthusiasm they reported apparently good results in 3 out of 6 patients so treated, it was soon found to be valueless Thus, Katz and Elk,[2] Lynch and coworkers,[3] and others found absolutely no effect from this method of treatment on the course of the disease or on the pathologic process, *as determined by postmortem examination* Heparin alone has been suggested and used with complete failure McLean[4] collected 67 cases from the literature that received this treatment without any effect On the contrary, in 9 of these cases, death was apparently caused by the treatment itself, which induced cerebral hemorrhage

The ineffectiveness of the sulfonamides alone or combined with heparin in the treatment of this disease is well illustrated in the review of the literature by Lichtman[5] up to 1943, covering 704 cases The total average recovery rate was 5 5 per cent Of this group, 489 patients were treated with sulfonamide alone, with a recovery rate of 4 per cent, and 215 patients received both sulfonamide and heparin, with a recovery rate of 8 5 per cent The "estimated" incidence of spontaneous recovery, according to Libman and Friedberg,[6] is 3 to 5 per cent We can, therefore, see how the "cures" attributed to those methods of treatment may well be cases of spontaneous recovery In a series of 67 patients reported by Galbreath and Hull,[7] 42 of whom received the sulfonamide drugs, all died We likewise have never seen any "cures" that could be definitely attributed to these drugs

Because of the failure in all previous methods of treatment of subacute bacterial endocarditis, it is gratifying to note the excellent results obtained by various authors by the use of penicillin in this disease We have had the opportunity to use this product in 10 cases of subacute bacterial endocarditis with successful outcomes paralleling reports by other authors Because the total number of cases so far reported is small and there is some divergence of opinion as to the best methods of the use of this product in this disease, we are reporting our experiences

Case Reports

Case 1 —F K., a woman, 32 years old, was admitted to the hospital on July 5, 1944, with shortness of breath, choking sensation, and palpitation. She had had rheumatic fever at 15 years of age and was subject to some dyspnea on exertion occasionally since then About three weeks previous to admission she began to feel tired and lost some weight. She presented moderate pallor, cardiac enlargement, auricular fibrillation, and mitral insufficiency with low-grade stenosis Repeated blood cultures yielded Streptococcus viridans, twelve, fifty-five, and sixty colonies per cc Later she showed petechiae and splenic enlargement Penicillin, 25,000 units, was given intramuscularly every two hours for thirty-nine days Her condition greatly improved She gained considerable weight, the hemoglobin increased from 54 per cent to 82 per cent, and subsequent blood cultures were persistently negative. She was discharged from the hospital on September 20, 1944 and was perfectly well fourteen months later, She was able to carry on her housework without discomfort

Case 2 —T A., a boy, 14 years old, was admitted to the hospital on August 6, 1945 with complaints of weakness, elevation in temperature, loss of appetite, dyspnea, and loss of 16 pounds in weight in two months previous to admission. He had mitral and aortic insufficiency and stenosis of rheumatic origin. There were some petechiae and splenic enlargement. A blood culture showed Str viridans, seventy-five colonies per cc Penicillin was given between *August 10 and September 5, the first three days* 20,000 units and after that 40,000 units every three hours, which made a total of about 4,800,000 units The temperature dropped to normal soon after penicillin

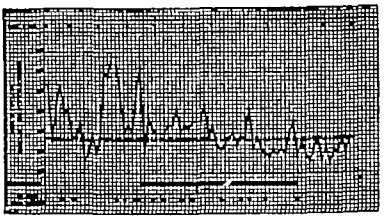

FIG 1 Case 1

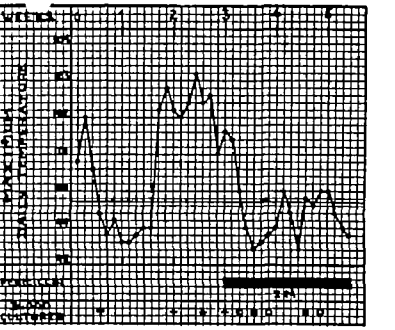

FIG 2. Case 3

therapy was started. His color improved, his weight increased, and all symptoms subsided Two months after his discharge from the hospital there was no evidence of recurrence of symptoms The blood culture remained sterile.

Case 3—M I, a man, 19 years old, was admitted to the hospital on August 31 1944 because of pain in the right calf, cough weakness, and rise in temperature of three weeks' duration. He showed marked emaciation pallor, some dyspnea and orthopnea and aortic and mitral stenosis and insufficiency of rheumatic origin. The spleen was slightly enlarged and there was slight clubbing of the fingers and toes. Blood cultures taken on September 4, 14 18 and 21 showed Str viridans seven, fifty, forty and seventy-four colonies per cc. respectively Penicillin was given between September 21 and October 8, 1944 in doses of 25 000 units every two hours intramuscularly, a total of about 5 400 000 units. His condition progressively improved and all symptoms subsided. Several subsequent cultures were negative. He was perfectly well and very active over one year after his discharge.

Case 4—M H K., a man 32 years old with inactive rheumatic mitral insufficiency since 10 years of age, developed gradually progressive weakness, loss of weight, occasional floating body pains, chills, and rise in temperature He came under observation of one of us (L. H S) three months after the onset of symptoms, during which time he was treated by another doctor with sulfa drugs without any effect. He presented moderate pallor, some petechiae in the conjunctivae and slight splenic enlargement. Two blood cultures yielded Str viridans twenty-five and thirty colonies per cc. of blood Penicillin was given intramuscularly, 25,000 units every two hours, for three weeks. The temperature which had previously ranged between 100 and 103.5 F came down to 98.6 F on the third day and remained so throughout this period with an occasional rise to 100 F Four blood cultures showed no growth. His condition remained good nine months later and repeated blood cultures were negative. He carried on his work as a salesman without discomfort.

Case 5—M C., a woman 50 years old was admitted to the hospital on October 7, 1944 because of progressive weakness, general malaise loss of weight, and elevation in temperature, of six months duration. She had evidence of mitral insufficiency and stenosis. The spleen and liver were enlarged The fingers showed slight clubbing and two erythemous nodes and she had considerable pallor Four blood cultures yielded a microaerophilic streptococcus. Penicillin was given in doses of 25 000 units intramuscularly every two hours, between October 17 and November 2, 1944. Her condition and color greatly improved and subsequent blood cultures were all sterile. On November 11, 1944 she suddenly became comatose and developed rapid stertorous, noisy breathing her pupils became dilated and did not react. The reflexes of the lower extremities became exaggerated and there was a bilateral ankle clonus She died several hours after the onset of cerebral symptoms.

On autopsy the heart weighed 400 Gm. The musculature was flabby and the left auricle was moderately dilated The mitral leaflets showed a few fully organized verrucose vegetations at the free borders, but not evidence of fresh vegetations. The chordae tendineae were fused and shortened and there was some rigidity of the mitral leaflets with narrowing of its orifice The other valves were normal The liver and spleen showed congestion and enlargement. The left kidney showed a healed infarct. No permission was granted to section the head. She undoubtedly died from a cerebral embolus.

Case 6—K. S., a woman, 30 years old was first seen by one of us (L. H. S) on February 15, 1944. She had had mitral insufficiency of rheumatic origin since 13 years of age but felt well until December 1943, when she began to experience weakness, dyspnea palpitation, persistent rise in temperature up to 103 F and a rapid heart rate. She showed pallor nervousness, several petechiae over the body, and erythemous nodes on the fingers A blood count showed 3,200 000 red blood cells, 60 per cent hemoglobin, and slight leukocytosis. Two blood cultures showed thirty-two and one hundred colonies of Str viridans per cc. of blood She had received sulfadiazine in large doses elsewhere without effect. Penicillin was given intramuscularly in daily doses of 200 000 units for fourteen days, at two-hour in

tervals The temperature dropped to normal in three days and remained so Her general condition greatly improved

Several weeks later symptoms and signs recurred, and she was admitted to the Coney Island Hospital, on May 17, 1944. Blood cultures on two occasions again showed Str viridans, one hundred and one hundred and thirty-four colonies per cc The temperature ranged between 101 and 103 F Penicillin was given intramuscularly in doses of 300,000 units daily from May 24 to June 15 The temperature came down to normal three days after penicillin therapy was started and remained so throughout this period Her general condition greatly improved Repeated blood cultures were negative until July 3, when it again showed 25 colonies per cc Penicillin therapy was resumed intramuscularly in doses of 25,000 units every two hours and was continued until August 4. The temperature remained normal except for an occasional rise, and her general condition improved The white-blood-cell count varied between 11,600 and 15,600 the first fifteen days and 6,800 and 8,400 later Repeated electrocardiograms showed no gross alterations She was discharged on August 6 She was readmitted on August 23 because a rise in temperature recurred Cultures again showed twenty-four and fifty-six colonies of Str viridans per cc of blood Penicillin was again given intramuscularly every two hours between August 29 and September 20, 1944, a total of 6,300,000 units Her condition remained excellent until her discharge from the hospital on September 29, 1944.

On October 17, 1944 she again developed a rise in temperature and experienced nausea, vomiting, headaches, and nosebleed She was readmitted on October 18, 1944. Blood cultures on October 19 and 20 were negative On October 22, a culture showed twenty-one colonies of Str viridans per cc Penicillin was again given in doses of 25,000 units every two hours for thirty days The total amount received was 9,000,000 units Blood cultures during this period were sterile She was symptom-free and the temperature was normal She was discharged on December 5, 1944.

She remained symptom-free and carried on her usual housework for two months. Then she began to experience dyspnea and weakness and developed some pallor and marked cyanosis and was readmitted on March 6, 1945 The heart at that time was larger and the apical systolic murmur previously heard was louder and more widespread She remained in the hospital over three months Seventeen blood cultures obtained were sterile. Only on one occasion was a growth of streptococcus obtained in broth only, and penicillin was again given for seventeen days She developed auricular fibrillation, marked liver enlargement, and peripheral edema Repeated electrocardiograms showed progressive alterations in the ventricular complexes She also developed swelling of the right arm and supraclavicular region, probably due to venous thrombosis of the right subclavian vein. Heparin was given but her general condition became aggravated and it was discontinued There was very little response to digitalis and she finally died from congestive heart failure in July, 1945

Case 7—B F, a woman, 70 years old, was admitted to another hospital on April 3 1944 with complaints of progressive general malaise, cough, increasing dyspnea, and a febrile state of five months' duration Three cultures yielded Str viridans. From April 11 to May 13, 1944 she received 6,000,000 units of penicillin in divided doses of 25,000 units every three hours intramuscularly The temperature was reduced to normal and remained so until her discharge on May 20, 1944 and repeated blood cultures were sterile Two weeks after her discharge symptoms returned When admitted to the Coney Island Hospital on June 23, 1944, she presented moderate pallor, some petechiae in the conjunctivae, marked peripheral arteriosclerosis and evidence of calcific aortic stenosis, coronary sclerosis with myocardial fibrosis, auricular fibrillation, and a suggestion of subacute bacterial endocarditis affecting the mitral and aortic valves Blood cultures on June 26, 29, and July 3 yielded Str viridans, fifty-nine, one hundred and seventy-seven, and forty-six colonies per cc, respectively Penicillin was given intramuscularly in doses of 25,000 units every two hours from July 5 to 31, 1944. The temperature returned to within normal limits and she was symptom-free to the end of her discharge on September 18, 1944. Repeated blood cultures remained sterile In early December she developed hemiplegia, from which she recovered in two weeks

On January 31, 1945 she was readmitted to the hospital because of abdominal pain and dysuria There was marked congestive heart failure. An x-ray series of the gastrointestinal tract was negative There was no evidence of subacute bacterial endocarditis and repeated blood cultures were negative The sedimentation rate was normal She responded to digitalis and intravenous mercurial diuretics and was discharged in good condition on February 24, 1945 At home she developed another episode of congestive heart failure two months later and she died

Case 8—E B, a woman, 22 years old, was admitted to the hospital on March 21, 1944 complaining of progressive weakness, loss of weight, poor appetite, and fever and chills of three months' duration She was pale, emaciated, dyspneic, and cyanotic, and presented mitral and aortic insufficiency and stenosis that she acquired in early life.

Repeated blood cultures yielded Str viridans, forty to fifty colonies per cc of blood

Penicillin therapy was given by continuous intravenous drip, in doses of 200,000 units daily, between April 3 and 18, the total amount used being about 2,800,000 units The temperature, which before ranged between 99 and 105 F, came down for about one week to 99 F with an occasional rise to as high as 101 F Her general condition also somewhat improved. Soon, however, the temperature began to spike again to as high as 105 F while under treatment, and occasional showers of petechiae appeared. Secondary anemia and leukocytosis of 10,000 to 17,000 presisted The urine showed red blood cells She died in congestive failure on April 20, 1944.

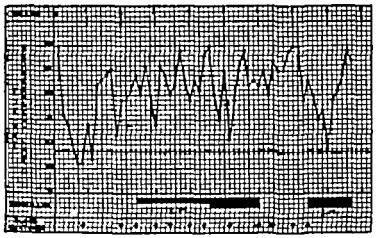

FIG 3. Case 10

Case 9—R. M., a man, 53 years old, was admitted on April 10 1944 to another hospital with complaints of pain in the left calf muscles sweating loss of weight and afternoon rise in temperature of three months' duration The hospital reported a systolic murmur at the apex splenic enlargement some petechiae on legs, a low-grade secondary anemia, and repeated blood cultures of Str viridans Between May 10 and May 15 he received 20 000 units of penicillin every two hours, intramuscularly a total of 1 200 000 with no improvement. He apparently received no more penicillin but only supportive treatment until his discharge on June 21, 1944. He was admitted to the Coney Island Hospital on June 22, 1944 and before we established the diagnosis of subacute bacterial endocarditis by repeated blood cultures he died on June 27, 1944. Three blood cultures yielded Str viridans, fourteen thirty-seven, and fifty three colonies per cc The electrocardiogram revealed a low-grade auriculoventricular block and evidence of myocardial damage. He had marked secondary anemia and leukocytosis, increased sedimentation rate many red blood cells in the urine and an increase in blood urea nitrogen to 58 mg. per 100 cc. of blood.

Case 10—I R., a 41-year-old woman, was operated on at the New York Hospital on April 14, 1944 for adenocarcinoma of the rectum. Following her discharge from that hospital on June 4, 1944, after a stormy postoperative course she developed increasing pallor and palpitation, weakness occasional rise in temperature and cough. She was admitted to the Coney Island Hospital on August 2, 1944. She showed evidence of aortic insufficiency and stenosis and mitral insufficiency The lungs showed some congestion. The liver and the spleen were moderately enlarged. Repeated blood cultures showed Str viridans varying from twelve to as high as six hundred and twenty five colonies per cc. of blood. Penicillin was given between August 18 and September 1 in amounts of 25 000 units every two hours by the intramuscular route. Her condition became progressively worse, however She developed clubbing of the fingers, cyanosis respiratory embarrassment, marked peripheral edema, and increasing anemia. Transfusions were given with slight temporary improvement. Beginning September 5 50,000 units were given every two hours, with absolutely no effect In view of the recent operation for adenocarcinoma, and the onset of a deepening jaundice and liver enlargement, and in view of the fact that the abdominal wall at the site of the incision showed hard nodular masses, a diagnosis of metastatic carcinoma was considered in addition to subacute bacterial endocarditis. Left pyonephrosis was also considered in view of a large mass felt in the left abdomen which extended beyond the region of the spleen. This was corroborated by an intravenous pyelogram. Blood counts showed an increasing secondary anemia and the white cells varied between 6 200 and 12,800 Electrocardiograms showed progressive changes in the configuration of the ventricular complexes. The temperature varied between 100.8 and 104 F At one time she developed a pericardial friction rub She died on September 29 1944

The autopsy findings were moderate cardiac enlargements, thin hematoma of pericardium over its anterior aspect beefy consistency of the myocardium. Very large pinkish yellow friable vegetations with greenish base covered the superior surface of the anterior and posterior mitral valve leaflets, with ulceration of the centers and actual perforation through the valves, the aortic valve leaflets were irregular, shortened, tortuous, and completely covered by heaping vegetations of friable consistency and yellowish pink in color, which almost completely obliterated the aortic ring The tricuspid and pulmonic valves were normal. The lungs were moderately congested. The liver weighed 2 000 Gm. Its surface was covered with numerous petechial hemorrhages and it showed marked fatty degeneration. The spleen was markedly enlarged weighing 500 Gm. and showing several infarcts. The kidneys had numerous hemorrhagic areas and multiple small infarcts. The left kidney pelvis and ureter were markedly dilated and filled with pus. No recurrence of the carcinoma was noted and there was no evidence of metastasis.

Discussion

It will be observed that of our 10 definitely established cases of subacute bacterial endocarditis treated with penicillin, 4 patients are alive and well two, nine, twelve, and fourteen months, respectively, after therapy was discontinued. One patient died from a cerebral embolus after all signs of subacute bacterial endocarditis had disappeared and postmortem examination revealed healed verrucae on the mitral valve Two other patients died from congestive failure, after repeated penicillin therapy In one of these, the congestive failure was evidently due to recurring rheumatic carditis. The other was in an elderly woman, over 70 years, with extensive arteriosclerotic heart disease. The incidence of recovery from subacute bacterial endocarditis itself is, therefore, 70 per cent

Of the other 3 patients, R. M (Case 9) definitely received an insufficient amount of penicillin Thus may be true also in Case 8. In Case 10

the resistance of the patient was undermined by pre-existing adenocarcinoma of the rectum and by the additional presence of pyonephrosis, the causative infective organism of which was not determined It probably was a type which does not respond to penicillin therapy She presented acute ulcerative endocarditis with overwhelming toxemia

Of the various authors who reported the treatment of this disease with penicillin only Herrell and coworkers[8] found it to fail in all 4 cases in which they used it. They felt, however, and rightly so, that the dosage they used was insufficient for this disease Dawson and Hobby[9] treated 5 patients with Str viridans endocarditis, two of whom are living and well thirteen and nine months later, respectively, in one the infection recurred, one did not respond because of inadequate treatment, and one was a flat failure In 9 cases treated by White and coworkers[10] there was definite control of the infection in 6, or 67 per cent, but one of these died of cerebral embolism and another of rheumatic fever Meads and coworkers[11] treated 9 cases of subacute and 7 cases of acute bacterial endocarditis Seven of the former and 3 of the latter patients responded and are living and well Dawson and Hunter[12] treated 20 patients, with apparent success in 15 In two others the condition recurred but was controlled by further treatment Paullin and McLoughlin[13] observed good results in 3 out of 6 cases treated, the other 3 appeared hopeless from the start Goerner and coworkers[14] treated 12 patients, 11 of whom were alive and well one to fifteen months afterward, at the time of their report, and only 1 died of the disease Bloomfield and coworkers[15] obtained good results in 8 of 11 cases of subacute bacterial endocarditis and Dolphin and Cruickshank[16] in 4 of 6 cases of acute bacterial endocarditis Flippin and associates[17] recently reported the subsidence of infection in 16 out of 20 patients with subacute bacterial endocarditis, 12 of whom were alive at the time of the report, and four having died of heart disease but not from the infection

The methods of administration of penicillin in subacute bacterial endocarditis is still a matter of some dispute Loewe and coworkers[18] advocate its use in daily amounts of 40,000 to 200,000 units to be given by the intravenous route together with 300 mg of heparin given subcutaneously every second day or 200 mg daily by venoclysis In a later report Loewe[19] showed that 74 per cent of 54 patients treated with this combined treatment recovered Of these, 37 were alive and well two to fifteen months afterward, at the time of their report This incidence of recovery is certainly no higher than the incidence of recoveries reported by all the other authors mentioned before who used only penicillin, without heparin We are therefore not convinced that the addition of heparin has any advantage Meads and coworkers[11] and Dawson and Hunter[12] used the combined method in some of their cases and found the response to be no better than from penicillin alone Besides, penicillin treatment alone is less hazardous

The question whether the intravenous route of administration of penicillin is preferable to the intramuscular cannot as yet be definitely answered Some authors, including ourselves, have used single intramuscular injections at two-hour intervals and the results were as good as when given intravenously Of the 3 patients who died from the disease in our series 1 received penicillin by the intravenous route Another one died not because it was given intramuscularly but because it was given in small amounts and over a very short period The third patient died from ulcerative endocarditis, in which case the extremely low resistance of the patient and other complications were undoubtedly contributing factors

Goerner and coworkers[14] feel that the intravenous route is preferable Considering the successful results they obtained, one would be inclined, at first thought, to agree with them We must realize, however, that in the treatment of disease it is not merely the method employed which determines the outcome but also the constitutional condition of the patient at the time of treatment and his susceptibility to disease These factors cannot be measured with scientific accuracy in any small series of cases In a city hospital, such as ours, nearly all patients are poorly nourished and their resistance is undermined by years of improper hygiene, overwork, and exposure The outcome of any treatment in such cases is expected, therefore, not to be as favorable as in patients belonging to more favored classes The patients also lack the individual attention of private nursing which helps recovery

With our present experience we feel that the most important factor is not the route of administration of penicillin in this disease as the amount used If massive doses, at least 25,000 units every two hours, are given intramuscularly for three to six weeks, the results will be good in most cases, and it is more convenient to the patient than the continuous intravenous or intramuscular drip If insufficient response is obtained it should be given in much larger dosage and the intravenous route should be tried Frequent change of one to the other route may perhaps be better in some cases

It is essential, for a successful outcome, to remove all foci of infection under the protection of penicillin In two of our successful cases several

infected teeth yielding the same organisms as the blood culture were removed before the patients were discharged

In conclusion it must be added that inasmuch as subacute bacterial endocarditis is characterized, at times, by remissions for prolonged periods and in a rare case apparently by spontaneous recovery, we must be cautious not to attribute the successful outcome in all cases to the use of penicillin We must also have a much longer period of observation, say several years, to determine the ultimate outcome of those cases that show complete recovery The immediate results, however, are so striking that they leave no doubt as to the efficacy of this treatment in this hitherto most fatal disease

Summary

Ten patients with subacute bacterial endocarditis were treated with penicillin Four of these are living and well two, nine, twelve, and fourteen months, respectively, after therapy was discontinued One patient died from a cerebral embolus after all signs of the disease subsided, and autopsy revealed healed verrucae on the mitral valve. Two patients died from congestive heart failure after all signs of subacute bacterial endocarditis had subsided One patient died because an insufficient amount of penicillin was given, and another because of other complicating diseases Only one patient, presumably effectively treated, died from subacute bacterial endocarditis itself

The simplest and efficient method of administration of penicillin in subacute bacterial endocarditis is by the intramuscular route in doses of not less than 25,000 units every two hours There is no definite advantage to the intravenous route, although it should be used if the response by the intramuscular route is not satisfactory There is no advantage to the use of heparin in combination with penicillin, and it carries considerable hazard

SURGERY FOR THE AGED SHOULD NOT BE VIEWED WITH ALARM

Surgery for the aged—increasing in importance today—should not be considered with fear or alarm by patient and family, urges Louis Carp M D., in the August issue of *Hygeia, The Health Magazine*

Dr Carp, a New York City surgeon, points out that the increasing span of human life is offering a greater challenge to doctors. Based on the latest census figures, there was an increase of 35 per cent of persons over 65 years of age between 1930 and 1940 In another 15 years, life expectancy should reach 75 years. Consequently, the health, social economic, and political significance of the increase of life span must be emphasized

'Old age does not necessarily prevent surgical procedures" Dr Carp remarks, "which may save or prolong life, produce continued physical comfort and the relief of pain, and add economic, functional, and social usefulness. Today there are still many instances of a defeatist attitude toward surgery for the aged on the part of both patient and family alike These outdated attitudes should be abandoned in favor of a more progressive outlook, the result of marvelous advances in medicine and surgery in the past quarter century It should be our aim to "add life to years and years to life''

"Modern methods and scientific advances ' the surgeon explains, "especially in chemistry and refinements of technic and anesthesia, have so improved surgical standards that it is essential for old people afflicted with a surgical condition, and also their families and friends, to adopt a more hopeful and favorable attitude toward surgical results and to consider that what appears to be a radical step may turn out to be conservative after the operation One of the purposes of medical preparedness is to improve the health of our civilian population. This calls for cooperation on the part of the aged and when a surgical condition gives rise to a menace to life incapacity and dislocation from everyday economic functional and social routine surgical treatment will produce cure or improvement so often that the patient can go on with a happier, healthier life and a more hopeful and more optimistic perspective."

ELICITATION OF THE BIG-TOE RESPONSE (BABINSKI SIGN) IN TICKLISH SUBJECTS

MATTHEW BRODY, M D , Brooklyn, New York

NO SELF-RESPECTING neurologist would consider an examination complete without an attempt to elicit Babinski's sign The normal plantar response (negative Babinski) after a noxious stimulus of the sole of the foot is a plantar flexion of the big toe at the metatarsophalangeal joint The optimal reflexogenous zone for the flexor plantar response is the medial side of the sole In infancy, and when the corticospinal tract is affected above the third lumbar segment, noxious stimulation of the sole induces a dorsiflexion of the big toe (Babinski's sign) at times associated with fanning (signe de l'éventail) and plantar flexion of the lesser toes The optimal reflexogenous zone for the extensor plantar response is along the lateral side of the sole It is the first movement of the big toe that is significant

Some patients are so ticklish that stroking of the sole induces a forceful withdrawal of toes and foot and flexion at the knee accompanied by some expression of displeasure Some squeamish patients may misinterpret this procedure and object to what they consider an undignified attempt to tickle their feet in the sick room

Some may say nothing about their misgivings although they might think much An attempt to prevent withdrawal of the foot by forceful grasping of the ankle before testing the reflex may result in a tug of war between patient and examiner with loss of patience to both Another means of circumventing this response to tickling is to have the patient's knee flexed, and then stroke the median side of the tibia downwards (Oppenheim maneuver) while stroking the sole This does not always succeed

I have found a simple and usually successful method of avoiding the reactions to tickling If a patient is found to be ticklish or squeamish when Babinski's sign is sought, he is then requested to determine "Which feels sharper?" The physician then strokes first the lateral sides of the two soles, and then the medial sides, forward to the toes, observing the response of the toes With the patient's attention fixed on an attempt to evaluate the sharpness of the strokes, the tickling response is usually suppressed, the flexor plantar response is reinforced, and the confidence of the patient in his physician remains unshaken

WHO WILL WIN AND WHO WILL LOSE?

Who Will Win?

Who will win if national compulsory sickness insurance is inaugurated in this country?

1 A few physicians who are willing to practice mass medicine, who are willing to abandon the ideals of medicine and render an indifferent, impersonal type of low-standard service to the public

2 A large group of politically minded job hunters who would receive pork-barrel appointments as administrators of a vast governmental bureau

3 Certain politicians, until the time of reaction arrived as a result of the demonstrated defects of compulsory sickness insurance

Who Will Lose?

1 The taxpayer, who will be burdened with a tax for which he receives little in return

2 The nontaxpayer, the poor, who now receive the best of medical care from our best physicians in accordance with the ideals and traditions of the profession, and who are not provided for under the compulsory program

3 The public, the gullible public, who accept without question the promises and arguments of politically ambitious persons in favor of national socialism

4. Industry, which will be taxed a portion of its profit to support a program resulting in more work days lost This portion of its profits might better be devoted to the salaries of employees to give them more real security

5 Our community hospitals, which will be forced to abide by governmental regulations and to adjust their standards of service to the lower per diem payment allowed under the Scheme

6 Our Blue Cross Plans, which have demonstrated that the cost of hospitalization can be met for the majority of our people on a voluntary, democratic basis

7 Our children and our children's children, because of lowered health and health standards and through relieving them of the sense that they must be responsible for their own welfare

8 Our labor unions, who disregard the warning of their great leader, Samuel Gompers, when he said in 1916, "For a mess of pottage, under the pretense of compulsory social insurance, let us not voluntarily surrender the fundamental principles of liberty and freedom, the hope of the Republic of the United States, the leader and teacher to the world of the significance of this great anthem chorus of humanity—liberty!"—*J M Soc N. J , Dec , 1945*

COEXISTENCE OF GOUT AND METABOLIC CRANIOPATHY

WILLIAM FEHRING, Capt ,(MC),AUS*

(From the Medical Service of the AAF Regional Station Hospital, A.F T.A C , Orlando, Fla)

THE entity designated as metabolic craniopathy has received consideration under various names. It has been widely discussed as the Morgagni-Stewart-Morel syndrome[1-4] hyperostosis frontalis interna,[4,7] calvarial hyperostosis[8] and metabolic craniopathy.[9,10] The condition has also been called intracranial osteophytosis,[11] internal frontal endocraniosis,[12] exostosis within the cranium,[13] enostoses within the calvarium,[14] frontoparietal craniostosis,[15] and hyperostosis calvarii interna.[16] A review of the literature fails to disclose that this disease has been found to coexist with gout. Although the incidence of metabolic craniopathy has varied in recent reports, it appears that the condition is decidedly uncommon in men. On the other hand, gout is seldom observed in women. It is this unusual restriction of these diseases to the sexes that makes their coincidence the subject of this report.

Case Report

Z F K., a 29-year-old, obese, white soldier, whose civilian status had been that of a laborer, was admitted to the hospital on April 12, 1944, for pain in the right big toe Of the patient's immediate family the mother, a younger brother, and two sisters were obese but familial illnesses were not known to exist. In childhood the patient had been afflicted with measles, mumps, chicken pox, and German measles. Obesity was first observed at the age of 9 years. In 1942 he suffered an attack of asthma but recurrences never appeared. Since September 1942 he had become aware of a regular single nocturia, but polyuria, polydipsia, or polyphagia were not observed.

The onset of the present illness was in 1943, when he was awakened by an acutely swollen, painful discolored right big toe. This condition lasted about two weeks but receded rapidly with the application of hot soaks. In March of 1944 his sleep was again interrupted by a recurrence of a similar swelling in the left big toe. The discoloration and edema extended along the dorsal and medial surfaces of the foot but spontaneously disappeared within several days. Desquamation of the overlying skin or the nail did not ensue. Since then there were milder repetitions of the ailment in either big toe but never more than two to three days in duration. For about one year prior to hospitalization he complained of dyspnea on exertion for which treatment with thyroid extract had been undertaken

The patient appeared as an obese, lethargic, prognathic individual, 5 feet 2 inches tall weighing 210 pounds. The right big toe was swollen, tender, painful, and itchy Although pressure over the first left metatarsophalangeal joint elicited tenderness, the region did not appear abnormal. The blood pressure was 122/80 and the chest did not reveal any remarkable features. The abdomen was prominent, the testes were normal and equal in size and consistency, and the secondary sex characters were of the usual male appearance There were no manifestations of infantilism, hypoplasia, virilism, hirsutism, acrocyanosis, or dermal striae The fingers appeared short and stubby

The following data were obtained during the first period of observation urine analysis revealed no abnormalities, red blood count was 4,580,000 and the hemoglobin, 90 per cent, white blood count, 6,100, and the differential count showed 56 per cent polymorphonuclears, 36 per cent lymphocytes, and 8 per cent eosinophiles, Kahn and Wassermann tests were negative, nonprotein nitrogen was 31.2 mg per cent, urea nitrogen, 16 9 mg per cent, fasting blood sugar, 83 3 mg. per cent, blood uric acid, 4 and 3 56 mg per cent cholesterol, 219 and 305 mg. per cent The sedimentation rate by the Westergren method was 19, the basal metabolic rate was plus 13, plus 17 minus 1, and minus 8 (the first two tests were performed while the subject was taking thyroid extract)

Although the patient was advised to take acetyl salicylic acid, 20 grains every four hours, the arthritis suddenly returned during the night of July 1, 1944 three weeks after therapy was started. On this occasion there was pain, heat, swelling, redness, and tenderness of the left knee, and a mild elevation of the body temperature to 100 F Sodium salicylate replaced the acetylsalicylic acid and 20 grains were administered every four hours Notwithstanding the regular administration of the drug, the arthritis migrated to the right ankle, where pain was severe enough to necessitate the use of codeine on July 5 The temperature reached 100 4 F , the white blood count was 10 800, of which 60 per cent were polymorphonuclears, the uric acid blood content was 19 mg per cent, and the sedimentation rate rose to 40 mm per hour An electrocardiographic tracing did not show any abnormalities. On July 11 only slight discomfort of the right big toe was sensed the sedimentation rate had fallen to 12 mm. and a second electrocardiogram revealed a slight depression in the height of the T waves in the three conventional leads.

No further acute manifestations were seen during the remainder of the hospital stay and the contemplated use of cinchophen was not effected. The sedimentation rate varied between 22 mm. and 60 mm. per hour the blood uric acid determinations were 3 6, 3.9 and 4.7 mg per cent, the serum uric acid content was 6 5 mg. per cent the coagulation band (Weltmann) was read at 7 0 7 5, 8.0, and 7 5 the urinary excretion of uric acid was 82 mg per cent when examined during the ingestion of sodium salicylate. A carbohydrate tolerance test using 50 Gm of glucose orally showed the following values fasting, 97 mg. per cent first hour 184, second hour, 170 third hour 167 fourth hour, 98. The basal metabolism test was found to be minus 19, the blood cholesterol 355 and 241 mg per cent, blood calcium, 10 1 mg. per cent blood phosphorus, 1 7 mg per cent, phosphatase, 3.2 units (Bodansky) nonprotein nitrogen 30 mg per cent, urea nitrogen 10 5 and 19 mg per cent. The urine analysis was negative, the prostatic smear did not reveal any

* Home address, 97-38 110th Street, Richmond Hill Queens, New York

organisms, undulant-fever agglutination test was normal The electrocardiogram disclosed a left-axis deviation but the characters were within normal limits

X-ray studies of the gallbladder showed that its function was normal and intravenous pyelography likewise revealed normal shadows Roentgenographic examination of the heart did not demonstrate any enlargement or unusual outline The skull revealed a moderate number of symmetrical, irregular densities, particularly well seen in the inner table of the frontal bones Extracalvarial bony changes of the mandibles, except for prognathism, were not demonstrable The left big toe showed a punched out area at the base of the first phalanx The roentgen films taken of the hands were normal Shadows of the sella turcica were with out abnormalities or defects and the pineal gland did not appear calcified

A complete neurologic examination failed to manifest any central or peripheral nerve disturbances Psychologic studies were undertaken and on the Wechsler-Bellevue scales of mental ability,[17] the patient achieved a total standard score of 63, which is equivalent to an I Q of 77 and a mental age of 10 years and 5 months These results placed the patient in the "dull-normal" category of intelligence, slightly above the borderline-feeble-minded level (the patient completed only six grades of grammar school) The scores were higher in the verbal tests than in the performance tests The Shipley-Hartford Retreat scale for measuring intellectual impairment[18] or deterioration was administered and gave the following results vocabulary raw score, 18, vocabulary mental age, 12 3, abstraction raw score, 10, abstraction mental age, 10 5, total raw score, 28, total mental age, 10 9, conceptual quotient, (C Q) 84 *

Discussion

The outstanding manifestations of this syndrome of craniopathy are the triad of Morgagni—hyperostosis frontalis interna, obesity, and virilism[2]—and neuropsychiatric features of Stewart[19] and Morel [6] In a monograph that reviews an exhaustive investigation, Morel regarded the expressions of the disease as manifestations of endocrine, metabolic, and neuropsychiatric disturbances Additions to the literature amply serve to testify that the syndrome may reveal itself by a varied symptomatology This usually consists of the following elements calvarial hyperostosis (Moore described four types), obesity, sexual and menstrual changes in the female, gonadal deficiency in the male, hypertension, and neurologic and psychiatric aberrations For diagnostic purposes, however, it is not necessary that all of these manifestations, "with the exception of the pathognomonic roentgen findings of hyperostosis interna, be found in an individual case"[1] In this instance the obesity and internal frontal hyperostosis were the outstanding phenomena, although the family history of obesity was very suggestive It cannot be considered that the psychologic studies, as measured by the Wechsler-Bellevue scales and the Shipley-Hartford Retreat tests, pointed to an intellectual deterioration of the subject Particular attention was directed to personality changes, the emotional display and expressions that might betray depression, anxiety, drowsiness, or nervousness Tests were performed to detect muscular weakness, incoordination, and faults in gait or equilibrium, but the responses were always considered to be normal Interrogation failed to elicit complaints of fatigability, headache, diminished vision, diplopia, dizziness, defective hearing, memory loss, speech difficulties, increased desire to sleep, or narcolepsy Tenderness on pressure over the skull was not found, examination of the neurologic status failed to disclose any central or peripheral nerve defects, the ophthalmoscopic appearance of the retinal structures was normal The sex characters were of the ordinary male nature and there was no evidence of impaired gonadal function The obesity was limited to the face, neck, and the trunk, and a mild form of mammary enlargement was present The laboratory findings were consistent with those published by other authors decreased carbohydrate tolerance, varying high values for the cholesterol blood content, and normal blood calcium, phosphorus, and phosphatase determinations Although hypertension occurs more frequently than is encountered casually, it is by no means always present [20]
